

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

REPORT

—

The first part of the report deals with the general situation of the country. It is a very interesting and comprehensive survey of the country's resources, its population, and its economic and social conditions. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner. The second part of the report is devoted to a detailed study of the country's agriculture. It discusses the various crops grown, the methods of cultivation, and the problems connected with the industry. The author has also made a study of the country's stock-raising industry, and has shown how it is affected by the various conditions of the country. The third part of the report is devoted to a study of the country's industry. It discusses the various industries, the methods of production, and the problems connected with the industry. The author has also made a study of the country's commerce, and has shown how it is affected by the various conditions of the country. The fourth part of the report is devoted to a study of the country's education. It discusses the various schools, the methods of teaching, and the problems connected with the industry. The author has also made a study of the country's health, and has shown how it is affected by the various conditions of the country.

The report is a very valuable contribution to the knowledge of the country. It is a well-written and well-organized work, and it is a pleasure to read. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner. P R E F A C E .

IN the present volume of the *ANNUAL CYCLOPÆDIA*, the eighth of the New Series, some improvements have been introduced which it is hoped will add to its attractiveness and usefulness. The subjects treated have been subdivided with unusual care, and the use of full-face type for the heads and sub-heads brings them out more distinctly, and renders it easier for the reader to turn at once to the exact piece of information which he seeks. Increased attention has been given to illustration. The accounts of the wars in Egypt and Tonquin are each accompanied by a full-page map; another full-page map exhibits the annual rainfall in every part of the United States, and a colored map shows the new time-system recently adopted; there is a large view of the Cantilever Bridge at Niagara, one of the German National Monument on the Niederwald, and one of the new Capitol at Albany; the improvements in the use of gas and electricity are fully illustrated; and some strange and important discoveries in the aberration of sound as used for fog-signals are represented by curious diagrams. Portraits of the new Archbishop of Canterbury, Speaker Carlisle, Peter Cooper, Gustave Doré, General Gordon, Hicks Pasha, Mario the singer, General Sheridan, Alexander H. Stephens, Wagner the composer, and other celebrities, appear in their proper places.

The report of the proceedings of Congress has been made unusually full, as a means of ready reference to several subjects of national interest which will be discussed in the Presidential canvass of 1884.

A brief summary of the events of the year, in chronological order, is a new feature, serving to refresh the reader's memory as to numerous occurrences which could not be treated at length in a work like this. The paper on the "Composition and Nutritive Value of Foods," and that on the "United States Fish Commission," with instructions for the propagation and preservation of fish, will be found especially instructive and practical.

Mr. Alphonso A. Hopkins, Prohibition candidate for Governor of New York in 1882, gives a full history of prohibition, from the earliest times to the present day—a subject that is rapidly making for itself a place in political and legislative affairs; while the editor of the Salvation Army's publications gives an authoritative account of that strange movement in the religious world. The recent advances in chemistry, surgery, and other sciences are noted, and the present condition of each of the great denominations of Christians is set forth.

The articles "Failures in Business," "Financial Review of 1883," and "United States Finances," show clearly what has taken place in the monetary world. These and the numerous other articles, most of which, being subjects treated every year, need not be specially enumerated, constitute substantially the world's chronicle for 1883. Those who have just lived that year amid the crowding occurrences of our hurrying age, will realize, as they glance over the record, how letters in their simplest and humblest capacity, if they can not bring back the past, at least may double memory, and thereby lengthen life.

An index to the eight volumes (including the present) of the New Series will be found at the close of the book. An effort has been made to give it sufficient fullness to render all the information easily accessible, and yet not to overload it with needless entries that obscure the very things the reader is looking for.

In its proper place will be found a portrait and brief sketch of the late William J. Tenney, who edited this work from its beginning, in 1861, up to and including the volume for 1882.

NEW YORK, *April 11, 1884.*

THE ANNUAL CYCLOPÆDIA.

A

AFGHANISTAN. Abdurrahman Khan, since he was set up by the British as Amir of Afghanistan, has struggled vigorously to consolidate the Afghan state and maintain his rule over the loose league of turbulent clans which form the Afghan nation. After the withdrawal of the British army from Afghanistan, there was no hope of preserving a close control over Abdurrahman, for as a puppet of England he would immediately become impossible. As the British nominee, he was left in an exceedingly difficult position. The policy of the Imperial Government was, to attempt no dictation and make no exhibition of British power in Afghanistan, nor even inquire too closely into the loyalty and friendship of the Amir, yet to supply him liberally with money and war materials, at the expense of the Indian revenue, so as to enable him to buy or compel the submission of his vassals. "A strong, peaceful, and friendly Afghanistan" was the aim of this policy, the friendship to be won by large gifts and the renunciation of British claims to domination, which would encourage the Afghans to apply their united strength to resist Russian encroachments. Abdurrahman gained possession of the fortress of Herat, which is the bulwark of Afghanistan on the west, by a prompt military movement. His energy, or that of his lieutenants, broke up the seemingly formidable power of his cousin and rival, Ayub. Yet the undivided authority of the Amir was not established in Herat, nor can the Heratis be counted upon in future complications to remain true either to their allegiance to the Amir, or to their political union with Southern Afghanistan. Gen. Abdul Kudus Khan, who took possession of Herat in the autumn of 1881, after the defeat of Ayub, established himself there as unlimited ruler, and by the mildness of his government won the affections of the Herati people. Abdurrahman quickly re-established the sovereignty of the Amir in Turkistan, or Northern Afghanistan, as soon as he crossed

the Oxus. This great province, embracing the rich region on the northern slope of the Hindoo Koosh, was given into the hands of the Amir's cousin, Isa Khan, as a reward for his fidelity to the cause of Abdurrahman while he was still living as an exile in Samarcand. Isa Khan objected to the appointment of his former subordinate, Kudus Khan, to the governorship of Herat, which post he desired for his brother, Mohsin. Abdurrahman would have been glad to please his cousins and displace the dangerous officer who had implanted himself too firmly in Herat, but he dared not put his authority to the test. This caused an alienation between the Amir and his viceroy in Turkistan. Both the northern divisions of the country are thus ruled by governors who are able and ready to defy the commands of the Amir. The advancing influence of Russia finds there a field which the misdirected efforts and sacrifices of the British have helped to prepare for it.

In the southern parts of the country Abdurrahman has been but little more successful in consolidating his power. In Oabool he rules in state with the aid of British gold, and Candahar he holds with a tolerably firm hand. But the maintenance of civil order in garrisoned towns is a different thing from keeping in subjection and restraint the Afghan people, which is composed of warlike clans who have not yet passed out of the tribal organization of society, and who will accept none of the burdens and pay none of the duties of civil government, except to unite in repelling a foreign enemy. In 1888 the Shinwarris, a tribe inhabiting the eastern side of the Sufed Koh range, rebelled against the authority of the Amir. Abdurrahman sent a force to reduce them to subjection, but the military operations accomplished nothing except to spread disaffection, and the rebellious agitation extended to the neighboring clans, the Afridis and Momunda. The Government of British India came to the aid of the Amir with arms and ammunition. Some of these were intercepted

at the Khyber pass. The spirit of discontent began to pervade the great Ghilzai nation, upon whose loyalty the power of the Amir mainly rests. These warning signs impelled Abdurrahman not to strain his authority, and he accordingly withdrew the military and yielded to the demands of the Shinwarris.

The British, seeing the power of the Amir broken in the north and threatened in the south, and knowing that the treasure which they had given him three years before, with which he had established his position, was exhausted, thought they could strengthen his hands to maintain his power and at the same time secure his wavering and uncertain attachment by coming to him in the hour of his need with the promise of a stated annual allowance sufficient to support his power and state. Pecuniary gifts and subsidies have been a feature of British policy in Afghanistan from the beginning. Dost Mohammed received, by the treaty of 1858, twelve lacs of rupees per annum during the war with Persia, besides large occasional presents of money and arms. Shere Ali was the recipient of lavish gifts of money and munitions of war, and a treaty to bestow on him a subsidy of twelve lacs a year was in negotiation when his secret understanding with Russia was discovered, and was declared. Sir Louis Cavagnari, whose murder created a fresh rupture, was the bearer of an offer to Yakub Khan of half that amount per annum. When the British set Abdurrahman on the throne, they supplied him with treasure to the amount of over thirty lacs of rupees, or nearly a million and a half of dollars. The offer now made to Abdurrahman by the Indian Government, and accepted by him, was twelve lacs of rupees per annum. The payment of this large subsidy is conditional on his conforming his external policy to the wishes and interests of the British Empire.

ALABAMA. State Government.—The following were the State officers during the year: Governor, Edward A. O'Neal, Democrat; Secretary of State, Ellis Phelan; Treasurer, Frederick H. Smith; Auditor, Jesse M. Carmichael; Attorney-General, Henry O. Tompkins; Superintendent of Public Instruction, Henry C. Armstrong. Judiciary, Supreme Court—Chief-Justice, Robert O. Brickell; Associate Justices, George W. Stone and H. M. Somerville.

Legislative Session.—The Legislature, which was in session at the beginning of the year, adjourned near the close of February. Perhaps the most important act of the session was one "to provide for the assessment and collection of taxes for the use of this State and the counties thereof, and to define the duties of officers engaged about the said assessment and collection of taxes."

It provides a complete system, and contains stringent provisions requiring individuals and corporations to make return by specific items of their property, and special provisions relating to railroad, telegraph, and telephone companies.

Another systematic act fixes the rate of poll and other taxes, the amount and kind of license fees, and defines the classes of taxable property. By an act "to establish a Department of Agriculture for the State of Alabama," a department of agriculture is created and established "which shall be under the management and control of the Commissioner of Agriculture, who shall be a practical and experienced agriculturist. Said commissioner shall be appointed by the Governor, and shall hold his office for the term of two years, and until his successor is appointed and qualified."

An act "to assist the University of Alabama, and the State Agricultural and Mechanical College, in furnishing additional room for students and facilities for instruction," appropriates the sum of \$90,000. It was further enacted that "landlords of storehouses, dwelling-houses, and other buildings shall have a lien for rent, upon such goods, furniture, and effects as may belong to the tenant, and that this lien shall be a superior lien to all other liens on said goods, except for taxes."

An act "to prevent monopolies in the transportation of freight, and to secure free and fair competition in the same," provides that "it shall be unlawful for two or more railroad companies or persons operating railroads in this State to enter into any agreement among themselves, directly or indirectly, for the division among themselves of the freight-carrying business at any station, town, or city in this State, or into any pool arrangement among themselves of the nature and character aforesaid, the object, purpose, and effect of which in either event shall be to prevent free and fair competition among said railroad companies or persons operating said railroads, for said freight-carrying business, and to establish extortionate rates in favor of said companies or persons in doing said business, and which shall have the effect of being in undue restraint of the trade and business at any such station, town, or city of this State"; that "it is the true intent and meaning of this act that any such agreement rates or pool agreement made by any convention or association of freight agents, or commissioner of freight rates or rate-making committee outside of this State, but to be performed in whole or in part in this State, shall as to such part of the same as is to be performed within this State, come within the provisions of this act."

Other acts were entitled as follows:

To regulate the hiring and treatment of State and county convicts.

To regulate the business of co-operative and mutual aid and relief associations, societies, and corporations.

To amend an act to revive and complete the Geological and Agricultural Survey of the State of Alabama.

To provide for the introduction of the study of the laws of health in the public schools of this State.

To authorize railroad companies organized under the general incorporation laws to extend their lines and build branch roads.

To vacate and annul the charter and dissolve the

corporation of the city of Selma, and to provide for the application of the assets thereof to the payment of the debts thereof.

To prevent cruelty to animals.

To empower the Railroad Commission of Alabama to recommend joint local rates on freight to railroad companies and persons operating railroads in this State.

To provide for the comfort and accommodation of passengers at each of the passenger depots along the line of every railroad operated by every railroad company in this State.

To provide that a determination of any matter by the Railroad Commission within its jurisdiction shall be *prima facie* evidence that such determination was right and proper, etc.

To confer police powers upon the conductors of passenger-trains in this State.

To make appropriations for the payment of the railroad commissioners and their clerk, and for other expenses of the Railroad Commission.

To incorporate the inhabitants and territory formerly embraced within the corporate limits of the municipal corporation, since dissolved, styled the city of Selma, and to establish a local government therefor.

To authorize private corporations to hold stockholders' and directors' meetings outside of this State in certain cases.

The amount of appropriations for the fiscal year was \$1,120,435.

Statistics.—The total taxable property in Alabama in the year 1881, on which the tax for the fiscal year ending September 30, 1882, was collected, is \$152,880,069.24. Of this amount the railroads of the State furnished \$17,574,533. The total railroad mileage in Alabama is, main track, 1,788 miles; side-track, 131 miles—1,919 in all. The total valuation of track is \$15,801,829.78; of rolling-stock, \$1,762,753.89. The average value of the main track is \$8,643 per mile. Of the several railroads in the State, the Nashville and Decatur has the highest valuation, it being \$14,000 per mile. Of the whole taxable property, the railroads furnish over 11 per cent. Variations in land values, shown by the Auditor's report, are as numerous as the counties in the State. In Baldwin, the value is 65 cents per acre. Even in so rich a county as Barbour, the valuation is only \$3.50 per acre; in Cherokee, \$4.50; in Escambia, less than 50 cents; in Etowah, \$6.50; in Limestone, \$5.11; in Lowndes, \$5.06; in Madison, \$6; in Marshall, over \$4; in Washington, less than 50 cents.

The whole tax raised on property that reached the Treasury in the fiscal year ending September 30, 1882, was \$651,156.83. Of this amount the five counties in the State paying over \$20,000 apiece contributed \$254,351.56, or 39 per cent. The amounts paid by each of these counties were as follow:

Mobile.....	\$32,917 23
Montgomery.....	71,079 84
Dallas.....	86,593 23
Jefferson.....	27,256 85
Madison.....	25,584 41

The county coming next to these, but paying less than \$20,000, is Barbour, with \$19,185.30. The amount of licenses paid by these five counties is \$25,998.90, or 36 per cent of the whole amount of license-tax. The amount

of tax retained in these five counties for the school fund, which of course never reached the State treasury, was \$48,435.25, or over 19 per cent. of the whole school fund.

Adding to the tax of the counties mentioned that of Barbour, Bullock, Jackson, Lowndes, Talladega, and Tuscaloosa, all of which pay over \$15,000, we have the eleven counties in the State which pay over \$15,000 in direct taxes, paying considerably more than half the entire property-tax of \$651,156.83. The black belt is still by far the richest portion of the State, especially if we include those black counties which are not in the black belt proper.

The entire tax paid by Montgomery county, for general purposes, for the school fund, from licenses and from general taxes, aggregated \$98,888.75. The whole amount paid by Mobile county was \$109,620.64. The next highest was Dallas, with \$40,988. Of the \$651,156.83 paid into the treasury from the tax on property, Montgomery and Mobile paid \$164,976.57, or about one fourth.

Congressional Election.—On the 2d of January, Gen. Joseph Wheeler was elected, by a majority of 3,846, to fill the vacancy in the 8th district, caused by the death of Mr. Lowe.

Miscellaneous.—In February, Walter L. Bragg was chosen President of the Railroad Commission. James Crook and Charles P. Ball were chosen members. In January, State Treasurer Isaac H. Vincent absconded, leaving a deficit of about \$212,000.

AMSTERDAM EXPOSITION. See WORLD'S FAIR AT AMSTERDAM.

ANGLICAN CHURCHES. An exhibit of the work of the Church of England, and the various societies co-operating with it, is given in "The Official Year-Book of the Church of England," the first volume of which was published in 1883, under the sanction of the Archbishops and Bishops of the English, Irish, and Scottish Churches, and of the lower house of the Convocation of Canterbury. The present number of dioceses in the Church of England, including the two archdioceses, is thirty-two. With them are connected 17,970 clergymen, of whom 11,186 are registered as "incumbents resident," 1,509 as "incumbents non-resident," 887 as "curates in sole charge," and 4,888 as "assistant curates." In communion with the Church of England are the Church of Ireland, having twelve dioceses; the Episcopal Church of Scotland, having seven dioceses; sixty colonial dioceses in America, Asia, Africa, Australasia, New Zealand, and other colonial settlements, and the Protestant Episcopal Church in the United States. (See the article on PROTESTANT EPISCOPAL CHURCH.) The official records of the several dioceses of the Church of England show the number of ordinations to the order of deacons, during the ten years ending in 1881, to have been 6,560. The number of confirmations during the same period was 1,471,718. Five general societies,

two of them dating from the last century, aid theological students requiring pecuniary help; besides which a few diocesan societies exist for the same purpose, and special funds are set apart in some of the theological schools. Special theological training is given at ten theological schools, besides the universities. The Society for Promoting the Employment of Additional Curates returns an income of £42,686, and supports, in whole or in part, 620 clergymen; the Church Pastoral Aid Society, existing with the similar purpose of increasing the number of clergymen and lay agents, returns an income of £55,659, and maintains, wholly or in part, 540 clergymen and 168 lay agents. Besides these societies and similar diocesan organizations, societies exist within the Church, whose object it is to support agencies supplementary to clerical work; and numerous special mission agencies are maintained in all the large centers of population, and among particular classes of workmen, wherever they are congregated; in the army and navy; among British seamen abroad, at seventy foreign ports; among the fishermen of the Mersey and the Thames; among navvies, or laborers on works of public improvement; among hop-pickers; among homeless and friendless women and girls and abandoned women; among emigrants collected at ports of embarkation preparatory to sailing; and among the miscellaneous populations of the lower classes in the larger towns and cities.

According to the report presented by Lord Hampton in the House of Lords in 1874, 1,727 churches and 27 cathedrals had been built, and 7,117 churches restored, from 1840 to that time, at a total cost of £25,548,708. According to a later return, the sum of £4,826,469 was spent in thirteen dioceses upon church building and restoration between 1872 and 1881. Among the larger funds in aid of this purpose are that of the Incorporated Church Building Society, which has expended for it £785,859 since 1818, and which granted £13,690 in 1881, and the Bishop of London's Fund, applicable to the diocese of London alone, of which £583,412 were spent during the eighteen years ending with 1881. The Ecclesiastical Commissioners were the means of securing through their own grants and the benefactions that were called out to meet them, between 1840 and 1880, a total increase in the incomes of benefices of £765,500, representing a capital sum of about £28,000,000; and during 1881 they made 347 grants, amounting to £26,270, to maintain assistant clergy in twenty dioceses. The Free and Open Church Association seeks to multiply free sittings in churches; to spread the doctrine that the offertory is an obligation "for which there is a direct scriptural warrant"; and to have the churches opened daily for private prayer. It is also prepared to receive and hold trust gifts for building, endowing, and repairing free-seated churches, and to accept in

trust, exercise, and dispose of the patronage of benefices.

The Church of England Temperance Society, formed in 1862, has organizations in twenty-nine dioceses, twenty-six of which return 2,443 branch societies. Steps have been taken in later years for making the cathedrals more accessible to the people, and introducing into them services adapted to popular wants, and for encouraging the employment of lay-readers and assigning them a recognized place in the service of the church. Much attention has also been given to the sending out of earnest men and persuasive speakers to interest the masses in religious concerns, or in the work of what are called "Parochial Missions." The Church Parochial Mission Society, organized in 1873, supports eight preachers, and reported, in 1881, that more than 500 missions had been held by its agents. Similar enterprises are sustained by a number of diocesan organizations. Nine deaconesses' institutions have been formed in different dioceses, as homes for women who will devote themselves to religious work and the care of the sick. They returned, in 1881, 190 nurses domiciled within them. The National Society for Promoting the Education of the Poor in the Principles of the Established Church has spent, since its formation, in 1811, more than £1,100,000 in furtherance of its object, involving, according to the statement of its secretary, an expenditure of at least twelve times as much from other sources, for the same end. In 1881 it returned 11,589 efficient church schools under government inspection, which afforded accommodation for 2,351,235 children, or more than half the school accommodation of the country. Thirty colleges have been established for the training of teachers, in which two thirds of the entire number of trained teachers in the country have received their professional education. Provision is made for the religious inspection of the schools under the direction of the bishops in the several dioceses, and for the regular examination of students in religious knowledge. A society of fellows of a college has been formed for the promotion of middle-class schools; and eight such schools provide for the education of more than two thousand boys and girls. The interests of Sunday-schools are cared for by the Church of England Sunday-School Institute, which publishes returns from 8,405 of the 14,466 parishes in England and Wales, of 16,498 Sunday-schools with 113,412 teachers and 1,289,273 enrolled scholars. The tendencies of modern thought which are described under the general term of "secularism" are opposed by the Christian Evidence Society, in which the Church co-operates with other denominations, and which works by means of conferences and meetings, sermons, lectures, open-air lectures, instruction of classes, publication and other agencies; and by the Christian Evidence Committee of the Society for the Promotion of Christian Knowledge.

Missionary Societies.—The principal foreign missionary societies of the Church are the "Society for the Propagation of the Gospel in Foreign Parts," which was organized in 1701 and has missions in all the British colonies among colonists and natives; the "Church Missionary Society for India and the East," organized in 1799, and having missions, chiefly to the heathen, in West, East, and Central Africa, Palestine, Persia, India, Ceylon, Mauritius, China, Japan, New Zealand, Northwest America, and the North Pacific coast and islands; the Zenana Missionary Society, affiliated with the Church Missionary Society, and laboring among women exclusively; the South American Missionary Society, founded in 1844, and having missions in the southern part of South America and among Indians of the Patagonian race; the Universities Mission to Central Africa, founded in 1859, especially to take care of Africans freed by the British Government from slavery, and having its center of operations at Zanzibar and in the neighboring regions of Africa; the Oxford Mission to Calcutta, organized in 1830; the Cambridge Mission to North India, formed in 1876; the Indian Church Aid Association, formed in 1880; the mission in the Diocese of Maritzburg, South Africa; the Melanesian Mission, begun in 1848; the Colonial and Continental Church Society, for providing clergymen, teachers, etc., for the colonies of Great Britain, and to minister to British residents in other parts of the world; and the Anglo-Continental Society, instituted in 1853, "to serve as an organ of the Church of England." Six special colleges or mission-houses exist for the training of missionaries, and twenty "Missionary Studentship Associations" have been formed in different dioceses.

The Colonial Bishopric's Fund was founded in 1841, to promote the growth of the Church in the colonies and distant dependencies of the British Crown, by securing the endowment of bishoprics in them. From its foundation to 1882 it had been the means of raising £635,311 toward the endowment of forty-one sees.

The London Society for Promoting Christianity among the Jews was founded in 1809, and has been distinctively a Church of England institution since 1815. It seeks to extend its labors among the people of the Hebrew race wherever they may be found, and has mission stations in England, Austria, France, Germany, Holland, Italy, Persia, Poland, Turkey, the Principalities, Asia Minor, Syria, and North America, with a special station, comprising schools, an inquirer's home, a house of industry, and a hospital at Jerusalem. It promotes the circulation of the Hebrew Bible, of a translation of the liturgy of the Church of England, and of controversial works, and maintains schools in London, Warsaw, Bucharest, and Jerusalem. It reports that 360 Israelites had been baptized at Warsaw before the mission was broken up, and 767 adults and 784 chil-

dren had been baptized in London up to 1881. Its missionaries estimate that there are now 2,000 Christian Israelites in London, and probably a thousand more in other parts of England, and that there are nearly 5,000 Jewish Christians in Prussia.

The ordinary increase of the Society for the Propagation of the Gospel in Foreign Parts for 1882 was £109,041. Including £38,571 additional of gifts for special purposes, the gross receipts were £142,612. The general fund had increased £7,805 in two years. Five hundred and twenty-seven ordained ministers were employed by the society, of whom 161 were laboring in Asia, 129 in Africa, 20 in Australia and the Pacific, 216 in America and the West Indies, and one in Europe. There were also in the various missions about 1,400 catechists and lay teachers, mostly natives, and about 300 students in colleges. An important change had been made in the constitution and administration of the society. A supplemental charter granted by the Crown had removed the various anomalies which in the course of 181 years had surrounded the ancient charter; and the incorporated members scattered over the whole country now possessed by representation that power in the conduct of the society's affairs which a very large proportion of them had not previously enjoyed.

The ordinary income of the Church Missionary Society for 1882 was £200,402; including in addition the special gifts, the gross receipts amounted to £225,231. The total expenditures were £215,488. Missionary work was carried on at 206 stations, under the agency of 227 European ordained missionaries, 244 native clergy, 44 European lay missionaries, 8,106 native lay agents. Of 182,000 native Christian adherents reported, 37,391 were communicants. New work had been taken up, or extended, at the Afghan frontier, at Kok-Ning-Fu in the Fuhkien province of China, among the Esquimaux, at Bagdad, and at Cairo, Egypt, to the Mohammedans. A gift of £72,000 had been received from Mr. W. C. Jones for a "William Charles Jones China and Japan Native Church and Mission Fund."

Convocation of Canterbury.—Both houses of the Convocation of Canterbury met for business, for the first time in the year, April 10th. A minute was unanimously adopted in the upper house, with the expectation that the lower house would concur in it, taking notice of the death of the late archbishop. A "statement" was then made by the committee, to whom had been referred the question of the attitude the Church should assume with reference to the movements of the Salvation Army. The archbishop represented in behalf of the committee that it had not been found possible to make any definite statement or recommendation on the subject, as the committee considered that the movements of the organization were still in a transitory condition, and he suggested that the committee should be consti-

tuted as one of inquiry rather than as a committee to make any report or recommendation. In the course of the discussion which followed, while some of the bishops thought that the Salvation Army was doing a good work in particular places, and others conceded that its promoters were actuated by good intentions and motives, the general expression of opinion was, that many of the methods employed by it were unhealthful and likely to lead to immorality. The committee was reconstituted, and instructed to consider whether the Church should take any steps having particular reference to the unsatisfactory spiritual state of large masses of the population, especially in the towns.

The subject of the "Affirmation Bill," which was pending in Parliament, was brought before the lower house upon a recommendation of a committee that the members of the upper house be requested to oppose the bill. A motion was offered in amendment that their lordships be requested to watch the progress of the bill through the Houses of Parliament, in order to prevent its being enacted with retrospective powers. Some of the members of the house expressed a preference of affirmations to oaths, on grounds of principle. Canon Gregory contended that the real question was, whether the house was anxious to support the introduction into Parliament of Mr. Bradlaugh, or whether they were anxious to prevent people of that description from polluting the legislature of the country. Prebendary Stephens considered that oath-taking was most injurious, in that it had a pernicious tendency to cause a belief in two kinds of truth—oath-truth and ordinary truth. The proposal of the committee was agreed to.

The convocation met again on July 8d. The following address to the upper house was adopted in the lower house:

The lower house of Convocation of the Province of Canterbury, in humble thankfulness to Almighty God for the rejection by the House of Lords on Thursday, June 28, 1883, of the bill for legalizing marriage with a deceased wife's sister, make this their dutiful representation and prayer to the upper house.

They represent that there is reason to apprehend an immediate renewal of the agitation upon this question.

That, inasmuch as holy matrimony is the foundation of human society; and inasmuch as there is a wide-spread ignorance of the principles of Christian marriage, the lower house, as in love and duty bound, turns to the Archbishop and Bishops in Convocation assembled; earnestly praying them to exhort all who have cure of souls in the province of Canterbury to set forth plainly, from time to time, in their addresses to their flocks the aforesaid principles; as embodied in the Table of Prohibited Degrees, in the 99th Canon, and in the form of Solemnization of Matrimony; and, in particular, to remind their people that the union of a man with his wife's sister has been forbidden by the Church of Christ from the beginning, as being contrary to the Word of God.

The lower house venture further to call special attention to the injury which would be done to the moral and spiritual welfare of the English people; also to the disruption of domestic and social relations necessarily involved in the success of the agitation

above referred to; and, lastly, to the grave consequences which must ensue if the law of the Church and the law of the state be brought into open opposition.

The subject was referred in the upper house to a committee, whose report, which was adopted, besides minutely setting forth the considerations on which the action was based, embodied a resolution to the effect that "this house concurs with the lower house in their earnest desire for the maintenance in its integrity of the Table of Prohibited Degrees, set forth in the year of our Lord 1563, in order to be publicly set up in churches by the 99th canon." A resolution was adopted that the Church, "though always insisting on the use of wine in the holy communion, has never prescribed the strength or the weakness of the wine to be used, and consequently it is always possible to deal with even extreme cases without departure from the custom observed by the Church, and it is most convenient that the clergy should conform to ancient and unbroken usage, and to discountenance all attempts to deviate from it."

Enthronement of the Archbishop of Canterbury.—

The Rev. Edward White Benson, D. D., Bishop of Truro, having been nominated by the Queen, was formally elected Archbishop of Canterbury at a special session of the Dean and Chapter of the See, Jan. 28th. The election was confirmed by the Bishop of London and a commission of bishops of the Southern Province, March 3d. The new archbishop was enthroned with imposing ceremonies at the Cathedral of Canterbury, March 29th. The proceedings were participated in or witnessed by a large assemblage of clergy and laity, and home, colonial, and foreign bishops, among whom the Duke of Edinburgh represented the royal family, and Bishop Littlejohn, of Long Island, the Protestant Episcopal Church in the United States.

The Ritualistic Controversy.—The late Archbishop Tait, of Canterbury, a short time before his death, in December, 1882, had devised and partly carried into effect a plan for indirectly removing from the courts the suit against the Rev. A. H. Mackonochie, of St. Alban's, who was still under prosecution for contumacy, hoping that one of the results of his action might be to help allay the ritualistic agitation. He induced Mr. Mackonochie to resign his benefice in the interest of the peace of the Church, while the Bishop of London offered him another benefice, that of St. Peter's, London Docks, at the same time transferring the incumbent of that benefice to Mr. Mackonochie's former parish of St. Alban's. The Church Association refused to acquiesce in this proceeding. It published a statement showing that illegal acts were still practiced at St. Alban's and St. Peter's, and addressed resolutions of protest against the fulfillment by the Bishop of London of the compromise which had been arranged. The Bishop of London replied to these resolutions:

If, by refusing to accept Mr. Mackonochie's resignation, I had defeated the late archbishop's dying desire and effort to promote the peace of the Church, I could never have forgiven myself; nor could I have expected the forgiveness of the great bulk either of the clergy or of the laity of England, whether within the Church or without it. I am not aware that the bishop has the power to require from a duly qualified clergyman, the sufficiency of whose learning he has no reason to doubt, any conditions of admission to a benefice, when presented by the rightful patron, other than the production of testimonials signed by three beneficed clergymen and the oaths and declarations prescribed by law.

If there are those who, knowing as I do the good and self-denying work done among the poor and ignorant by such men as Mr. Mackonochie and the late Mr. Lowder, are yet, on account of differences in discipline and doctrine (the seriousness of which I do not wish to extenuate), unable to appreciate or afraid to acknowledge it, I can not sympathize with them—I can only pity them.

A memorial was addressed to the bishop by the Canons of Durham, Peterborough, Carlisle, and Ripon, and others, in which exception was taken to the institution of Mr. Mackonochie, because by reason of it the recent legal decisions against ritual (ritual openly acknowledged to be preparatory to the restoration of the sacrifice of the mass) had apparently been rendered nugatory; because by it disloyalty to the formularies, articles, and homilies of the Church of England had received tacit encouragement from her highest officers; because his lordship's action in the matter would appear to the public to be inconsistent with law and order; and because the illegalities of ceremony which had been practiced at St. Alban's would seem to them to have received episcopal sanction and approval. Hence a most injurious effect would be produced upon the Church and nation, and a strong weapon placed in the hands of the enemies of the Church of England, for the furtherance of their designs to procure its disestablishment.

Mr. Mackonochie was formally installed in the benefice of St. Peter's, London Docks, on Jan. 21st, when he read himself into the vicarship and subscribed to the Thirty-nine Articles of the Church of England.

The suit against Mr. Mackonochie, which had been before the law courts in various phases for nearly fifteen years, was continued, notwithstanding the exchange of benefices which it was hoped would lead to a cessation of proceedings. The final judgment in the case, by Lord Penzance, was given July 21st. The question before his lordship was now whether Mr. Mackonochie should be deprived of all ecclesiastical promotions in the province of Canterbury. The defendant had been admonished by the Court of Arches repeatedly for his illegal ritualistic practices at St. Alban's, Holborn, and had treated the orders of the court with contempt. He had therefore been ordered to be committed. In the mean time an exchange of livings had been effected between Mr. Mackonochie and the Rev. Mr. Suckling, incumbent of St. Peter's, London Docks. The case was remitted to the

Dean of Arches by the Judicial Committee of the Privy Council for a "definitive sentence" to be passed, it having been decided that a sentence of suspension would be inadequate, because it had once before been pronounced, and Mr. Mackonochie had discharged it, and that a sentence of deprivation was the only one applicable. In the present case, however, the issue was more complicated than usual, the ordinary form of sentence being inapplicable in consequence of the defendant having ceased to hold the living of St. Alban's, Holborn, in which the offense had been committed. The court had to consider whether a decree of deprivation had become impracticable by the course the defendant had adopted of resigning the benefice with respect to which the suit had been instituted. After a careful examination of authorities, Lord Penzance came to the conclusion that it had not. A deprivation of the defendant was then decreed from all his ecclesiastical promotions in the province of Canterbury, among which is included the living of St. Peter's, London Docks. An appeal may still lie to the Privy Council.

The parish of St. John's, Miles Platting, having become vacant by the deprivation of the Rev. S. F. Green for contumacy in ritualism, the patron of the benefice presented the Rev. Mr. Cowgill, Mr. Green's former vicar, for the incumbency. The Bishop of Manchester refused to institute Mr. Cowgill unless he would obligate himself to conform to the cathedral standard of services, and this Mr. Cowgill, in turn, refused to do. The patron notified the bishop that if he persisted in his refusal to institute Mr. Cowgill, he (the patron) would be driven to one of two alternatives: either to seek in a court of law to protect his right of patronage, which he had exercised to the best of his judgment, or to ask Mr. Green to receive back his resignation, the bishop having refused to accept it, and to take his old place at the rectory. The bishop replied that he saw nothing in the patron's letter to modify or change the resolution he had come to not to institute Mr. Cowgill, and added: "I deeply regret that it should be so; but there is a peace which may be too dearly purchased, and in my opinion it would be so in this instance if it were purchased by the surrender of all law and authority in the administration of the discipline of the Church of England." Addresses expressing sympathy with him, and satisfaction at his course, were sent to the bishop from different sources, to one of which he replied:

With you, in the course which I have felt it my duty to pursue, I "desire no party triumph." But the principle of obedience to law, when authoritatively declared, seems to me to need to be vindicated; and again I agree with you in thinking that to institute to a benefice a clergyman who would continue the same illegal ceremonial acts for which the former incumbent had been deprived, would be a stultification of the law which the common sense of the country would not tolerate. If I am wrong in my conception of my duty, the law, which is appealed to, will set me right,

and to its decision, when duly pronounced, I am prepared to bow. Meanwhile, I am anxious, as far as may be, without raising partisan passion or animosity, calmly to await that decision.

To another address he replied :

My course of action has not been dictated by any desire to strain the principles of episcopal authority, but simply to secure obedience to the law, as the only guarantee of the stability of our beloved church, and, indeed, of the rights and liberties of churchmen.

In May, the Archbishop of York issued a monition to the Rev. G. C. Ommanney, Vicar of St. Matthew's, Sheffield, directing him to discontinue eight specified ritualistic practices. The archbishop's requirements were as follow :

1. To use pure wine, and not wine mixed with water, in the holy communion.
2. To use ordinary wheaten bread in all celebrations of the holy communion, and not bread pressed so as to resemble wafer bread.
3. So to proceed in the acts of the holy communion that the congregation may see his acts.
4. To refrain from prostrating or bowing low over the elements at the time of celebration.
5. To refrain from making the sign of the cross over the elements at the time of celebration.
6. To discontinue the ceremonial of elevation of the paten and the cup.
7. To permit no person not licensed by the archbishop to officiate in any manner at the holy communion, whether such person be called server or by any other title; and
8. That the washing and cleaning of the vessels used in the holy communion shall not take place in the service, but in some place apart.

The observance of these rules was demanded in virtue of the vicar's promise of canonical obedience. Mr. Ommanney, in a published letter, declared that he did not intend to abandon the eastward position, the mixing of water and wine at the communion, and the washing of the chalice; but that, in order to promote peace in his parish, he was willing to give up making the sign of the cross and other practices that did not interfere with his conscientious convictions.

The Archbishop of York, in a letter to the church-wardens of the parish on the subject of the monition, pointed out that no person had a right to interfere and put a stop by force to ceremonies in churches.

Reorganization of Ecclesiastical Courts.—A royal commission was appointed in May, 1881, to inquire into the constitution and working of the ecclesiastical courts under existing statutes. The principal object of its work was to frame a plan for such a reconstitution of the courts having cognizance of ecclesiastical matters as would remove the objections entertained by a large party in the Church to having questions of doctrine and ritual decided by lay judges. An analysis of the report of the commission was published in August. The essential features of the scheme proposed in it are the establishment of an exclusively ecclesiastical jurisdiction in the courts of first instance and the postponement of the intervention of lay authority to the court of final resort. Under its provisions, the Diocesan Court and the Provincial Court, which were practically destroyed by the Public Worship Regulation Act, will be restored to their original vitality.

While by the Public Worship Regulation Act the co-operation in prosecution of three aggrieved parishioners was required as initiatory to the beginning of proceedings against a clergyman charged with offending in doctrine or ritual, the act proposed by the commission makes the right to begin an action open to any one, and unrestricted. It is then left discretionary with the bishop whether he shall allow the complaint to be prosecuted or shall stop it at once. If it is allowed to proceed, the bishop may, with the consent of the parties, deliver a final judgment; if this consent is not given, the case is carried before the Diocesan Court. This court will consist of the bishop, with the chancellor of the diocese, or some other person learned in the law, as legal assessor, and a theological assessor to be chosen for the occasion by the bishop, with the advice of the dean and chapter. From this court an appeal may be taken to the Provincial Court, where it may be heard, at the discretion of the archbishop, by the official principal of the province, or by the archbishop himself, with the official principal as assessor, in which case the archbishop is empowered to appoint any number of theological assessors, not exceeding five, to sit with the court. The theological assessor must be either a bishop within the province, or a professor, past or present, of one of the English universities. From the Provincial Court an appeal will lie to the Crown, which is to exercise its prerogative through an entirely new court, composed of "a permanent body of lay judges, learned in the law," of whom not less than five shall be summoned for each case, by the lord chancellor, in rotation. In doctrinal cases, this court may, only on demand of one or more of its members, consult experts, namely, the archbishop or bishops of the province, or of both provinces. The court shall not be bound to give the reasons for its decisions; but, if it does state its reasons, each judge shall deliver his own judgment separately; and only the bare words of the decree shall be legally binding. On this feature of the proposition, the report furnishes the explanation: "Considering how widely different a matter the legal interpretation of documents must often be from the definition of doctrine, we hold it to be essential that only the actual decree, as dealing with the particular case, should be of binding authority in the judgments hitherto or hereafter to be delivered, and that the reasoning in support of those judgments and the *obiter dicta* should always be allowed to be reconsidered and disputed." Should a clergyman refuse to obey the sentence of a church court, he is to be punished, not by imprisonment, but by a temporary suspension. A second disobedience shall be followed by another suspension, and disobedience for the third time by suspension until the court is satisfied. Disobedience to a sentence of suspension may be visited, after three months' notice, with deprivation; and any cler-

gyman who, during suspension or deprivation, attempts to conduct divine service in a church forbidden to him, may be charged with disturbance of public worship. The practical effect of the act, if it is adopted by Parliament, will be to repeal the Public Worship Regulation Act, and restore the old courts to their pristine vigor. By its provisions, the Dean of Arches is to be elected, and to be required to qualify in the ancient way. All spiritual sentences are to be pronounced by the bishop in person in the Diocesan Court, and by the archbishop in the Provincial Court. And the two primates are to be empowered, if they think fit, to appoint the same person as official principal for both provinces.

Some of the features of the scheme of the commission have been criticised in the discussions to which it has been subjected. Eight of the 28 members of the commission itself expressed objections to the power of vetoing the continuance of proceedings given by it to the bishop. Among these are the Lord Chief-Justice and the Archbishop of York. The archbishop remarked, in expressing his dissent, that under the operation of this rule the courts might be entirely closed to laymen. The Lord Chief-Justice, while he admitted that the power of prosecution might be liable to abuse, if no trammels were put upon it, thought it better to run the risk of abuse than to override the rights of the laity, and expressed himself perfectly confident that "competent judges, with absolute power of costs, would very soon restrain, and indeed altogether put an end to merely frivolous litigation." Similar objections were made by the Church Association, which devoted the entire session of its autumnal conference in October to the discussion of the report. Besides this point, a number of speakers at the Church Congress, and the chairman of the Church Association, offered objections to the feature of the constitution of the final court of laymen. The Executive Committee of the Liberation Society has published a statement of objections to the proposed measure. It deprecates the investment with judicial authority of bishops and judges appointed by the archbishops, so long as the Church continues to be a national establishment, and protests against the recommendation that the members of the courts shall declare themselves to be "members of the Church of England as by law established," as involving a civil disqualification on ecclesiastical grounds, as placing members of the Church of England on a different footing from Nonconformists in regard to the administration of justice, and as being inconsistent with the position of that Church as a national institution.

The Liberation Society.—The triennial conference of the Liberation Society was held May 1st. Mr. H. P. Richard, M. P., presided. The report represented that the friends of religious equality, who had waited during the abnormal pressure on Parliament, now claimed that the

question of disestablishment should be dealt with by the Legislature. The educational work of the society during the past three years had been carried on on a large scale. As many as 8,074,000 publications had been issued, and 1,247 meetings had been held. During the course of the meetings Mr. John Bright made a speech censuring the Established Church for inefficiency. He discussed the questions, Is the state the better for its union with the Church? or is the Church the better for its union with the state? The theory of many supporters of the union was that the Church tends to make the state more Christian—that is, more just and gentle, more merciful and peaceful. That theory the speaker declared to be "unsound and baseless." The bishops of the Established Church in the House of Lords had never exercised their influence in behalf of Christian and generous legislation. In respect to the criminal code, when it was most barbarous, the bishops and the clergy never raised a voice against the cruelty of the laws. The Church had provided no check, and uttered no denunciation of the country's incessant wars. "I complain, then," he added, "of the Established Church in this broad manner, that it does nothing to guide the state in the way of righteousness; that it is, in certain respects, the bond-slave of the state; that, in all the great matters which must affect our country, the bishops and the clergy are dumb, and their activity is shown only when any comparatively small measure is discussed which they think treads a little upon their position and their supremacy." He predicted a better future for the Church as a church, and as an object of popular affection, after it shall have been disestablished.

The Church Congress.—The Church Congress met at Reading, Oct. 2d. The Bishop of Oxford, being the bishop of the diocese in which the congress was held, presided, and delivered the opening address. He spoke of the subjects which would engross the attention of the meeting as being such as men of academic culture, serious thinkers, and ardent seekers after knowledge might properly discuss. The statement of them implied no foregone conclusion, and assumed no contradiction to exist between the great generalizations of science and the Christian faith. Believers in the one source of truth and life, the members of the congress could not conceive of any physical discovery which should destroy that faith; but they did not, therefore, separate themselves from the votaries of science, or ask them to be untrue to themselves; but rather believed that the seeming contradictions would disappear. The president also spoke of the subjects relating to social morality that were upon the programme of the congress, particularly on the one concerning the proposition to repeal the prohibition of marriage with a deceased wife's sister. He knew, he said, the bishops were threatened with expulsion from the House of Lords because they refused

to support a measure of which its friends could not give an intelligible account. He was not tenacious of temporal honors, and he hoped they would not forfeit their place by cowardice, political corruption, slavish adherence to a party, or subserviency to a court. He, however, "should feel no sense of shame if the bishops gave the vote which was fatal to themselves in defense of the purity of English homes, and the teaching of the word of God." Papers on "Recent Advances in Natural Science in Relation to the Christian Faith" were read by Prof. Flower, the Bishop of Carlisle, and the Rev. Aubrey Moore. The general expression of the discussion was to the effect that the newly developed theory of evolution, irrespective of its scientific value, which was regarded favorably, had nothing in it contrary either to the idea of an intelligent Creator or to the Bible. The Bishop of Carlisle affirmed that recent advances in natural science do not lead logically, and therefore ought not to lead at all, to either unbelief or atheism. The Rev. Aubrey Moore asked whether it is too much to believe that the time will come when we shall see in evolution, modified perhaps by wider knowledge—conditioned certainly by truths drawn from another sphere—a fuller revelation in nature than now seems possible for man of the wonderful works of God? On the subject, "Recent Advances in Biblical Criticism in their Relation to the Christian Faith," papers were read by the Rev. T. K. Cheyne on "Old Testament Criticism," by Prof. Sanday on "New Testament Criticism," and by Colonel Sir C. W. Wilson and Canon Rawlinson on "Historical Discovery."

Special interest was taken in the discussions on "the Marriage Laws," in view of the pending applications for relaxing the restrictions upon marriages of affinity. The speakers all opposed the relaxation sought.

The subject of "Ecclesiastical Courts" was discussed during two sessions, with especial reference to the report of the commission on the reorganization of those courts. Among the speakers were Dr. Hayman, Canon Trevor, Mr. Sydney Gedge, Lord Edward Churchill, the Rev. Dr. Porter, Prof. Burrows, of Oxford, the Bishop of Winchester, Mr. W. G. F. Phillimore, the Rev. Dr. Hay, of the Protestant Episcopal Church in the United States, and Mr. Beresford-Hope, M. P. Two points elicited differences of opinion. They were the proposed constitution of the Court of Final Appeal of Laymen, and the provision in the plan projected by the commission for allowing the bishop a veto on the initiation of proceedings in the courts. Other subjects discussed in the congress were the prevention of pauperism, "personal religion," education in the universities and in the public schools, and "the relations of the Church at home to the Church in the colonies and in missionary dioceses."

Woman's Work.—A session was given to the subject of woman's work in connection with

the Church. A suggestion by one of the speakers that women engaging in organizations for dealing with sorrow and misery should take vows of celibacy, was met by a proposition by the Bishop of Lincoln that the ceremony should be postponed till the women are sixty years old. The subject of the promotion of personal purity, and the prevention of the degradation of women and children, was considered in a private session.

Episcopal Synod of Canada.—The Anglican Church of British North America is divided into two provincial synods, one of which is composed of the Dioceses of Canada and the Maritime Provinces, with the Bishop of Fredericton as metropolitan; and the other, constituted in 1878, includes the Dioceses of the Northwest Territories, with the Bishop of Rupert's Land as metropolitan.

The Provincial Synod of Canada met in triennial session in Montreal, September 12th. The Dioceses of Nova Scotia, Quebec, Toronto, Fredericton, Ontario, Montreal, Huron, and Niagara, were represented by their bishops and by delegates. The Rev. Charles Hamilton, of Quebec, was elected prolocutor of the synod. The Central Board of Domestic Missions presented its first triennial report. It showed that the eight dioceses had during the past three years contributed \$84,896 to the work of domestic missions, and \$23,878 to the mission fund. The principal objects of missionary work were in Algoma and the Northwest. The Central Board of Foreign Missions reported that its receipts for the past three years had been \$6,748. The report of the board closed with a recommendation that it be amalgamated with the Board of Domestic Missions; and a proposition was introduced for the organization of a Domestic and Foreign Missionary Society of the Church of England in Canada. A memorial from the Diocese of Niagara requested the enactment of a canon for the promotion of greater uniformity in the rubric worship of the Church. The committee to which the subject was referred reported that it was at present impossible to frame in the dogmatic form of a canon what should be considered legal or illegal in the private ministrations of ritual, but that clergymen should be advised to submit to the ruling of their bishops in all matters connected with worship as to the legality of which doubts are entertained, or controversy shall have arisen. The Diocese of Montreal sent in a memorial, setting forth its claims to be the metropolitan see, averring that it had never ceased to protest against the action of the Provincial Synod in appointing another than the Bishop of Montreal as metropolitan, as illegal, and asking for a reconsideration of the question. No change was made in the present rule, which vests the selection of the metropolitan in the House of Bishops. A committee appointed to consider the subject of the employment of women in the work of the Church reported,

recommending the recognition of deaconesses and sisterhoods. Objection being made to the feature of sisterhoods, the synod, "adopting the principle of the desirability of making arrangements for the better employment of Christian women in the work of the Church," but without binding itself to the provisions of the report, referred it back to the committee to prepare a canon on the subject to be presented at the next session. Satisfaction was expressed at the success of the recent Church Congress, with the declaration that the organization and conduct of such bodies ought to be free from any synodical action.

The first Church Congress of the Episcopal Church in Canada was held at Hamilton in June. The Bishop of Niagara presided, and the meeting was attended by a number of clergymen from the United States. Among the subjects considered were those of clerical education, the attitude clergymen should occupy toward popular literature and recreation, "Lay Co-operation," "the Revised Version of the New Testament," "Modern Doubts and Difficulties," "Woman's Work in the Church," and "Church Music."

Anglican Churches in South Africa and Australia.—The question whether the Diocese of Natal, South Africa, shall be continued has been raised by the death of Bishop John William Colenso. Bishop Colenso was, in 1863, declared by the Bishop of Cape Town to be deposed from his office for certain heretical doctrines which he was found to have published. The validity of the act of deposition was not established, and the Colonial Assembly of Natal, in 1872, passed an act vesting in Bishop Colenso the property belonging to the See of Natal. In the meantime, the Diocese of Maritzburg had been founded in 1869, with jurisdiction extending over the colony of Natal, and conflicting with the jurisdiction claimed for the Bishop of Natal. If the bishopric of Natal were allowed to lapse, the conflict of jurisdictions would be quietly terminated. The authority of the Bishop of Maritzburg is recognized by the other South African dioceses, while that of the Bishop of Natal is acknowledged only by those immediately connected with the diocese. The Diocese of Natal includes seven clergymen, all but two of whom were ordained by Bishop Colenso after he was excommunicated, with fifteen churches, three of which are closed and two are connected with native work, while two are in the hands of the Diocese of Maritzburg. The latter diocese has thirty-four clergymen, seven of whom are missionaries to the heathen, while three others have native work, superintended by themselves, going on in their parishes; and thirty-two churches, seven of which are devoted to native work.

The bishopric of Sydney, which includes the metropolitanate and the Episcopal primacy of Australia, having become vacant, the Archbishops of Canterbury and York and the Bishops of Durham, Rochester, and Liverpool have,

on request, recommended the Rev. Canon Alfred Barry, D. D., Principal of King's College, London, as a suitable candidate for the office.

Anglican Church in Norway.—The foundation-stone of an English Episcopal church has been laid in Christiania, Norway. The ceremonies were superintended by Sir Horace Rumbold, the British minister resident at the court of Norway and Sweden, and were witnessed by the Norwegian Minister of State and other members of the royal government, and the ecclesiastical, military, and civil authorities.

ANTISEPTICS. See SURGERY.

ARGENTINE REPUBLIC. Area.—Since the settlement of the boundary question with Chili, in October, 1881, the Argentine territory embraces an area of 1,168,682 square miles. Before that settlement, the republic was credited with but 841,000* square miles (including the undisputed portion of the Gran Chaco), Patagonia having then been treated as a separate region.

Population.—In no other country in the western hemisphere, save the United States, has the population grown so rapidly as in the Argentine Republic. From 620,780 in 1836, it had reached 1,526,738 (an increase of 146 per cent.) in 1869; and in an official publication issued in September, 1882, it was estimated at 2,942,000, as follows:

PROVINCES, ETC.	Population.	Capitals.
LITTORAL OR RIVERINE PROVINCES.		
Buenos Ayres.....	907,000	Buenos Ayres.†
Corrientes.....	204,000	Corrientes.
Entre-Rios.....	188,000	Concepcion del Uruguay.
Santa Fé.....	187,000	Santa Fé.
ANDINE PROVINCES.		
Catamarca.....	109,000	Catamarca.
La Rioja.....	87,000	La Rioja.
Mendoza.....	99,000	Mendoza.
San Juan.....	91,000	San Juan.
CENTRAL PROVINCES.		
Córdoba.....	820,000	Córdoba.
San Luis.....	76,000	San Luis.
Santiago del Estero.....	158,000	Santiago del Estero.
Tucuman.....	178,000	Tucuman.
NORTHERN PROVINCES.		
Jujuy.....	66,000	Jujuy.
Salta.....	167,000	Salta.
TERRITORIES.....		
	112,000	
Total.....	2,942,000	

Of the total number of inhabitants, as given in that table, the classification by nationalities was as follows: 2,578,255 Argentine citizens; 123,641 Italians; 55,432 French; 59,022 Spaniards; 8,616 Germans; 17,950 English; and 99,084 of various other nationalities.

* Details concerning territorial divisions, population, etc., may be found in the "Annual Cyclopaedia" for 1872, 1877, and 1878.

† The new capital of this province, La Plata, was founded Nov. 19, 1852, on the banks of the river of the same name, and thirty miles southeast of Buenos Ayres, the latter city having been constituted the Federal capital by the law of Sept. 21, 1850.

The estimated population of the city of Buenos Ayres was, in September, 1882, 295,000; and those of other important cities as follows: Córdoba, 89,651; Rosario, 32,204; Tucuman, 24,287.

Immigration.—By the terms of the "homestead law," enacted Oct. 6, 1876, inducements were offered with a view to attract Europeans to the shores of the republic.*

In pursuance of a new decree of May 16, 1883, passage-money was advanced to 135 immigrants in that year. A new and prosperous colony in the fertile region surrounding Bahía Blanca, in southern Buenos Ayres, bids fair to make of that seaport at no distant day "one of the great centers of Argentine commerce." The already rapid growth of the settlement will be materially enhanced on the completion of the railway between Buenos Ayres city and Bahía Blanca, the northern half of which line is now in operation to Olavarría. Of the older colonies may be mentioned those of Santa Fé, sixty-eight in all, with an aggregate population of 55,143 (in 1883); and Entre-Ríos, numbering seventeen, with 9,905 inhabitants. The Santa Fé colonists, besides other products, harvested upward of 1,000,000 bushels of wheat in 1882.

The following table exhibits the nationality and number of the immigrants who landed at Buenos Ayres in 1879, 1880, 1881, and 1882:

NATIONALITIES.	1879.	1880.	1881.	1882.
Italians.....	22,774	18,416	20,506	29,537
Spaniards.....	3,423	3,113	3,474	3,520
French.....	2,149	2,175	3,612	3,332
English.....	783	683	1,149	826
Swiss.....	717	581	635	943
Germans.....	490	445	561	1,123
Austrians.....	1,760	879	495	673
Portuguese.....	23	84	73	103
Belgians.....	73	57	140	183
Danes.....	47	54	11	11
Dutch.....	7	..	10	5
Russians.....	15	8	84	26
Greeks and Turks.....	17	11	28	14
Americans.....	51	21	72	226
Various.....	364	292	648	410
Total.....	32,702	26,643	31,468	41,041

The number of arrivals for 1883 was 68,325.

Government, Public Officers, etc.—The President of the Republic is Lieut.-Gen. Don Julio A. Roca (inaugurated Oct. 12, 1880), and the Vice-President, Don Francisco Madero.

The Cabinet was composed of the following Ministers: Interior, Don Bernardo de Irigoyen; Foreign Affairs, Don Francisco Ortiz; Finance, Don Victorino de la Plaza; Justice, Public Worship, and Public Instruction, Dr. Eduardo Wilde; War and the Navy, Gen. Don Benjamín Victorica.

The governors of the several provinces, etc., were:

Buenos Ayres.....	Dr. D. Rocha.
Catamarca.....	Don J. Acuña.
Córdoba.....	Don G. Gavler.
Corrientes.....	Don A. Soto.
Entre-Ríos.....	Col. J. Antelo.

* An abstract of this "homestead law," or "colonization bill," was given in our volume for 1877, p. 29.

Jujuy.....	Don E. Tello.
La Rioja.....	Don B. Jaramillo.
Mendoza.....	Don J. M. Segura.
Salta.....	Don M. S. Ortiz.
San Juan.....	Don A. Gil.
San Luis.....	Don Z. Concha.
Santa Fé.....	Don M. Zavalla.
Santiago del Estero.....	Don L. G. Pinto.
Tucuman.....	Don B. Paz.
Gran Chaco Territory.....	Col. F. Bosch.
Patagonia.....	Col. L. Winter.
Misiones.....	Col. E. Roca.

The Argentine Envoy Extraordinary and Minister Plenipotentiary to the United States is Dr. Don Luis L. Dominguez (accredited in 1882); and the Argentine Consul-General (at New York) for the American Union, is Don Carlos Carranza.

The United States Minister Resident in the Argentine Republic is Gen. Thomas O. Osborn; and the United States Consul at Buenos Ayres is Mr. E. L. Baker.

Army.—The Argentine army in June, 1883, comprised, exclusive of the National Guard, 6,787 men, as follows: 8,500 foot, 2,474 horse, and 815 artillery. There were 4 lieutenant-generals, 14 generals of division, 50 colonels, 127 lieutenant-colonels, 142 majors, and 742 officers of other grades. The National Guard was 815,850 strong. The military academy had, in 1882, 14 teachers and 123 students; and the military school (for non-commissioned officers) 6 teachers and 68 pupils.

Navy.—The navy, in June, 1883, was composed of 39 vessels, namely: 3 steam-ironclads, 6 gunboats, 7 torpedoes, 2 steam-transport, 3 cruisers, 6 other steam-vessels, and 12 sail-of-the-line, with an aggregate tonnage of 12,630, and an armament of 55 guns, and manned with 1 rear-admiral, 2 chiefs of squadron, 8 colonels, 9 lieutenant-colonels, 9 majors, 120 captains, 32 lieutenants, 45 second-lieutenants, 63 students, 23 midshipmen, 20 paymasters, 48 engineers, 23 physicians, 2 almoners, 20 pilots, 1,505 seamen, 1,737 marines (including officers), and a torpedo division 137 strong. In the foregoing enumeration is not included the flotilla of the Rio Negro, comprising 3 steamers and 3 steam-launches.

The naval school had, in 1882, 17 teachers and 69 students; and another school, for seamen, had 9 teachers and 43 pupils.

The navy, like the army, is recruited by voluntary enlistment for a fixed period.

Education.—The cause of popular education continues to be zealously fostered by the Argentine Government, than which none has displayed more untiring energy in its efforts to insure the benefits of rudimentary instruction to the youth of all classes of society. In the budget for 1883 the cost of this department to the state was estimated at \$2,190,430.88.

There were in the republic, in 1882, 2,023 educational establishments of all grades, with an aggregate of 4,097 teachers, and a total of 136,928 pupils. Primary instruction was given, in 1881, at 1,985 schools, national, provincial, municipal, and private, by 8,544 teachers to 128,919 children. But as, from a bare statement

of the number of primary schools, no precise idea of the status of rudimentary education can be derived, the following comparative statistics are transcribed from the report of the Minister of Public Instruction for 1882: Assuming the population of the republic to be 2,500,000, and the proportion of the children between the ages of six and fifteen to be 20 per cent., we should have:

Children fit to attend school.....	500,000
Actual number attending public primary schools.....	99,968
Estimated number attending private primary schools.....	100,000
Estimated number home-taught.....	10,000
<hr/>	
Total number possessing or acquiring primary education.....	209,968
Total number illiterate.....	290,087
<hr/>	
Total.....	500,000

Yet these figures attest a notable improvement when compared with those for 1873, in which year but 81,183 children, out of a total of 468,987, attended school.

Finance.—Contrary to the almost general rule in Spanish America—witness Mexico, Costa Rica, Honduras, and principally Peru—the Argentine Republic, while rapidly extending her already considerable railway and telegraph systems, and otherwise facilitating transportation to and from the seaboard, not only accomplishes this without sacrifice to the national credit, but seldom fails to render such material improvements subservient to the financial prosperity of the country. Thanks to this system, and to punctuality in the service of the national debt and in the payment of interest thereon, Argentine bonds, first quoted at a premium in December, 1881, have rarely descended below par since that year.

The budget estimates for 1883 were: revenue, \$29,576,000; expenditure, \$31,224,749, whereby there would be a deficit of \$1,648,749.

The subjoined tables, which are transcribed from official returns published this year, exhibit the branches of the national revenue and expenditure, and the amounts of each, as estimated in the budget for 1884:

REVENUE.

Import duties.....	\$20,600,000	
Additional duties.....	670,888	
		\$21,270,888

The actual showing of the Finance Department for 1882 was unusually favorable; for, as Gen. Roca observes in his message to Congress in May, of a revenue of \$26,768,985.27, but \$25,854,996.76 were required for the ordinary expenditure of the administration. “The surplus, \$1,408,988.51, together with \$3,712,962.54, the proceeds of the treasury notes issued under the law of Nov. 3, 1881, the \$2,312,704.16 balance in the treasury at the end of that year, and other funds resulting from successful credit operations, was applied to reduce the balance overdue on our debt, thus placing the treasury in a position to discharge within a few days all our old accounts.” The consolidated national debt, according to the President’s statement, amounted on Dec. 31, 1881, to \$82,048,004.50, and to \$94,565,787.90 at the end of 1882, in which latter year the principal of the debt was reduced by \$3,625,257.13, and increased by new emissions to the amount of \$14,288,788.50. Gen. Roca affirms that the reduction just alluded to was a real diminution of the country’s indebtedness, while the fourteen million increase represented only the transformation of existing debts or the defrayal of productive outlays on works the yield of which would be more than sufficient for the amortization of the bonds emitted. “At the end of the present year” (1883), adds the President, “the 6 per cent. consolidated debt, with a small portion at 8 and 9 per cent., will have been reduced to \$75,418,201.31. The amount paid annually on the national debt (principal and interest) is \$8,979,061.51. Should the conversion * which I proposed to Congress last year be sanctioned, we should only require to dispose of 5 per cent. bonds to the amount of \$88,727,295.66, at the price of 85 per cent. (the rate taken as a basis by the committee on ways and means), for the extinction of those debts. And if the emission were made without a sinking fund for a term of twenty or twenty-five years, the annual service would only call for \$4,426,864.78. The advantages accruing from either of these plans are apparent, and would enable us to carry on numberless works of public utility without burdening future generations with such debts as have been handed down to us and were contracted to defray the expenses of wars abroad and internecine strife.” The President referred to the urgent need of a national bank law similar to that existing in the United States. Up to March 31, 1883, there were delivered

* See the “Annual Cyclopaedia” for 1881, p. 26.

from the mint 5,755,257 coins (gold, silver, and copper), representing an aggregate of \$4,154,519.16, and most of which was to replace the fractional paper currency, the withdrawal of which from circulation was decreed on Nov. 5, 1881.

The following tables exhibit the sources, destinations, and values respectively of the Argentine imports and exports for the year 1882:

FROM	IMPORTS.	Value.
Belgium.....		\$2,775,725
Bolivia.....		139,688

Other countries.....		8,812,322
Total (for 1882).....		\$58,446,905
Against (for 1881).....		56,069,104
Increase (in 1882).....		\$2,371,801

The exports and imports for the first ten months of 1883 were of the respective values of \$35,532,486 and \$50,176,456, against \$34,825,245 and \$41,217,972 respectively for the corresponding period of 1882.

The trade *in transitu* for 1882 was as follows:

COUNTRIES.	Inward.	Outward.
Bolivia.....	\$12,358,585	\$1,902,180
Brazil.....	55,655	1,387,059
Chili.....	105	9,457
Paraguay.....	83,138	568,680
Uruguay.....	1,585,690	870,158
Other countries (of Europe).....	2,977,749	18,050,408
Totals.....	\$17,057,917	\$17,057,917

Bolivia, now landlocked, finds a convenient channel for her foreign commerce through

Argentine territory, unburdened by any such tax as Peru used and Chili continues to exact, and with the great additional advantage of ready access to the Atlantic seaboard. In November, 1883, Bolivian explorers announced the navigability of the Pilcomayo river throughout, which circumstance, with the completion of the Northern Central Railway, will establish easy communication between the two countries. The export branch of this trade consists chiefly of bismuth, tin, silver, silver-ore, etc., while the imports are European manufactures.

Thus, the foreign commerce of the republic for 1882 was of the aggregate value of \$117,711,271, constituting an increase of \$7,612,518 as compared with 1881. On comparing the value of the imports and exports for each of these two years, it will be seen that the balance of trade for 1882 (\$829,461) was against, while that for 1881 (\$1,039,455) was in favor of the republic. It has been officially objected, however, that the unfavorable showing for 1882 is rather apparent than real, since of the value of the imports \$4,518,688 were for "articles of a productive character, such as railway materials, machinery for industrial purposes, and a large quantity of tools and agricultural implements." Among the more extensive consumers of Argentine products, as shown by the foregoing table of exports, France stands first, Belgium second, Great Britain third, Germany fourth, and the United States fifth. In the table of imports, those same countries range in the following order as shippers to the republic: Great Britain first, France second, the United States third, Germany fourth, and Belgium fifth. The imports from Germany, the United States, and Great Britain are steadily increasing, while those from Belgium and France fluctuate from year to year; and the exports to Germany and France, and particularly to the former, have increased, while those to the other three countries have fluctuated during the seven years 1876-'82.

Of the aggregate trade—imports and exports—of the republic with all countries for the septennial period 1876-'82, the subjoined table exhibits the proportions represented by each of the five countries just referred to:

Chief among the competitors of the United States, as a supplier of the Argentine Republic, is Great Britain.

The American articles shipped most extensively to the republic are: lumber (\$2,019,216 in 1882, against \$157,090 from Great Britain); agricultural instruments (\$528,046, the total from all countries having been \$727,807); keroseene (\$368,189); books and other printed matter (\$98,326); machinery (\$126,538); manufact-

COUNTRIES.	1876.	1877.	1878.	1879.	1880.	1881.	1882.
	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
Belgium.....	19.0	17.4	15.2	18.3	16.2	15.5	14.1
France.....	20.5	20.4	22.0	22.4	22.4	23.7	22.5
Germany.....	8.9	8.9	4.0	8.9	4.7	6.6	7.9

ured tobacco (\$120,839); clocks and watches (\$30,347, against \$24,006 from France, and \$14,926 from Great Britain). Of American musical instruments of all kinds, but \$5,989 worth were sent to the republic in 1882. American machinery is fast gaining favor, no fewer than sixty-two locomotives having been ordered of a single Philadelphia firm in 1882, while the total number imported from the United States in the year previous was but seven; and extensive orders for rolling-stock, particularly drawing-room cars, were also given in 1882. Indeed, there is a growing appreciation of things American in the Argentine Republic.

The imports of specie in 1882 were \$2,683,827, and the exports, \$2,225,082; against \$4,157,648 and \$2,991,305 respectively in 1881.

Chief among the Argentine export staples is wool; the quantity shipped in 1882 was 111,009,796 kilogrammes, of the value of \$29,038,000, against 89,259,122 in 1876. Next in importance after wool are hides, of which but 1,945,427, of the value of \$8,286,000, were exported in 1882, against 2,325,866 in 1876; then follow sheep-skins (22,858,021, of the value of \$4,095,000 in 1882, against 27,597,978 for 1876); jerked beef, 26,996,618 kilogrammes, \$3,756,000; tallow, \$2,699,000; maize, 107,827,155 kilogrammes, \$2,141,000; live cattle, 94,649, \$1,478,000; linseed, 23,351,794 kilogrammes, \$1,650,000; bones, ores, etc.

Agriculture, etc.—Until within a few years an importer, the Argentine Republic is now an exporter of wheat in constantly increasing quantities: 1,705,292 kilogrammes in 1882. Sugar-culture is rapidly developing in Tucuman, Salta, Jujuy, Santiago, Corrientes, and in parts of the Gran Chaco and Misiones. The total sugar-crop for 1882 was estimated at 11,615,000 kilogrammes. Tucuman now grows 17,500 acres of cane, giving work to thirty-four mills. The vine is extensively cultivated; Catamarca, in 1881, produced 1,200,000 gallons of wine, valued at \$108,000; and, in 1882, San Juan produced 5,236,186 gallons, valued at \$1,107,275. But the main sources of the country's wealth are cattle-rearing and sheep-farming. There were in the republic, at the beginning of 1883, 93,000,000 head of sheep, while Australia's flocks numbered but 73,000,000, and those of the United States, 41,000,000; of horned cattle there were 16,000,000 in the republic; and of horses, about 5,000,000. The statistics of these industries, for the single province of Buenos Ayres, were given in the census returns of Oct. 9, 1881, as follow: Sheep, 57,838,078; horned cattle, 4,754,810; horses, 2,396,469; hogs, 155,184; goats, 7,612.

Shipping Movements.—The shipping movements at the various ports of the republic were as below, in 1882:

FOREIGN TRADE.	
Entered:	
Steamers,	3,040, with an aggregate of 1,104,927 tons.
Sailing-vessels,	3,061, " " 423,127 "
Cleared:	
Steamers,	2,742, " " 1,050,314 "
Sailing-vessels,	2,023, " " 387,925 "

The distribution of the foreign carrying-trade by flags was as follows: British, 31 per cent.; French, 16; Argentine, 13; Italian, 9; Uruguayan, 9; German, 6; Brazilian, 4; Norwegian, 4; Spanish, 8; American, 2; Belgian, 1; others, 2.

COASTING AND FLUVIAL TRADE.

Entered:		
Steamers,	6,002, with an aggregate of 1,251,468 tons.	
Sailing-vessels,	15,725, " " 473,465 "	
Cleared:		
Steamers,	6,012, " " 1,293,538 "	
Sailing-vessels,	16,195, " " 500,838 "	

The distribution of this trade by flags was: Argentine, 57 per cent.; British, 24; French, 9; Uruguayan, 3; Paraguayan, 2; others, 5.

"We have no merchant navy," writes a native statistician, "unless that name be given to a few hundred barges, lighters, and schooners, which, with Italian and Austrian crews, ply on our rivers and carry the Argentine flag just as they might carry the Turkish."

Railways.—The railways in operation, and in process of building, at the end of 1883, were as follow:

LINES.	In operation.	
	Kilometres.	Kilometres.
Central Argentine (Rosario to Córdoba) ..	396	...
Northern Central (Córdoba to Tucuman) ..	846	...
Northern Central (Tucuman to Jujuy)....	...	840
Northern Central (branch from Frías to Santiago).....	...	162
Northern Central (branch from Escezo to Chumbicha)*	800
Andine (Villa María to La Paz)	470	...
Andine (La Paz to San Juan <i>viz</i> Mendoza)	225
Western (Buenos Ayres to Bragado, and branches to Pergamino and Lobos).....	515	...
Western (extension)	856
Southern (Buenos Ayres to Altamirano, and branches to Olavarría and Tandil) ..	679	...
Southern (Olavarría to Bahía Blanca).....	...	856
Northern (Buenos Ayres to El Tigre).....	85	...
Ensenada (Buenos Ayres to Ensenada)....	58	...
Campana (Buenos Ayres to Campana).....	81	...
Eastern (Concordia to Celbo).....	160	...
Puerto Ruiz and Gualeguay	10	...
Rosario to Candelaria	60
Transandine † (Mercedes in Buenos Ayres to Mercedes in San Luis).....	...	578
Santa Fé-Colonial.....	...	100
Totals.....	2,950	2,567

Tramways.—At the end of 1882 there were in the capital five tramway or horse-car lines, which, covering an aggregate of 95 miles, and with 1,001 employés, carried an average of 51,740 passengers daily. There were also lines in some of the smaller towns of the province of Buenos Ayres; Córdoba city had two lines, and Rosario one.

Telegraphy.—The total length of the Argentine telegraph lines at the end of 1882 was 13,543 kilometres, of which 10,772 belonged to the Government; there were 202 offices, and the number of dispatches transmitted throughout the year was 509,928, of which 71,838

* From Chumbicha the line is to be extended southwest to La Rioja, and northeast to Catamarca.

† This line will open direct communication between Buenos Ayres and Santiago, the capital of Chili, and so between the Atlantic and Pacific Oceans.

were official. By Dec. 31, 1888, 1,727 additional miles of Government line were completed.

Telephone.—In December, 1882, there were two telephone companies in Buenos Ayres, with 1,500 subscribers.

Post-Office.—In 1881 the number of letters that passed through the post-office was 9,723,740, of which 2,380,065 were official; and that of packages of printed matter, 6,182,874, of which 1,191,046 were to or from foreign countries.

Improvements.—The much-needed work of improving the condition of the ports, which is "still almost the same as at the arrival of the first Spanish settlers," says President Roca, was continued actively during the past year. The canalization of the Riachuelo, at Buenos Ayres, was sufficiently far advanced in January, 1888, to admit vessels of 1,120 tons register, and the intention is to prepare the harbor for craft of all sizes.

ARIZONA. Territorial Government.—The following were the Territorial officers during the year: Governor, Frederick A. Tritle; Secretary, H. M. Van Arnan; Chief-Justice of Supreme Court, Charles G. W. French; Associate Justices, Wilson W. Hoover and Daniel H. Pinney.

General Condition.—During the past two years the advancement of the Territory, both with regard to wealth in the development of profitable industries and increase of population, has been remarkable. The Territory can now claim 75,000 people and over \$20,000,000 of taxable property; and while the progress of its civilization and the development of its resources have been opposed by most serious difficulties, it is now safe to say that those dangerous and disturbing elements are well under control. During the past two years exceptional development has been made in all industries, mining, grazing, and agricultural; extensive railroad enterprises have been successfully completed; and the affairs of the Territory generally are exceedingly prosperous.

The great natural facilities of the country for stock-raising and wool-growing are beginning to be understood, and large droves of cattle and sheep are being driven in from the neighboring States and Territories.

The valleys along the principal water-courses yield magnificent crops of grain, fruits, and vegetables, and even the *mesa* or table-lands adjacent will grow almost everything with a sufficient water-supply. The valleys of the Gila and Salt river are being rapidly settled.

Beyond the making of flour and lumber the manufacturing interests of the Territory are in their infancy. Some of the native plants furnish excellent material for the manufacture of paper, coarse cloths, mats, ropes, and other articles. No attempt has been made to utilize this raw material, although it is known that the aborigines have succeeded, in their crude way, in making ropes of fair quality.

Mining.—Since the building of the Southern Pacific Railroad, mining has made rapid progress, and now Arizona stands second on the list of silver-producing States and Territories.

Eight years ago the bullion yield of the Territory was but a little over \$100,000, while now it stands third on the list in its yield of the precious metals.

According to the best information at hand, the production of Arizona in gold and silver for the four years ending Dec. 31, 1882, was as follows:

1879	\$1,942,408	1881	\$8,193,768
1880	4,472,471	1882	9,299,267

A large quantity of rich ore and base bullion which finds its way out of the country is not included in the above. It is safe to estimate the value of such ores and bullion at 10 per cent. of the figures given.

From careful estimates it is believed that Arizona's yield of gold and silver for 1888 will exceed \$12,000,000.

As near as can be ascertained, the copper yield of the Territory for the past three years has been as follows:

	Pounds.		Pounds.
1880	2,000,000	1882	15,000,000
1881	5,000,000		

The estimated yield for 1888 has been placed at from 20,000,000 to 25,000,000 pounds.

The combined value of the silver and copper product for 1888 will be between fifteen and sixteen million dollars.

Agriculture and Grazing.—Irrigation is necessary to the raising of a crop in Arizona. It is estimated that there are at the present time between 60,000 and 70,000 acres under cultivation in the Territory, and that the quantity of grain (wheat, barley, and corn) produced during the year was nearly 60,000,000 pounds. In the valleys of the Gila and Salt rivers alone there are 400,000 acres which can be brought under cultivation, of which only about one tenth is now utilized. Two crops a year can be grown. After the wheat or barley is harvested, corn is planted. There are at present about 30,000 acres under cultivation along the Salt river, yielding, in 1888, 14,000,000 pounds of wheat, and 18,000,000 pounds of barley. Of fruit-trees there are nearly 40,000, and over 300,000 vines in bearing. Alfalfa is sown extensively, and yields three cuttings during the season, averaging two tons to the acre at a cutting. The number of cattle in the Territory is about 280,000, an increase of more than 300 per cent. during the past two years. It is estimated that the area of grazing-land in the Territory will reach 60,000 square miles. The country north of the thirty-fourth parallel is well adapted to the raising of sheep. The number of sheep in the Territory is placed at 800,000, and the yearly clip at 2,400,000 pounds.

As near as can be ascertained, the number of horses, mules, and hogs in the several counties is as follows:

COUNTIES.	Horses.	Mules.	Hogs.
Yavapai	10,000	2,000	1,000
Maricopa	5,000	2,000	7,000
Cochise	4,000	3,000	500
Graham	3,000	1,000	500
Pinal	2,000	1,000	600
Gila	1,000	800	300
Yuma	800	300	200
Mohave	1,000	500
Pima	6,000	2,500	1,000
Apache (no data)
Total	82,800	12,600	11,100

The School System.—No Territory of the Union has a better school system than Arizona. All children of school age are compelled to attend the public schools, and the expenses are borne by a direct tax on the people. A superintendent is elected every two years. In each county the probate judge is *ex-officio* superintendent of the schools of his county. According to the latest census, the number of schools was 97.

The total revenue for school purposes in the Territory, for 1882, was \$101,967.85.

There are many small communities that fail to receive any advantage from the school fund, owing to the necessity of only organizing schools with a large number of pupils. The number of children of school age is nearly 10,000.

Railroads.—Arizona is now in possession of two transcontinental railroads. The Southern Pacific enters the Territory at Yuma, and crosses nearly along the line of the thirty-second parallel. Its length through the Territory is 389 miles. From Benson, 40 miles east of Tucson, the Arizona and New Mexico Railroad branches from the Southern Pacific and runs southward to Guaymas, on the Gulf of California. The length of this road through Cochise and Pima counties is about 65 miles. The Atlantic and Pacific Railroad begins at Albuquerque, New Mexico, and strikes westward, following very nearly the line of the thirty-fifth parallel, to Colorado river. Its length through the Territory is about 350 miles. This road opens up the great coal-beds and the grand timber-belt of the Mogollon mountains. This great forest is nearly 200 miles in length by 60 in width, and contains some of the finest timber in the United States. There is also the Clifton and Lordsburg road, now nearly completed, running in this Territory a distance of about 60 miles, and furnishing an outlet to a very rich mineral and grazing region. Other roads have been projected, and some are under way. In connection with these roads there is over a thousand miles of telegraph lines.

The Indian Question.—One of the greatest drawbacks to the prosperity of Arizona has been found in the hostile Apaches. Up to 1874 they terrorized the entire Territory, kept out immigration and capital, and had life and property virtually at their mercy. In that year they were placed on a reservation, where those of them who are not absent in Mexico yet remain. It was supposed that an end had been put to Indian troubles, but the raids of the

past two years have shaken the feeling of security.

There are in Arizona about 25,000 Indians occupying lands reserved to them by the General Government. A large part of them are self-supporting, although about 5,000 depend almost entirely upon the Government. The tribes occupying the Territory are the Hualapais, Yumas, Papagoes, Pimas, Maricopas, Mohaves, Navajos, Ava Supies, and Moquis; also various branches of the Apache family, who have been placed upon the San Carlos Reservation. With the exception, perhaps, of the Hualapais and Yumas, these Indian tribes occupy some of the finest spots in the Territory, covering a vast area. The Hualapais and Yumas occupy reservations that are almost entirely barren lands. The principal dissatisfaction upon the San Carlos Reservation came from the Chiricahuas, and in April, 1882, it resulted in an open rebellion. On the morning of April 19th Loco's band of Chiricahuas broke out, and, after killing the chief of police, entered the valley of the Gila, and it is estimated that sixty industrious citizens were killed. The military force of the Territory was so small and so scattered that the raid was continued almost without interruption until the Indians reached the boundary line between Arizona and Sonora. Gen. Wilcox, then in command of this department, moved his forces with great activity, and the General of the Army, as well as the Secretary of War, responded promptly by sending more troops into the field, and several engagements took place within a few miles of the Sonora line, in which a number of the Indians were killed.

The survivors, supposed to number about 500, took up their abode in the Sierra Madre mountains, in Sonora and Chihuahua, Mexico. They remained quiet until March, 1883, when a small number of them raided through South-eastern Arizona and Southwestern New Mexico, killed a number of citizens, and stole a large amount of property, returning to Mexico without receiving any punishment.

Gen. George Crook visited Sonora and Chihuahua and arranged with the authorities there to take a military force into Mexico for the purpose of capturing these Indians. He found them encamped in the Sierra Madre mountains, but upon his approach many of the fighting men fled. An engagement was had, and some Indians killed. Quite a large number of men, women, and children were captured. With these the general returned and placed them upon their reservation.

Lawlessness and the depredations of "cow-boys" and "rustlers," who at one time held portions of the Territory in a condition of terrorism, have succumbed in a large degree to law and order.

ARKANSAS. State Government.—The State officers during the year were as follow: Governor, James H. Berry, Democrat; Secretary of State, Jacob Frolich; Auditor, A. W. Files;

Treasurer, W. G. Woodruff, Jr.; Attorney-General, C. B. Moore; Superintendent of Public Instruction, W. E. Thompson; State Land Commissioner, W. P. Campbell. Judiciary, Supreme Court: E. H. English, Chief-Justice; W. W. Smith and John R. Eakin, Associate Justices. Chancellor, D. W. Carroll.

Legislative Session.—The Legislature met on the 8th of January, and adjourned on the 28th of March. The State was redistricted for congressional purposes as follows:

1st district, the counties of Randolph, Clay, Green, Lawrence, Sharp, Independence, Jackson, Craighead, Mississippi, Poinsett, Cross, Crittenden, St. Francis, Lee, Phillips, Deaha, and Chicot.

2d district, the counties of Dorsey, Lincoln, Grant, Jefferson, Arkansas, Monroe, Frairie, Lonoke, Woodruff, White, Faulkner, Conway, Pope, Van Buren, Stone, and Cleburne.

3d district, the counties of Polk, Howard, Sevier, Little River, Pike, Hempstead, Miller, Lafayette, Columbia, Nevada, Clark, Hot Spring, Dallas, Onachita, Calhoun, Union Bradley, Drew, and Ashley.

4th district, the counties of Crawford, Franklin, Johnson, Sebastian, Logan, Scott, Yell, Perry, Garland, Saline, Pulaski, and Montgomery.

5th district, the counties of Benton, Washington, Madison, Carroll, Boone, Newton, Searcy, Marion, Baxter, Fulton, and Izard.

An act was passed to provide for revising and digesting the statutes. Another act provides that "the charters and all the amendments thereto of all municipal corporations within this State, designated as cities of the second class and incorporated towns, may be surrendered, all offices held thereunto abolished, and the territory and inhabitants thereof remanded to the government of this State in the manner hereinafter provided."

An act was passed to establish the county of Cleburne from portions of Van Buren, Independence, and White counties.

An important enactment was the following:

That if any person believing himself to be the owner, either in law or equity, under color of title has peaceably improved, or shall peaceably improve any land, which upon judicial investigation shall be decided to belong to another, the value of the improvement made as aforesaid, and the amount of all taxes which may have been paid on said land by such person and those under whom he claims, shall be paid by the successful party to such occupant, or the person under whom or from whom he entered and holds, before the court rendering judgment in such proceeding shall cause possession to be delivered to such successful party.

The principal law of the session, relating to the liquor-traffic, provides:

That any person owning or using or controlling any house or tenement of any kind, who shall sell or give away or cause or allow to be sold or given away any alcohol, ardent or vinous spirits or malt liquors, any compound or tincture commonly called bitters or tonics, whether the same be sold or given away, openly or secretly, by such device as is known as "The Blind Tiger," or by any other name or under any other device, shall be guilty of a misdemeanor, and if any person shall obtain any such alcohol, ardent or vinous spirits, or malt liquors, or any compound or tincture commonly called bitters or tonics, in any house, room, or tenement so owned, occupied, or controlled by another, by going therein or thereto, and by call, sound, word, or token, it shall be *prima facie* evidence of the

guilt of the person who so owns, occupies, or controls such house, room, or tenement; or, if any persons are allowed to pass through or into any room or place so owned or controlled or occupied by another, and there obtain such alcohol, ardent or vinous spirits, or malt liquors, or any compound or tincture commonly called bitters or tonics, it shall be deemed presumptive evidence of the guilt of the party who owns, controls, or occupies such house or room.

Other acts passed were as follow:

For the better regulation of the system of letting and subletting of lands, and for the punishment of persons for violations of the provisions of this act.

Making the stealing of cattle, hogs, sheep, and goats a felony, and prescribing the punishment.

To provide how railroads shall unite, cross, intersect, or join other railroads.

To prevent the sale of obscene literature.

Requiring compensation for causing death by wrongful act, neglect, or default.

The following article was proposed as an amendment to the Constitution of the State, to be voted upon at the next general election:

ARTICLE XX. The General Assembly shall have no power to levy any tax, or to make any appropriations to pay either the principal or interest, or any part thereof, of any of the following bonds of the State, or the claims, or pretended claims, upon which they may be based, to wit: Bonds issued under an act of the General Assembly of the State of Arkansas, entitled "An act to provide for the funding of the public debt of the State," approved April 6, A. D. 1869, and numbered from 491 to 1,860, inclusive, being the "funding bonds," delivered to F. W. Caper, and sometimes called "Holford bonds," or bonds known as railroad aid bonds, issued under an act of the General Assembly of the State of Arkansas, entitled "An act to aid in the construction of railroads," approved July 21, A. D. 1868, or bonds called "levee bonds," being bonds issued under an act of the General Assembly of the State of Arkansas, entitled "An act providing for the building and repairing the public levees of the State and for other purposes," approved March 16, A. D. 1869; and the supplemental act thereto, approved April 12, 1869; and the act entitled "An act to amend an act entitled 'an Act providing for the building and repairing of the public levees of this State,'" approved March 28, A. D. 1871, and any law providing for any such tax or appropriation shall be null and void.

United States Senator Garland was re-elected.

Finances.—The total amount of warrants drawn by the Auditor for the two years ending September 30, 1882, was \$1,356,392.80, of which sum \$493,382.63 was used in paying the current expenses of the State government for the two years.

During the two years the 10 per cent. bonds of the State, known as the Baxter war bonds, amounting originally to \$280,443.02, were redeemed and canceled.

There is now outstanding only about \$50,000 in State scrip.

On the subject of the State debt, and the condition of the State's finances, Treasurer Woodruff says: "The redemption of the ten-year bonds, and the near absorption of the floating (scrip) debt, place the State in better financial condition than at any time since 1860. . . . Taking as correct the estimate of the bonded debt contained in statement No. 18, the acknowledged debt was, October 1, 1882,

\$5,078,692. Of this amount, \$2,495,500 bears interest at the rate of 6 per cent., and \$22,000 at the rate of 5 per cent. per annum; \$6,200 bears no interest, and will be redeemed before the Legislature meets. The remaining \$2,554,992 is unpaid interest accrued."

In his message to the Legislature at the beginning of the year, the Governor says:

By reference to the reports of the Treasurer and Commissioner of State Lands, it will be seen that both recommend the repeal of the donation or homestead law, and that the forfeited lands, which now amount to over 8,000,000 acres, be reserved, or sold only for the extinguishment of the State debt. This would seem to be a wise provision, and I most heartily concur in its recommendation.

Among the first things, however, to determine is, of what does the just and legal debt consist? The legality and justness of a portion of this debt have been questioned, and much bad feeling has been engendered among the people of the State. Among all classes, however, there is a disposition to act honorably and honestly by the State's creditors. The mass of the people are honest and in favor of honest methods, and the one important point first to determine is, whether common honesty demands payment of any portion of our disputed indebtedness.

Repudiation, in any form or in any shape, can be fraught only with evil. No constitutional enactment can do away with the State's legal responsibility for paper issued by her.

The history of the issuance of \$5,300,000 of bonds to aid in the construction of railroads is well known. The bonds were issued to the roads, taken to New York and other commercial centers, sold, and the proceeds used by the roads to aid in their construction. When this was done, there was a contract between the roads and the State that the latter should be held harmless. These bonds are now in the hands of innocent purchasers. Because the Supreme Court of the State has declared the act under which the bonds were issued illegal, and as the General Assembly, at its extraordinary session in 1874, repealed the act providing for the sequestration of the earnings of the roads, in default of payment of interest, it is contended that the innocent holders of the bonds should receive nothing. So far as the State is concerned she can not be expected, nor is it assumed, by even the bondholders, that she ought to pay any part of this indebtedness. But does she not owe a duty to the innocent purchasers of her bonds, to see that they are protected, and that the roads are compelled to comply with their contract? The State has the power, through the Legislature, undoubted and supreme, to tax the railroads in an amount sufficient to meet the yearly interests and eventually the principal of these bonds; this, irrespective of the unconstitutionality of the law under which they were issued.

Since commencing my message, the Circuit Court of the United States, for this State, has rendered a decision in regard to these railroad aid bonds, sustaining this view of the case, and therefore strengthens this my recommendation.

I desire to again emphasize all that has heretofore been said on the subject of the judgment held by citizens against the State, on account of property taken from them during the pending of martial law in several counties in 1869. Provision for the payment of this debt should be made at once.

Inaugural Views.—Gov. Berry was inaugurated on the 13th of January, and in his address expressed the following views:

The fact that there are outstanding bonds representing some \$18,000,000, which are claimed by the holders to be a valid obligation of the State, and which are believed by a large portion of our people to be fraudulent and void, has proved a constant source

of annoyance and embarrassment. The best interests of the people demand that the question of the State's liability for these bonds be definitely settled. If they constitute a just claim, we ought to provide for their ultimate payment. If they are not a legitimate charge against the State, and we do not intend to pay them, common fairness requires us to say so, and say it in such a manner that we can not be misunderstood. Two classes of these bonds, those known as the railroad aid and levee bonds, amounting to more than \$10,000,000, have been declared by our Supreme Court to have been issued without authority of law, and not binding upon the State. The remaining class, known as the Holford bonds, are based upon a claim which the authorities of the State refused to recognize when first preferred—a claim the people have never admitted to be just, but upon which they have already paid all that, under any view of the circumstances, could be claimed was either legal or equitable. In a matter of this magnitude it seems to me eminently proper that the question should be withdrawn from the General Assembly and placed directly before the people. Under our present system the railroad property practically escapes taxation, the total amount of State taxes upon railroad property upon last year's assessment, excluding lands, being only \$2,400. Some of these railroad corporations claim to be exempt from taxation by their charters. This claim should be thoroughly investigated.

The Governor proposed a new revenue law, "that will compel assessors to assess all of the property of the State at its true value; that will impose upon railroad property its just portion of taxes, levied for the benefit of all; that will prevent tax-dodging," etc.

Railroad Aid Bonds.—The railroad aid bonds were issued by the State under the act of 1868. They were accepted and used by five railroad companies, to which the following issues of bonds were made:

Little Rock and Fort Smith.....	\$1,000,000
Little Rock, Pine Bluff, and New Orleans.....	1,200,000
Mississippi, Ouachita, and Red River.....	600,000
Memphis and Little Rock.....	1,200,000
Arkansas Central.....	1,300,000
Total.....	\$5,300,000

To which sum must be added twelve years' interest at 7 per cent.

The Memphis and Little Rock Railroad Company owns and holds \$988,000 of the \$1,200,000 bonds originally issued to that corporation, and the bonds owned and held by the Little Rock and Fort Smith Railway Company amount to \$644,000. These bonds were purchased years ago upon advice of counsel, at very low figures, with a view of hedging against a possible decision by the courts, holding the railroads and not the State liable for the bonds issued to those corporations. The remainder are outstanding.

Of the railway corporations above named, all but one—the Arkansas Central—are thoroughly responsible, and fully able to liquidate the claims due on these bonds.

In the suit of Tompkins vs. the Little Rock and Fort Smith Railroad Company, in the United States Circuit Court, Judges Caldwell and McCrary held on demurrer that these bonds were a lien on the railroads, but, at the hearing on the merits, Justice Miller held the contrary. Judge Caldwell dissented, and the

case went to the Supreme Court of the United States. These issues of railroad aid bonds form a portion of the alleged public debt of the State, to repudiate which amendment No. 1 was submitted to the electors in 1880, lost by not receiving a constitutional majority, and will be resubmitted at the general election in 1884. The significance of Justice Miller's decision is in holding the railroads harmless, and throwing the bonds back on the State, which issued them under an act in whose passage the State Supreme Court has decided the necessary forms were not complied with.

Miscellaneous.—The Insane Asylum has been completed, and a State Board of Health organized. The building for a branch normal college for the education of colored teachers, near Pine Bluff, has been completed.

In March a joint legislative committee reported the net deficit of Gov. Churchill's accounts, as State Treasurer during three terms, to be \$238,616.89, differing widely from the previous report of a Senate committee, which made the deficit about \$114,000.

ASTRONOMICAL PHENOMENA AND PROGRESS.

Solar Activity.—The year 1883 has been characterized by considerable disturbance of the sun's surface. The "Comptes Rendus," vol. xcvi, No. 4, describes in detail the phenomena observed from the 16th to the 23d of July—a period of very marked activity. At 4 o'clock on the afternoon of the 16th, M. Thollon saw, on the sun's eastern limb, a most brilliant prominence, in which the spectroscope indicated a violent displacement of the C line. At 5^h 20^m this displacement was so pronounced that M. Thollon inferred an approach of solar matter at the rate of 186 miles a second—ten times the velocity of the earth in its orbit. Somewhat earlier in the afternoon a smaller displacement was observed in the opposite direction. On the 21st and 22d, a considerable part of the sun's southern hemisphere gave signs of great agitation. A large group, consisting of spots too numerous to be counted, was seen near the eastern margin, and a long chain of spots, at almost regular intervals, stretched across the disk, from limb to limb. On the morning of the 22d a brilliant prominence attracted attention, and a number of metallic lines were strongly reversed. M. Thollon says he had never, in so short a time, seen so many large displacements of the spectral lines.

Total Eclipse of May 6, 1883.—This eclipse was observed at Caroline Island, in the South Pacific Ocean, by parties from the United States, Paris, and Vienna. The expedition sent by the United States Government was under the direction of Prof. Edward S. Holden, of the Washburn Observatory, at Madison, Wis. Other members of the party were Lieut. Brown, of the Navy; Prof. Hastings, of the Johns Hopkins University; Prof. C. S. Peirce, of the Coast and Geodetic Survey; and Mr. C. H. Rockwell, of Tarrytown, N. Y. It had been

hoped by astronomers that the question of the existence of an intra-Mercurial planet would be definitely settled, as a special search had been arranged for by two parties of observers. The state of the atmosphere was favorable, the duration of totality was unusually long, and Prof. Holden himself swept the region about the sun with all possible attention. His search, however, was entirely unsuccessful. The facts of the case are thus exceedingly perplexing. That fixed stars, whose positions were well known, should have been mistaken for planets by two experienced observers, such as Watson and Swift, seems almost incredible. On the other hand, it is at least equally improbable that Professors Holden and Palisa, with more time for the search, should have failed to detect a planet, if any were visible. During totality, M. Trouvelot noticed a reddish star of the fifth magnitude—not far from the sun—which he has not since been able to identify.

Markings and Spots on Mercury.—"The Monthly Notices of the Royal Astronomical Society" for March, 1883, contains the results of the recent observations of Mercury by Mr. W. F. Denning, of Bristol, Eng., and Sig. Schiaparelli, of Milan, Italy. The former saw several dark, irregular spots on the mornings of Nov. 6, 7, 9, and 10, 1882; also a small bright spot and a large white area. The south horn of the planet was also seen on several mornings to be very much blunted. Both Denning and Schiaparelli find the markings on Mercury much more distinct than those on Venus. They find, moreover, that the former bears a more striking resemblance, in its physical aspect, to Mars than to Venus. Without undertaking to give an exact determination of Mercury's rotation-period, Mr. Denning expresses the opinion, concurred in by Schiaparelli, that Schroeter's period of 24^h 5^m 30^s is too short. The observations of these astronomers give promise that this element, hitherto somewhat doubtful, may soon be accurately found.

The Transit of Venus on Dec. 6, 1882.—The various expeditions sent to different parts of the world to observe the transit of Venus in 1882 were generally successful. At the Naval Observatory, Washington, D. C., Prof. E. Frisby, with the 26-inch equatorial telescope, observed the four contacts as follows:

First contact.....	8h.	56m.	4 ^s .a.
Second contact.....	9	16	9
Third contact.....	2	33	57
Fourth contact.....	2	56	55

Capt. Sampson observed with the 9-inch equatorial telescope as follows:

First contact.....	5h.	55m.	9 ^s .a.
Second contact.....	9	16	18 ^s .96
Third contact.....	2	39	56 ^s .11
Fourth contact.....	Uncertain.		

The observations at Princeton, N. J., were reported by Prof. Young in the "Sidereal Messenger" for January, 1883. All four of the contacts were observed. One hundred and eighty-eight photographs were taken by Prof. Bracket. The spectroscopic observations by

Prof. Young and Mr. McNeill showed unmistakably the presence of water-vapor in the atmosphere of Venus. "Between the first and second contacts the atmosphere of the planet was conspicuous as a delicate halo around its disk."

The transit was observed at Vassar College, Poughkeepsie, N. Y., by Prof. Maria Mitchell; at Harvard College Observatory, by Prof. Pickering and others; at Dearborn Observatory, Chicago, by Professors G. W. Hough and S. W. Burnham; at Allegheny Observatory, Pa., by Prof. S. P. Langley; at Tarrytown, N. Y., by Mr. Charles H. Rockwell; at Columbus, O., by Prof. R. W. McFarland and Mr. F. H. Eldredge; at Phelps, N. Y., by Mr. W. R. Brooks; at Nashville, Tenn., by Prof. E. E. Barnard; at New Windsor, Ill., by Prof. E. L. Larkin; and by many others in various parts of the country. The observations of foreign astronomers were also generally successful. "How long it will be before the observations, especially the photograph and heliometer measures, are fully reduced and published, it is impossible to say. It must be years at least. After this is done, it will be extremely probable that some high authority, perhaps an international commission, should collect and discuss all the various observations, both of this transit and that of 1874, and, from the enormous mass of material thus obtained, deduce the best final result which it can furnish—a result which can not fail to be of the highest value in settling the dimensions of our universe."*

Mr. A. Stanley Williams, who observed the transit at Brighton, Eng., while examining the border of light around Venus, noticed this fringe to be very conspicuous on the southern portion of the planet's limb, but very faint and narrow elsewhere. During the transit, however, some change was manifest in the relative brightness at different parts of the ring. The phenomenon was ascribed by Mr. Williams to the presence of clouds on the limb of Venus.

The Moon.—In "The Observatory" for March and April, 1883, Mr. A. Stanley Williams, of West Brighton, Eng., gives an interesting account of his observations on the lunar crater Plato during the past five years. The condition of our satellite has long been regarded as dead and changeless; but the observations of Mr. Williams, in connection with a most careful examination of the floor of Plato by several astronomers from 1869 to 1871, reveal the fact of undoubted physical changes within the past twelve years. The evidence of variation does not rest on the testimony of a single observer. Observations of Plato were simultaneously conducted by the Rev. J. B. Allison, of Chesterfield; W. F. Denning, of Bristol; T. P. Gray, of Bedford; and H. Pratt, of Brighton. Some of the changes discovered by a comparison of the late observations with those of 1869-'71 are as follow:

1. Of the thirty-seven spots observed and

* "Sidereal Messenger," February, 1883.

mapped about 1870, six have entirely disappeared. Seven new ones have been found, however, during the recent observations.

2. A very large increase in visibility is found in the spots numbered 12 and 18 on the chart of the floor of Plato. The latter also exhibits some remarkable changes in form.

3. No. 16 has to a considerable extent decreased in brightness.

4. Several streaks in the floor of the crater have sensibly increased in breadth; three new streaks have appeared within the past ten years, and several that were distinctly visible about 1870 can not now be found.

5. Very obvious changes in the state of the floor of the crater have taken place since the observations of 1869-'71.

Diameter of the Moon.—Prof. H. M. Paul, of the United States Navy, has lately redetermined the semi-diameter of the moon from two occultations of the Pleiades, observed on July 6, 1877, and September 6, 1879. His value of the mean apparent semi-diameter is 15' 31".78"; corresponding to a diameter of 2158.8 miles.

Minor Planets.—The 232d minor planet was detected on the 21st of January, 1883, by Herr Palisa, of the Vienna Observatory. It is of the twelfth magnitude, and is the thirty-ninth discovered by this observer. The right to select a name was delegated to Dr. Engelhardt, of Dresden, who called it Russia. Its elements, computed by Dr. Herz, from Vienna observations of January 31st, Rome, March 8th, and Dresden, April 18th, are as follow:

Epoch, April 15-5, Berlin mean time.	
Longitude of perihelion.....	200° 24' 37"
Longitude of ascending node.....	152 30 23
Inclination.....	6 8 34
Mean daily motion.....	370.2326"
Period.....	1489.26 days.
Mean distance.....	2.5523
Eccentricity.....	0.1754

The mean distance falls in the cluster immediately exterior to the well-known hiatus where the period of an asteroid would be one third that of Jupiter.

Another asteroid was discovered at Marseilles, on the 11th of May, by M. Borelly. Its light is about equal to that of a star of the eleventh magnitude. The third minor planet of the year was detected, August 12th, by Dr. Peters, of Clinton, N. Y. This is the 234th of the group, and the 42d discovered by him. It is of the ninth magnitude, and its approximate elements are as follows:

Epoch, 1883, August 30-5, Berlin mean time.	
Longitude of perihelion.....	382° 6' 35.5"
Longitude of ascending node.....	144 6 44
Inclination.....	15 31 19
Eccentricity.....	0.2456
Mean daily motion.....	356.674"
Period.....	1854.7 days.
Mean distance.....	2.39605

Owing to the great eccentricity of this planet's orbit, its least distance from the sun is only 1.812. Its remarkable brightness when discovered was due to the fact that it was nearly in opposition, as well as near the sun, at the time of its detection. The 235th minor

planet was discovered on the morning of Nov. 29, 1888, by Dr. Palisa, of Vienna.

Distribution of the Asteroids in Space.—Flammarion's "L'Astronomie" for June, 1888, contains an article of much interest on the distribution of the asteroids between Mars and Jupiter. The author, Gen. Parmentier, notices well-defined gaps in those parts of the zone where the periods would be commensurable with that of Jupiter. His discussion of the periods and distances is thus confirmatory of Prof. Kirkwood's theory, published in 1866.

Several asteroids lately discovered are still without names; the following have been conferred during the current year:

No. 224. Oeana.	No. 230. Athemantis.
" 225. Henrietta.	" 231. Vindobona.
" 226. Weringia.	" 232. Russia.
" 227. Philosophia.	" 234. Barbara.
" 229. Adalinda.	

Jupiter.—The great red spot on Jupiter, which had been observed for several years, gradually disappeared in 1888. Prof. Ricco, of the Royal Observatory, Palermo, says that, in September, the part of the surface recently occupied by it had become brilliantly white. He infers from his own observations that the neighborhood of the red spot had acquired the same rate of motion as the spot itself. This place is designated by a permanent depression in the great belt in which the red spot was situated.

Prof. G. W. Hough, Director of the Dearborn Observatory, Chicago, has for several years made Jupiter a special object of attention. In his last annual report, May 9, 1888, he says: "While the spot has remained nearly stationary in latitude, the south edge of the great Equatorial Belt has gradually drifted south during the present opposition, until it is nearly coincident with the middle of the spot. But what is remarkable, the two do not blend together, but are entirely distinct and separate. A depression has formed in the edge of the belt, corresponding in shape to the oval outline of the spot, the distance between the two objects being about one second of arc. That portion of the belt following the spot first began to drift, forming a bend near the position occupied by a curious offshoot, seen at various times in 1880 and 1881. The non-blending of the two objects would seem to indicate that they are composed of matter having repellent properties, similar to two clouds charged with the same kind of electricity."

It is suggested by Prof. Hough that the red spot visible from 1878 to 1888 may have been a return of the great spot observed by Hook and Cassini from 1664 to 1666. It was some distance south of the equator, and its diameter was over 8,000 miles. It reappeared and vanished eight times within forty-four years from the date of its first discovery. If the objects are the same, "we would naturally infer that it was a portion of the solid body of the planet; being sometimes rendered invisible by a covering of clouds."

"The Observatory" for April contains a communication by N. E. Green, on the relative heights of markings on Jupiter. The white spots, it is maintained, are at a higher level in the atmosphere of the planet than the dark ones. This theory is derived from a critical examination of several hundred drawings of the planet, taken within the past twenty years. The reasons assigned by Mr. Green for the adoption of his views are as follow:

"1. The general form of the light marks, these being round, oval, or compact patches, very unlike openings or rifts in a superficial cloudy envelope. 2. That the oval forms so frequently seen on the equatorial side of the dark southern belt, indent equally both the dark belt and the general surface of the planet. 3. That the continuity of a long, dark streak is occasionally broken by a patch of light broader than the streak, the patch of light hiding, therefore, not only the streak but a portion of the general surface of the planet to the north and south of it. The first reason, that of the general form of the light markings, may seem to be weak, but, taken in connection with their relative position, is by no means inconclusive. In March, 1874, lines of small round patches of light, smaller than the satellites, were frequently seen, looking like strings of pearls; these occurred generally on the dark southern belt, but were occasionally seen in northern and high southern latitudes. Now, if the darker portions are uppermost, these surfaces must have been pierced like the sides of a man-of-war, in order that the light underlying portion might be seen through the openings. Again, in January, 1873, large oval masses of light were so constant on the equatorial side of the southern belt, that the belt itself looked like a long, dark bridge with many arches; but let it be observed that these light forms not only indented the dark belt on one side, but equally indented the general tone of the planet on the other; and if we consider the dark belt as being at a higher level, and the light marks as portions of a continuous light surface seen through its openings, we must admit that some other envelope is also pierced with similar openings, and that the two openings coincide, in order that the oval form may be complete—a supposition which is not recommended by its probability. But the last argument, that of the imposition of a mass of light on a long, dark streak, is the most conclusive; this has occurred several times since the last opposition, the most marked instances being on Feb. 18, at 8^h 55^m G. M. T., and Feb. 24, at 8^h 45^m. On the first date a broad and somewhat square patch of light interrupted the continuity of the darkest portion of the southern belt, and, being broader than the belt, extended in the direction of the equator over the general tone of the planet. On Feb. 24th, 8^h 45^m—a square patch of light was nearly on the center of the disk; this lay on a long, bluish streak. The patch of light was consider-

ably broader than the streak, and, what is very remarkable, portions of blue streak appeared on the north and south sides of the square patch, as though the light patch had been formed from material drawn away from the general covering of the surface, thus leaving vacant spaces both above and below it."

In "The Observatory" for April, 1888, W. F. Denning gives some results of his own observations of Jupiter's equatorial white spot, and also of the great red spot now no longer visible. Mr. Denning has found that while the white spot was completing 2,064 revolutions, the red spot performed only 2,045; in other words, the white spot gained 19 revolutions. The former, therefore, moves 260 miles an hour more rapidly in a direction from west to east around the planet. The average period of the red spot from July, 1881, to March, 1893, was $9^h 55^m 37^s$; that of the white spot, $9^h 50^m 8^s$. These results are very nearly identical with those found by Prof. Hough.

Researches on the Saturnian System.—During the past three years Dr. Wilhelm Meyer, of Geneva, has been engaged in an elaborate investigation of the Saturnian system.* His observations of 1881 give the following:

Dimensions of Saturn and its rings for the distance..	9° 58' 39"
Exterior diameter of the bright ring.....	40° 35"
Diameter of the ring in the middle of Cassini's division.....	34° 43'
Interior diameter of the bright ring.....	38° 05'
Interior diameter of the dusky ring.....	21° 18'
Distance between the extremity of the ring and the planet on the west.....	11° 84'
The same distance on the east.....	11° 30'
Equatorial diameter of the planet.....	17° 77'
Polar diameter of the planet.....	16° 19'
Compression.....	1/37

The interior edge of the bright ring was not sharply defined, and hence the interior diameter could not be determined with accuracy.

Orbits of the Satellites and Mass of the Primary.—Dr. Meyer's observations of Mimas and Hyperion were insufficient for a determination of their orbits. The others were satisfactorily observed, and the resulting distances and periods are given below:

SATELLITES.	Mean distance.	Period.			
		d.	h.	m.	s.
Enceladus.....	34° 3501	1	8	58	6.99
Tethys.....	43° 7514	1	21	18	25.63
Dione.....	54° 7574	2	17	41	9.29
Rhea.....	76° 4833	4	18	25	11.57
Titan.....	176° 9103	15	92	41	23.16
Iapetus.....	514° 7108	79	7	49	24.84

The mass of Saturn obtained from these periods is $\frac{1}{753}$, a value somewhat greater than that found by Beasel. The mass of the ring, that of Saturn being 1, is $\frac{1}{17}$.

The Divisions in the Ring.—The London "Observatory" for September, 1883, gives the following abstract of Dr. Meyer's researches on the divisions of Saturn's ring, and the disturbing influence of the satellites:

"Prof. Kirkwood showed, some twenty years ago, that Jupiter exercised a peculiar influence

over the minor planets, tending to produce well-marked gaps among them at certain well-defined distances. For if the period of any minor planet were commensurable with that of Jupiter, the latter would exercise a perturbing influence upon it, which would eventually result in a complete change of orbit. Later on, in 1868, Prof. Kirkwood employed the same principle to account for the great division (Cassini's) in Saturn's rings. Maxwell had shown that the rings must be formed of separate particles moving round the planet to a certain extent as independent satellites. But a body moving round Saturn at the distance of Cassini's division would have a period that was very closely commensurable with those of each of the six inner satellites, and it would, therefore, be especially exposed to perturbation. Dr. Meyer has carried the principle yet further, and has investigated every possible combination of the commensurabilities of the revolution periods of the satellites, and he finds that, including the division of Cassini, there are seven places where the satellites would unite to exercise a perturbing influence on the members of the ring system. The first position is where the period would be one fourth of that of Mimas, and marks the inner boundary of the dark ring. Particles moving at almost precisely the same distances would have their times commensurable with each of the other five inner satellites: thus, for a period of one fourth of that of Mimas, we have a distance of $10^{\circ} 56''$ from the center of Saturn; for one sixth of that of Enceladus, $10^{\circ} 43''$, and for one eighth of that of Tethys, $10^{\circ} 66''$. Dr. Meyer sees a consequence of this close agreement in the well-defined character of the inner edge of the dark ring. Next comes Struve's division in the dark ring. One fifth the period of Enceladus corresponds to a distance of $11^{\circ} 79''$, one seventh that of Tethys, $11^{\circ} 66''$; the next three satellites give a closely similar result. The position of Struve's division is not very exactly known, and Dr. Meyer adopts $11^{\circ} 79''$ as its distance, being the mean between the positions of the inner boundaries of rings C and B. One third of the period of Mimas introduces a new series of commensurabilities in which all the six satellites take part, but the agreement is by no means so close as in the first two cases; and Dr. Meyer regards the indistinct character of the inner boundary of the bright ring B, which would about correspond to the mean of the distances indicated, as connected with this less perfect coincidence. The period of Enceladus is four times, that of Tethys six times, that belonging to a particle at this distance. Cassini's division corresponds, as already stated, to a period commensurable with each of the six inner satellites, the period of Mimas being twice as long, Enceladus three times, Tethys four, Dione six, Rhea nine, Titan thirty-three. The commensurabilities in the case of the four nearest satellites are of the simplest possible character; and we find

* Astr. Nach., Nos. 2517, 2527; London Obs., July and September, 1883; Payne's Std. Mess., September, 1883.

that the inner edge of Cassini's division, which is situated at the distance thus indicated, is especially distinctly marked. The outer edge is very indistinct, the influence of Rhea and Titan being much feebler, on account of their great distance.

"One fifth the period of Dione corresponds to about the distance of Encke's division. One eighth of Rhea's period and one half of Titan's approximate roughly to the same distance. The division is faint and ill-defined. One third the period of Tethys, the simplest relation now remaining, indicates the outer boundary of the ring system, and one seventh that of Rhea, and one twenty-sixth that of Titan, correspond to distances of nearly the same amount.

"The only simple relation omitted is that of one fifth the period of Tethys, and this closely corresponds to integral parts of the periods of the three next outer planets. There should, therefore, be another division at about $14\cdot7''$. Dr. Meyer does not seem aware of the fact; but several observers of Saturn have noticed that ring B begins to shade off a little nearer Saturn than the center of the ring, which would correspond to a distance of about $14\cdot7''$ or $14\cdot8''$. Prof. Holden speaks of the point where this shading off begins as 'a definite point.' The correspondence between calculation and observation as to the divisions of Saturn's rings would, therefore, seem to be complete."

At a meeting of the Philosophical Society of Washington, Oct. 13, 1883, William B. Taylor recalled attention to M. Struve's conclusion, announced in 1851, that the rings of Saturn are increasing in breadth, while the interval between the inner bright ring and the planet is gradually decreasing. This conclusion, according to Mr. Taylor, is confirmed by later observations; although the change is probably less rapid than was inferred by Struve, from a comparison of the measures up to 1850. This process of convergence, it was shown, is a necessary consequence of the modern discovery that the rings consist of dense streams of indefinitely small satellites. All parts of the ring are subject to perturbations by the exterior members of the Saturnian system. The bodies composing the ring can not, therefore, revolve in circular orbits. Hence the friction or collision of the different parts must frequently occur, resulting in a "degradation of motion," a convergence of orbits, and a shortening of the periods. In this theory of their constitution Mr. Taylor foresees the ultimate precipitation of the rings upon the surface of the planet.

Uranus.—The question whether Uranus has any measurable ellipticity seems to have been definitely settled by the recent observations of Profs. Safarik, of Prague; Schiaparelli, of Milan; and Young, of Princeton. The polar compression, according to these astronomers, is about $\frac{1}{11}$. This is greater than that of Jupiter, and nearly equal to that of Saturn—a fact indicative of a rapid rotation. Prof. Young

has also observed certain spots or markings on the surface of the planet, similar to those on Jupiter and Saturn, by the continued examination of which the rotation period may possibly be determined.

Comets.—On the evening of February 28, 1883, a comet was discovered by W. R. Brooks, of Red House Observatory, Phelps, N. Y. The same body was independently detected only a few minutes later on the same evening by Dr. Swift, of the Warner Observatory, Rochester. About the first of March the comet was described as nearly round, and with a very condensed nucleus. According to some observers, it had a granular appearance, somewhat resembling a resolvable nebula. It had a faint tail, about $18'$ in length. From observations made at Cambridge, Mass., on February 24th, March 5th, and March 17th, and one at Albany, N. Y., on March 5th, Messrs. Chandler and Wendell, of Cambridge, computed the following elements:

Perihelion passage =	1883, Feb. 18-1887, G. M. T.
Longitude of perihelion	29° 00' 00"
Longitude of ascending node	273 7 41
Inclination	78 4 40
Perihelion distance	0·7599

On the night of September 1st, W. R. Brooks observed a small object, which he at once suspected to be a comet. Cloudy weather prevented satisfactory observations till the night of the 8d, when his suspicions were fully confirmed. The comet was circular, more than a minute in diameter, had a well-defined star-like nucleus, and was without a tail. From about two weeks' observations at the Dudley Observatory, Albany, N. Y., Prof. Lewis Boss found the elements of the comet's orbit so nearly coincident with those of the comet discovered by Pons on the 20th of July, 1812, as to leave no doubt of their identity. This fact was announced on the evening of September 19th. The sameness of the two bodies, however, had been independently shown one day earlier by the Rev. George M. Searle, of New York. Mr. Searle's conclusion—reached by a method different from that employed by Prof. Boss—was at once forwarded to Harvard College, where it was received on the morning of September 20th. Marked changes of structure in approaching the sun were observed within three weeks from the date of its discovery. Indications of a nucleus were seen at Harvard on the night of September 21st. The next night its appearance was greatly changed; the brightness being nearly equal to that of an eighth-magnitude star. On the night of the 23d it had lost its stellar aspect, had become blurred, had a rather distinct nucleus, and was beginning to develop traces of a tail. The perihelion passage will occur about 1884, January 25th.

Attention has been called to the fact that the elements of this comet strikingly resemble those of De Vico's comet of 1846, with the exception that the ascending node of the one coincides with the descending node of the other. This close coincidence of orbits has been thought to indicate a common origin.

Periodicity of Comets.—At the session of the Paris Academy of Sciences on January 8, 1883, M. Zenger read a paper on the periodicity of comets. The theory proposed includes the following propositions:

1. Comets have originated in the sun.
2. Their origin has been in some way connected with the sun's rotation.
3. Portions of the matter forming the solar protuberances have been thrown out into space by enormous explosive force. From the matter thus ejected large meteorites might gather about them such quantities of the coronal substance as to constitute comets.
4. The periods of comets are multiples of half the rotation period of the sun.

M. Zenger has collected a number of facts which he regards as evidence in favor of his hypothesis.

The Great Comet of 1882, and the Spectroscopic Method of determining Motions in the Line of Sight.

—This comet afforded an excellent opportunity for testing the accuracy of the spectroscopic method of finding the rate of approach or recession of the heavenly bodies. M. Thollon, observing the comet's spectrum on September 18th, found the bright lines of sodium displaced by an amount indicating a recession at the rate of forty-seven miles a second. After the comet had been observed for a sufficient length of time to determine its orbit, its true rate of motion in the line of sight was found to have been forty-five miles a second. As the amount of displacement was only estimated by M. Thollon, not accurately measured, the agreement between the observed and calculated rates is quite satisfactory. The comet's rate of recession, September 18, 1882, was about equal to that of Vega as determined by the spectroscope.

Meteors.—The following large meteors were observed during the year ending December 1, 1883:

On December 12, 1882, a large meteor was seen from the United States steamer *Alaska*, westward from San Francisco, latitude $88^{\circ} 21'$, longitude $134^{\circ} 7'$ west; when about 10° above the horizon it exploded with a loud detonation, the glowing fragments plunging into the ocean.

At Concord, N. H., one of the largest and most brilliant meteors ever observed there was seen on the afternoon of December 20, 1882, between four and five o'clock. It passed from west to east, and was as plainly visible as meteors usually are after dark.

Payne's "Sidereal Messenger" for March, 1883, contains an account of a very brilliant meteor which passed over Central Indiana on the evening of January 8d. From observations at numerous points in Indiana and Illinois it is concluded that the meteor first became visible over Grant county, Indiana, at a height of about 85 miles, that it passed very nearly over Kokomo and Lafayette, its height at the latter place being 58 miles; that its course was south

78° west, and that the length of its visible track was about 140 miles.

About six o'clock on the evening of February 5th a meteor three or four times as large as Venus was seen at several points in Indiana. At Bloomington, when first noticed, it was a few degrees east of south, 18° or 20° above the horizon. It disappeared behind a building, the length of its visible track having been nearly 20° . At Martinsville, Morgan county, it was first seen 5° west of south at an apparent elevation of 18° .

On the 16th of February a large meteoric stone fell, a little before three o'clock in the afternoon, between Oremona and Brescia, sinking more than three feet into the earth. The explosion was heard at a distance of 12 or 18 miles.

At Norwich, Conn., a meteor of great magnitude was seen on the evening of February 27th. Its path was from the northeast to the northwest.

Early on the morning of March 4th an immense fire-ball darted across the heavens at Petersburg, Va., brilliantly illuminating the city. Its course was northwest, and an explosion was heard shortly after its passage.

At the meeting of the Royal Academy of Vienna, on the 14th of June, 1883, Prof. G. von Niessl read an elaborate discussion of the observations of a meteoric fire-ball seen at Brünn and elsewhere, at about $7^{\text{h}} 30^{\text{m}}$ on the evening of March 18, 1883. Dr. von Niessl finds the radiant point of this meteor to have been in right ascension $148^{\circ} 30'$ and in south declination 9° . Its mean altitude was about 61 English miles, and its heliocentric velocity was estimated at 50 miles a second. The meteor's orbit about the sun was, therefore, an hyperbola. If it belong, then, to a meteoric cluster, no member of the group can be expected to return. Several other large meteors are known to have appeared at nearly the same epoch.

On the evening of April 14th, at $7^{\text{h}} 30^{\text{m}}$ a remarkably fine meteor was seen at Wooster, O. When first noticed, its direction from its point of observation was east-southeast, about 45° above the horizon. It had at least twice the apparent magnitude of Venus, and the line of its motion would have cut the horizon a little north of east. After a brief visible flight as a single body, it suddenly burst into fragments—twenty or more—all brilliant and pursuing the same direction, but more slowly, and falling somewhat below the line which the meteor seemed at first to pursue.

At about $10^{\text{h}} 45^{\text{m}}$ on the evening of June 8d, a meteor whose apparent magnitude was several times that of Venus was seen at several points in England. At Ripon its length of path while visible was about 120° , with the middle point due east; direction of motion, parallel to the horizon; elevation, 20° ; length of train, 25° . Another large meteor was seen later in the same evening.

A splendid meteor was seen in the evening

twilight, in England, on the 6th of July, at 8^h 50^m. Its course was from northeast to east, at an altitude of 27° when first seen, and 22° when it disappeared. Its motion was slow; the duration of visibility being six or seven seconds. When first seen, its form was globular, but in a second or two it became elongated as though the change were produced by the resistance of the atmosphere. Its color was at first a deep red, afterward a golden hue, and just before disappearance, a brilliant white.

A meteor of intense brilliance was seen at many points in New Zealand at 4^h 46^m P. M., on July 12th. At Ohinitahi it was seen moving slowly from the west in an easterly direction, at an altitude of about 45°. Its appearance was in broad daylight.

A meteoric fire-ball was seen in England at 8^h 25^m on the evening of August 11th. It moved easterly, and its color was a deep amethyst.

A beautiful meteor, considerably brighter than Venus, was seen in different parts of England about ten o'clock on the evening of August 19th. As seen near London by A. J. Mott, "it passed along the eastern sky and vanished over the summit of the Little Orme. The path was northward, nearly horizontal, apparently much foreshortened, for the motion was very slow—not faster than that of balls falling from a rocket; white light, slightly tinged with blue. The meteor divided, and left one large and several smaller portions behind it, all vanishing together." According to Mr. Mott, the meteor did not reach the earth, but after skimming through the upper atmosphere at an altitude of about seventy miles passed onward in its orbit.

A splendid meteor was seen near London, Eng., about nine o'clock on the evening of October 6th. It passed from the northeast, beneath the pole-star, to the west, where it vanished instantaneously without bursting. The nucleus measured at least five minutes of arc in breadth, and was extremely brilliant.

Meteoric Showers.—So far as reported, no meteoric showers of any considerable note occurred during 1883. The numbers seen were small both in January and April; while the showers of August and November almost totally failed. At Great Badow, Eng., H. Corder kept watch on the nights of the 9th, 10th, and 11th of August, with the following results: On the 9th, in two hours and forty-five minutes, 61 Perseids were counted, or 22 an hour. On the 10th, 118 were seen in two hours. On the 11th he watched the whole night, counting 157 Perseids in five hours; the highest number in an hour being 43. The radiant was in 46° R. A., and 56° N. declination.

Telescopic Meteors.—In March, 1883, W. F. Denning, of Bristol, Eng., observed a number of telescopic meteors of the eighth or ninth magnitude. These, as well as those seen during former observations, were generally remark-

able for the slowness of their motion—a fact probably due to their distance.

Double Stars.—In the "Sidereal Messenger" for November, 1883, S. W. Burnham has discussed the observations, by himself and others, of the double star Delta Equulei. The principal star of this wide pair is itself an excessively close binary system, the components of which are very nearly equal. Mr. Burnham finds the probable period a little less than eleven years—much shorter than that of any other binary star now known—shorter even than the period of Jupiter. Mr. Burnham remarks that "by reason of the rapid orbital motion of this close pair, and its movement through space, this is undoubtedly the most important and interesting of all the sidereal systems which have been investigated."

On the evening of October 5th, Prof. C. A. Young, of Princeton, discovered the duplicity of a star in right ascension 16^h 29^m 26^s·3, declination N. 58° 00' 49·9". The components are of magnitudes 8 and 9½.

The last report of the Astronomer Royal, W. H. M. Christie, contains some interesting results derived from a discussion of the observations of Sirius from 1877 to 1883. A few years since, the spectroscope indicated a rapid recession of this star in the line of sight. A comparison of observations, however, has led to the conclusion that its rate of departure has progressively diminished during the past six years, and that the motion is now on the point of being converted into one of approach—a fact which seems incapable of any explanation except on the theory of orbital motion.

Parallax of Certain Stars.—Prof. Asaph Hall, Director of the Naval Observatory, Washington, D. C., has recently completed a series of observations for determining the annual parallax, and hence the distance, of Alpha Lyrae and 61 Cygni. In his reduction of these observations, Dr. Hall was assisted by Prof. Edgar Frisby. The resulting value of the parallax of the former star is 0·1797", corresponding to a distance more than a million times greater than that of the sun from the earth. The parallax of 61 Cygni was found to be 0·4783", and hence its distance is about 880,000 times that of the sun. This value is very nearly identical with that deduced from a series of Dunsink observations extending over a much longer period. The probable error is small in each determination.

At the session of the Astronomical Congress in Vienna, September 14–16, 1883, Dr. Elkin reported the result of some parallax determinations at the Cape of Good Hope by Mr. Gill and himself; particularly of Sirius and Alpha Centauri. The observers found the annual parallax of the former four tenths of a second, and that of the latter three fourths.

Mean Parallax of Stars of the First Magnitude.—Dr. Gylden, of Stockholm, has been lately engaged in a series of observations for finding the annual parallax of the brightest stars. The reduction has not yet been completed, but Dr.

Gylden has reached the conclusion that the mean parallax of stars of the first magnitude is about one tenth of a second. With this result, the average distance of these bodies would be two million times greater than that of the sun—a distance requiring more than thirty-one years for the transmission of their light to the earth.

Distribution of the Variable Stars.—In the "Observatory" for June, 1883, T. E. Espin, Vice-President of the Liverpool Astronomical Society, concludes his interesting paper on the distribution of the variable stars. (See "Annual Cyclopædia" for 1882.) The shortest period in his second class of variables is 135 days; the longest, 570. The variation in brightness is from one to nine magnitudes. The number of stars in relation to different periods is as follows:

Period in days.	Stars.	Period in days.	Stars.
135-170.....	7	320-370.....	21
170-220.....	9	370-420.....	15
220-270.....	10	420-470.....	7
270-320.....	15	470-520.....	8

And the number of stars in relation to the variation in magnitude is—

Var. mag.	Stars.	Var. mag.	Stars.
1.....	3	5.....	27
2.....	8	6.....	25
3.....	6	7.....	6
4.....	14	8 and 9.....	8

From his examination of these tables Mr. Espin infers:

1. That the number of stars increases with the length of the period.
2. That the number of stars increases with the variation in magnitude.
3. That more than two thirds of the variable stars of class second vary more than four and less than six and a half magnitudes; and,
4. That nearly two thirds of the variable stars of class second have periods between 320 and 420 days.

Mr. Espin concludes as follows: "When, nearly eighteen months ago, I commenced the first of these papers, I believed that all cases of stellar variation might, with the exception of temporary stars, be included in classes first and second. Lately, however, I have become aware of the existence of a new class—stars which have a small fluctuation in magnitude once in several years. The observations of 63 Cygni first led me to this conclusion, and some of the stars suspected of variation now under observation go far to confirm it. For the greater part of the time the light of these stars is constant, but then it alters a magnitude or so; but, after a month or two, it returns to its ordinary magnitude. Many of the stars suspected of variation undoubtedly belong to this class third, and it is obvious that only long and careful determinations of magnitude during many years can determine the periods and variation of such stars.

"Summing up our results, then, we find four classes of variable stars:

"Class I. With short periods and small variation.

"Class II. Long period and great variation.

"Class III. Period of several years and small variation.

"Class IV. Temporary stars."

The "Monthly Notices of the Royal Astronomical Society" for March, 1883, contains a note by the Rev. T. E. Espin, of Birkenhead, Eng., on the variability of Beta Cygni and 63 Cygni. The former is placed in the table of *suspected* variables in "Chambers's Astronomy," and this suspicion has been confirmed by Mr. Espin. The change in brightness is not great—about one magnitude—while the period, though not well ascertained, is undoubtedly several years. The period of 63 Cygni is about five years, and the observed variation is from the sixth to the 4.7 magnitude.

Dr. Peters's Star-Charts.—Dr. C. H. F. Peters, of Hamilton College, N. Y., has recently published the first installment of a very elaborate series of star-charts. They are to contain all stars down to the 14th magnitude, as far as 30 degrees on each side of the equator, throughout the whole of the twenty-four hours. Dr. Peters has himself done all of the observing as well as the draughting, and the charts are published at his own expense, for gratuitous distribution. The construction of these charts has occupied his time and attention for the past twenty years. In his laborious observations, he not only carefully marked the place of every one of the 60,000 stars or more already mapped, but, after receiving the proof, he again compared the positions with the actual condition of the heavens, so as to insure the utmost possible accuracy. It has been while engaged in this work that Dr. Peters has picked up so great a number of small planets; these interesting discoveries being merely incidents connected with his systematic observations for another and, perhaps, more important purpose.

Recent Papers on Astronomy.—The following astronomical papers were read at the Minneapolis meeting of the American Association for the Advancement of Science, August, 1883:

1. The Total Solar Eclipse of May 6, 1883; by Prof. E. S. Holden.
2. Internal Contacts in Transits of Inferior Planets; by Prof. J. R. Eastman.
3. Physical Phenomena on the Planet Jupiter; by Prof. G. W. Hough.
4. Observations of the Total Solar Eclipse of May 6, 1883; by Dr. J. Janssen.
5. Orbit of the Great Comet of 1882; by Prof. Edgar Frisby.
6. Some Observations on Uranus; by Prof. C. A. Young.
7. Observations on the Transit of Venus made at Columbia College, New York city; by Mr. J. K. Reese.

Astronomical Prizes.—At the annual meeting of the Royal Astronomical Society, Feb. 9, 1883, the society's gold medal was awarded to Dr. B. A. Gould, Director of the Observatory at Córdoba, South America. "The work for

which the medal was chiefly awarded may be considered as an extension of Argelander's scale of magnitudes to all the stars which can be seen by a good eye, without instrumental aid, between 10° north declination and the south pole, together with a series of charts exhibiting, on a stereographic projection, the positions of all these stars to the sixth magnitude, and a proposed revision of the boundaries of the southern constellations."

On presenting the medal, the president of the society, E. J. Stone, F. R. S., delivered an address in which the labors of Dr. Gould were briefly reviewed, and concluding as follows: "The 'Uranometria Argentina' is a work of very considerable extent; it has been planned with great care, and executed with the most scrupulous attention to details. It will remain an enduring record of the relative brightness of the southern stars for its epoch; and will be accepted for many years as the chief authority upon questions of their magnitude."

The "Comptes Rendus," vol. xcvi, No. 14, announced that the French Academy of Sciences had awarded the Lalande prize to M. Souillart, Professor in the Faculty of Sciences in Lille, for his investigations into the theory of Jupiter's satellites. A prize of 2,000 francs was given to Dr. W. Schur for his determination of the mass of Jupiter, and of the eccentricities of the orbits of the first and second satellites. The first Valz prize was awarded to Dr. Huggins, of England, chiefly for his spectroscopic determination of the motions of stars in the line of sight. The second Valz prize was given to M. Cruls, director of the observatory at Rio Janeiro.

Lick Observatory.—The dome for the 12-inch equatorial telescope of the Lick Observatory, as well as buildings for the transit and the photo-heliograph, was finished some months since. The instruments have been mounted, and are said to be in excellent working order. The walls of the main building are approaching completion, and arrangements are in progress for the reception of the great 36-inch equatorial. The house for the meridian circle has been begun, and a residence for the director and his assistants will be provided as soon as practicable.

Potsdam Observatory.—Prof. H. C. Vogel, Director of the Astrophysical Observatory of Potsdam, has undertaken the preparation of a complete spectroscopic star-catalogue. The examination of the zone extending from 1° south declination to 20° north has been completed, and the second zone, from 20° to 40° north declination, will soon follow. "To prepare such a catalogue," says Vogel, "is a duty which the present generation owes to posterity. The changes taking place in the stars are of special interest to us, and are of importance to science; and although it may be conjectured that changes in the spectra will show themselves soonest in those stars which have proceeded further in their development, that is,

in the red stars, yet this can not be positively affirmed *a priori*. Equally with those wonderful spectra of the red stars, which so enchant the eye of the observer, will changes take place in the course of time in the simple spectra of the white and yellow stars, so that investigations of as large a number of star-spectra as possible, without limiting them to particular classes of stars, are absolutely necessary for future researches."

The Annual Report of the Council of the Royal Astronomical Society of London, read February 9, 1883, contains an account of the proceedings of the British observatories, public and private, for the past year. Most of the results, however, have been already given. At the Royal Observatory, Greenwich, arrangements have been made with the committee on solar physics by which the gaps in the Greenwich series of sun-pictures may be filled up by photographs taken in India, thus rendering the series almost perfectly continuous. The Oxford University Observatory has been chiefly directed to the photometry of the brighter stars of the northern hemisphere. At Mr. Huggins's observatory, Upper Tulse Hill, the director has obtained photographs of the sun's corona without an eclipse. "In the longer exposed plates," Dr. Huggins remarks, "the outer corona with its rays of varying length and peculiar rifts is seen; in the plates with a shorter exposure the inner corona, which is more nearly uniform in height, may be seen under suitable illumination. The average heights of the outer and inner coronæ agree closely with the coronæ as seen on the plates taken in Egypt," during the total eclipse of May 16, 1882.

AURORA BOREALIS. The phenomena of the aurora borealis have recently been made the object of several special studies. They have long been regarded as of electrical origin, but nothing was known of the source of the electric currents that produced them, or of the manner of action under which the different kinds of auroral phenomena were manifested. M. de la Rive, a physicist of Geneva, set forth the hypothesis, about 1850, that the earth is charged with positive, and the upper strata of the atmosphere with negative electricity, and that two currents, very strong in the tropical regions, are constantly proceeding toward the polar regions, where they meet through the medium of an air containing infinitesimal vesicles of water and crystals of snow and ice, and consequently having higher conducting powers. He constructed an apparatus by the aid of which, establishing conditions similar to those he regarded as fundamental to his theory, he produced, on a minute scale, luminous phenomena comparable in appearance to those of the aurora.

Mr. Nordenskjöld, the Swedish explorer, when wintering near Bering Strait, in 1878, observed on perfectly favorable nights a faint luminous arc having its culminating point in

the north-northeast. His studies of this phenomenon led him to the conclusion that the earth is provided with a permanent luminous corona, about 400 kilometres from the surface, having its center correspondent with the magnetic pole, and its plane perpendicular to the terrestrial radius at that point. Its light is so feeble that the slightest rival luminous manifestation—the light of the moon, for example, or the presence of moisture or frost in the air—is sufficient to extinguish it. Hence it is not likely to be visible in inhabited lands, and can be seen, even in the polar regions, only in such favorable seasons as the one he enjoyed, which was a season of *minimum* of auroras, and then only rarely.

Prof. Lenström's Experiments in Lapland.—Direct and definite experiments to ascertain the cause of the auroral displays have been made by Prof. Selin Lenström, of the Finnish Meteorological Station at Sodankylä, Lapland. They were directed especially to the variety of the manifestations which takes the form of tiny flames or a phosphorescent luminosity appearing around projecting objects, such as mountain cones and ridges. Prof. Lenström's first experiments were made in 1871, when, with an apparatus similar to the enlarged one with which he produced the same results on a grander scale in 1882, he succeeded in artificially inducing an aurora on the top of the Luosmavaara mountain, 520 feet above the surface of Lake Enare, in Lapland. Toward the end of November, 1882, Prof. Lenström laid out on the summit of Mount Oratunturi (lat. $67^{\circ} 21'$, long. $27^{\circ} 17' 32''$), about 540 metres above the level of the sea and twelve miles from the observatory at Sodankylä, an instrument which he called an "utströmnings" or "discharging" apparatus. It consisted of a bare copper wire two millimetres in diameter, fitted at every half-metre with points or nibs soldered upon it. The wire was laid out in entwined squares, or in the form of a rectangular helix, in such a way that each inner coil was about a metre and a half from the outer one, and was raised on poles $2\frac{1}{2}$ metres high; and the whole apparatus covered a superficial area of 900 square metres. From the inner end of this wire, an insulated copper wire on poles, with telegraph insulators, led to the foot of the mountain, where a connection was made at the station with a galvanometer, whence another wire led to a zinc disk in the earth. From the day the apparatus was finished, a yellowish-white luminosity appeared almost every night around the summit of the mountain, while nothing of the kind was seen around any of the other mountains. When tested with the spectroscope, the light gave a faintly continuous spectrum from D to F, in which the auroral line

$\lambda = 5,569$ was observed, with soft variable intensity. The galvanometer gave the deflections, extremely variable in intensity, but never ceasing, of a positive current from the "utströmnings" apparatus to the earth. On another mountain, Pietarintunturi (lat. $68^{\circ} 32' 5''$, long. $27^{\circ} 17' 32''$), 950 metres above the sea, a smaller utströmnings apparatus was erected in two parts, so arranged that the inner one covered about 80 square metres, and the outer one 320 square metres. On the 29th of December a single column of aurora, 120 metres in height, appeared above the apparatus. The current, as shown by the galvanometer, was found in the case of this mountain to be "proportionate to the surface-area laid out"; and observations of comparison between the two mountains led to the conclusion that "the electric current from the atmosphere increases

PROFESSOR LENSTRÖM'S UTSTRÖMNINGS APPARATUS. THE COIL OF WIRES.—The insulators are indicated by the letter *i*. The open end of the wire is shown at *o*, while the inner end is connected with the galvanometer.

rapidly with the latitude." Other researches led to the inference that, while the condition of the ground is of some influence, the terrestrial current ceases at a certain latitude. Simultaneous measurements of the angles of elevation were made, at Sodankylä, and at a station four and a half kilometres north of that place, for the purpose of determining the height of the aurora. The measurements made the angle at the southern station three degrees larger than that at the northern one, a result inconsistent with the supposition that the difference in angle represented a parallax of a single object seen from two places; for in that case the larger angle would have been observed at the northern station, and the difference would have been slight. Prof. Lenström came to the conclusion that the two observers did not see the same aurora; and comparing this observation with others, that "measurements of the height of the aurora calculated on those

with a long base north and south, are always erroneous, as the two observers never see the same aurora." Occasionally the characteristic auroral line was revealed in the spectroscope when no aurora was visible to the eye; and the phosphorescent "shine," or diffused luminosity, was observed so regularly as to induce the conclusion that that manifestation is a nearly constant accompaniment of the winter nights of Northern Lapland, and is of auroral origin. From his observations as a whole, Prof. Lenström has drawn the conclusion that "the experiments at Luosmavaara in 1871 and at Oratunturi and Pietarintunturi in 1882 clearly and undeniably prove that the aurora borealis is an electric phenomenon,"; and also prove "that aurora borealis may be produced in nature by a simple contrivance assisting the electric current flowing from the atmosphere to the earth."

Dr. Tromholt's Observations in Finnmarken.—Dr. Sophus Tromholt, of Norway, spent the winter of 1882-'83 at Kautokeino, in North Finnmarken (latitude 69° north, longitude 28° east), making observations in connection with the Norwegian station at Bossekop, about one degree north, and the much more distant Finnish station at Sodankylä, southeast of his post, for the purpose of obtaining the parallax of the aurora. The station is peculiarly favorable, for it is in a zone where the auroral displays attain their maxima, and are nearly constant. He made several attempts to photograph the phenomena, but without success, even the most sensitive English dry plates failing to give a trace of a negative. This he believes to be because of the exceedingly limited substance of light possessed by the glow; a flood of which, illuminating the whole heavens, would not altogether possess a lighting power equal to that of the moon when full. He has confidence in the practicability of his plan for measuring the height of the arc, and estimates it at 150 kilometres; and he believes that its plane is to be found far above that of the clouds. Prof. Lenström, while he admits that the height is variable, is of the opinion that it has been greatly overestimated. Dr. Tromholt expected to spend the winter of 1883-'84 in Northern Iceland, experimenting with Prof. Lenström's "utströmnings" apparatus.

AUSTRALIA AND POLYNESIA. Consolidation.—The movement for the consolidation of the Australasian colonies into a federal union, on the lines of the confederation of British North America, is gaining ground in Australia, and receives the strongest encouragement from the present Government of Great Britain. The tendency toward union became apparent in 1883 in different acts of co-operation and manifestations of a sense of common interests. A second conference to discuss the question to what extent confederation is practicable at the present time met at Sydney in November. The legislatures of the different colonies were represented by delegates selected from their

number. The conference was appointed at the suggestion of the Victorian Parliament and Government. It arrived at no practical conclusions on the main question. The question of the annexation of the Melanesian Islands gives a new import to the movement. All the colonies of Australia, through resolutions of their legislatures during the year, called upon the Imperial Government to occupy those islands to prevent their falling into the hands of other powers. The British Government holds out the hope that their wishes will be gratified as soon as they shall combine in a strong political union, and show that they can, at some future time, take into their care and governance the new possessions, and meanwhile bear their share of the cost of the occupation, administration, and defense of these vast regions.

Postal Union.—A conference of delegates from all the colonies, except New Zealand, which refused to join, was held at Sydney, for the purpose of considering the question of adopting the arrangements of the Universal Postal Union. The meeting was called at the instance of Mr. Fawcett, the English Postmaster-General, who wished to have the votes of Australian delegates at the Lisbon conference in 1884, in order to help the interests of the British steamship lines. The Postal Union expects to reduce the maximum rate of ocean postage to ten cents a letter. The Sydney meeting took action in conformity with Mr. Fawcett's views, and appointed commissioners to attend the congress. The effect of the proposed arrangements will be to give the bulk of the business of carrying Australian mails to the Peninsular and Oriental Steamship Company, diverting that portion which is carried across the United States, and entailing losses on the colonies which have mail contracts with the Pacific Mail and other steamship companies. Such losses the colonies agreed to share with one another.

Defenses.—The various colonies are proceeding with the organization of a militia, and have already spent large sums in a system of coast defense fulfilling the latest requirements of naval science. The approaches to the principal ports are guarded by batteries mounted with modern artillery and by sunken torpedoes. A considerable fleet of powerful gunboats and torpedo-boats of improved construction is building for the colonial governments in England. Victoria ordered two gunboats, one of 530 tons' displacement and a speed of 12 knots, to carry a 25-ton gun, two smaller guns in the stern, and improved Gatling guns; the other, with a displacement of 350 tons and a speed of 10 knots, to be similarly armed, with a lighter gun in the bow. South Australia is having built a vessel which is rather a cruiser than a gunboat, with a displacement of 900 tons and a speed of 14 knots, to be armed with an 8-inch gun in the bow, four 6-inch broadside guns, another in the stern, and five

machine-guns. Queensland ordered two gun-boats identical with the smaller Victorian vessel. Victoria will have three torpedo-boats, New Zealand four, Queensland two, and Tasmania one. One of the Victorian boats is the largest yet constructed, except one built for the Russian Government, being 118 feet long, with a displacement of 58½ tons. It was launched in 1888, and is armed with four large Whitehead torpedoes and two Hodgkiss machine-guns. The smaller boats will be armed with McEvoy spar torpedoes, or Whitehead projectile torpedoes.

Annexation Schemes.—The impulse to colonial extension observed in European Continental nations, the result chiefly of their protectionist policy, and excessive expansion of industrial activity, diverted the movement for Australian confederation from its original purpose in 1888. The prospect of a further "division of the world" became more imminent after the British occupation of Egypt. France began the movement by casting about among the unclaimed regions of the earth for compensation. The Australian colonists, who at this time started embryonic military and naval establishments, and began to form a conception of the power of union, determined to take a stand against the establishment of any foreign colonies in Australasia, and to claim for Australia pre-emptive rights to all the islands of the Pacific. In the absence of a federal union, the colonies began individually to agitate for the annexation of the more important islands. European nations have for years debated over the question of establishing colonial plantations in Australasia. The party in Germany in favor of colonizing has directed attention by turns to every unoccupied group in Australasia, and nearly every other uncivilized region in the world. German commerce has been extending in the neutral markets, and the Government has given some tentative aid and protection in Polynesia; but the German Government is more cautious in this respect than any other, and has resisted every temptation to establish a dominion over uncivilized races. Italy has discussed various fields for colonizing, and claims a sort of priority in New Guinea, by virtue of the explorations of Beccari and D'Albentis. France, as the only active colonizing power, was the most dreaded by the Australians, and is the most firmly seated in Australasia, possessing New Caledonia, and having interests in the New Hebrides. In 1878 France and Great Britain entered into reciprocal engagements not to annex the New Hebrides. Since then a private company, composed of colonists of New Caledonia, has obtained trading concessions on those islands, and acquired some of the smaller ones by purchase. The colonists of New South Wales urged the home Government to acquire possession of the Solomon Islands and the New Hebrides, in order to prevent them from becoming French penal colonies. In New Zealand the old agitation for the annexation of

the Friendly and Navigator groups was renewed. But the oligarchy of Queensland, who, enriched by colored labor, consider it their vocation to rule over native races, showed the most impatient and aggressive spirit. They conceived the ambitious design of annexing to their little colony the great island of Papua, with its vast population and inexhaustible natural wealth. To establish a dominion over Papua, and derive any material benefit from the possession, would not only necessitate cruel oppression, which the mother-country would not permit, but would cost a long struggle, which would require considerable military resources. The Papuans are a brave and vigorous race, who live in large villages, cultivate the soil, and hold the land by fixed proprietary titles.

In May the British Foreign Office received a dispatch from the Governor of Queensland, saying that the Queensland Government, in order to prevent other powers from occupying Papua, had taken formal possession of that island in the name of the Queen. The home authorities, who had had knowledge of this purpose since February, would not allow their hand to be forced by the Queenslanders. They repudiated the proceeding of the Governor, which could only be consummated by the power of Great Britain. Yet Lord Derby asserted the pre-emptive claim of England to Papua, by declaring that they should "not view it as a friendly act if any other country attempted to make a settlement on that coast." They obtained assurances that the French Government had no designs on the island. The British Government would go no further than to extend its jurisdiction over the southern coast of New Guinea, between which and Australia a considerable trade had sprung up, by giving the High Commissioner of Feejee power to enforce discipline over British subjects.

The western half of Papua was claimed by Holland, by virtue of a cession from the Sultau of Tidore, in the Moluccas, a title like that of Portugal to the Congo Basin, which Great Britain might acknowledge, if expedient, and yet at any future time set aside. On the eastern end Lieut. Yule had raised the British flag in 1848, as did Capt. Moresby on the islands off the east coast in 1873.

The annexation of Papua by Great Britain had been mooted about five years before, when gold was discovered at Port Moresby on the south coast. There was a rush of gold-diggers to the spot, but the new field was not as productive as was supposed, and the hostility of the natives made it dangerous for the miners to remain and explore further. The Torres Strait, which separates Papua from the northern point of Queensland, is only 80 miles wide; but Brisbane, the capital of the colony, is 1,000 miles from the coast of Papua. The island, which Sir Thomas Mollwraith, the head of the Queensland Government, and Sir Arthur Kennedy, the Governor, attempted to add to the

colony, which has already five square miles of land to every male inhabitant, by a proclamation issued without consulting the home authorities, contains 312,000 square miles, and a population of several millions. The suspicion was generally entertained, and was intimated in Lord Derby's sharp reply, that the colonists wished to obtain an unlimited supply of black labor, without the restraint which the imperial authorities put upon the cruelties incident to that traffic. The main business of the British squadron on the Australian station is to police the seas, so as to keep in check this slaving trade. The island of Papua has never been explored, except along the coast, although D'Alberty, Miklucho-Maklay, and Lawes have penetrated a short distance inland. Powell, who lived eight years on the coast, considers it the richest island in the world in natural resources. Products which are obtainable in large quantities, and some of which are already objects of commerce, are tortoise-shells, pearl-shells, ivory-nuts, gums, sandal-wood, camphor, sago, arrowroot, ginger, sugar-cane, ebony, and bird-of-paradise plumes. Tobacco is produced in large quantities. Copper, tin, and gold have been found, but of the mineral resources of the island but little is known.

The British Colonial Office, after disposing of the presumptuous act of the Governor of Queensland, had a wider scheme of colonial extension presented to its attention by agents of all the colonies. They proposed the annexation of Papua, the New Hebrides, the Solomon Islands, and the islands in the neighborhood of Papua, and of the little-known islands to the north and northeast of Papua, comprising all together an area of over 300,000 square miles. The hope which Lord Derby held out to the colonies was that they should unite in a confederation and help to carry out their annexation schemes with their own powers. The conference of delegates from the legislatures of the different colonies which was held at Sydney in November to consider the question of confederation turned its attention to that of annexing the South Sea islands. The conference resolved that it would be highly injurious to the interests of Australia and the empire to have any foreign power acquire dominions in the southern Pacific, and therefore called upon England to take the initiative in taking possession of that part of Papua not claimed by Holland, and the neighboring islands, and to make arrangements with France to preclude that power from making conquests in these regions, and to induce it to relinquish the New Hebrides to British possession. The conference promised that Australia would bear its fair share in the cost of these enterprises.

Victoria was constituted a self-governing colony in 1854. The Legislative Council, of 86 members, is elective by a limited franchise, fixed by the law of 1881 at £10 annual rateable value of freehold property or the occupancy of rented or leased property rated at

£25 annual value for all except professional men. The term of the members, who must have property yielding £100 income, is nine years, one third retiring every three years. The members of the Legislative Assembly are elected for three years by universal suffrage. The bill of 1881 increased the electorate for the Legislative Council from 33,105 to 110,000. The electors for the Assembly number 176,022.

The Governor, who was appointed Dec. 10, 1878, and assumed office Feb. 27, 1879, is the Hon. George Augustus C. Phipps, second Marquis of Normanby, who has filled similar posts in Nova Scotia, Queensland, and New Zealand.

The area of Victoria is 87,884 square miles. The population on the 8d of April, 1881, was 862,846—452,083 males and 410,263 females—including 12,128 Chinese and 780 aborigines. The Chinese and natives have decreased greatly in the past ten years. About half of the total population live in towns. Those containing over 10,000 inhabitants in 1881 were as follows: Melbourne, 65,859 (including suburbs, 282,981); Sandhurst, 28,518; Emerald Hill, 25,374; Collingwood, 23,829; Richmond, 23,405; Fitzroy, 23,118; Ballarat, 22,411; Prahran, 21,168; Hotham, 17,839; Wahalla, 16,147; Ballarat East, 14,849; St. Kilda, 11,654.

The population of Victoria formerly increased rapidly by immigration, but owing to the withdrawal of the system of assisted immigration and other causes the influx has moderated greatly.

The total imports in 1881 amounted to £16,718,521, the exports to £16,252,108. The chief imports are woolen manufactures, live-stock, sugar, cotton, clothing, and tea. More or less grain is imported each year. The two staple articles, wool and gold, make the principal part of the exports. There were exported in 1881, 98,467,369 pounds of wool, valued at £5,450,029, and gold bullion of the value of £3,674,104. The quantity of gold produced, which averaged 2,000,000 ounces per annum in the first ten years after the discovery of the mines in 1851, and fell to 1,500,000 ounces in 1867, and below 1,000,000 in 1876, slightly increased with the application of the diamond-drill after 1878, while the number of miners employed has decreased in recent years. The number at the beginning of 1882 was 38,186, including 7,941 Chinamen. The value of the total quantity of gold produced since 1851 is estimated at £201,674,118.

The number of acres under cultivation in 1882 was 1,997,943. There were 4,919 acres of vineyards. In March, 1881, the census of live-stock gave 275,516 horses, 1,286,267 horned cattle, 10,860,285 sheep, and 241,936 pigs.

The mileage of railroads open to traffic at the close of 1881 was 1,214 miles, all belonging to the state. There were under construction 450 miles more. The system has been built in great part since 1875. The total cost was £18,608,880, the cost per mile £15,324;

net revenue, 4·04 per cent.; borrowed capital, £17,609,207, on which the interest charge is £918,218; gross earnings in 1881, £1,665,209; expenditure, £918,572; profits, £751,687. Two fifths of the receipts were from passenger and three fifths from freight traffic.

The number of miles of telegraph lines completed at the end of 1881 was 8,349; the number of messages, 1,281,749. Since 1870 the rate has been 1s. for ten words and 1d. for each additional word.

The revenue of the colony in 1881 was £5,114,460, the expenditure £5,102,470. The receipts for the year ending June 30, 1882, were £5,770,000, the expenditure £5,690,000. The public debt was £23,944,602 in 1881. In June, 1883, the total liabilities amounted to about £26,000,000. The net revenue from the railways and water-works for which the debt was incurred is stated by Mr. James Service, the Colonial Treasurer and Premier, to be sufficient to pay 4 per cent. on the total amount.

The O'Loughlen Ministry, which had already lost its popularity, was defeated at a general election in February in consequence of an unsuccessful financial operation in London. The ministry attempted to convert £3,800,000 of 6 per cent. bonds, falling due in October, 1883, into a new loan at 4 per cent. The books for a loan of £4,000,000 were accordingly opened in London in January. In insisting upon issuing the bonds only at par, the Premier came into collision with the English magnates of finance. A mere fraction of the stock was taken. The credit of Victoria had suffered from the frequent comparisons made between it and the more rapidly growing free-trade colony of New South Wales, and through the unpopularity in England of its protectionist policy. The momentary financial embarrassments of the Government, which had compelled it to obtain advances of £2,000,000, gave a colorable ground for the rejection of the loan. The Victorians were more astonished than discouraged, and attributed the result entirely to the blunders of the Ministry. The Cabinet preferred to make an appeal to the country rather than be voted out of office by the Parliament, which was to meet Feb. 13th. With the consent of the Marquis of Normanby a new election was ordered. It took place in the latter part of February. Only 14 Ministerialists were returned; Sir Bryan O'Loughlen himself lost his seat. The Liberal Constitutionalist party, led by James Service, elected 88 members, and the Radical or Democratic party of Graham Berry, 32. A coalition ministry was formed, March 7th, as follows: Hon. James Service, Premier, Colonial Treasurer, and Minister of Public Instruction; Hon. Graham Berry, Chief Secretary; Hon. George Briscoe Kerferd, Attorney-General; Hon. Albert Lee Tucker, Minister of Lands, Agriculture, etc.; Hon. Duncan Gillies, Commissioner of Railways and Roads; Hon. Alfred Deakin, Commissioner of Public Works; Hon. J. F. Levien,

Minister of Mines; Hon. George D. Langridge, Commissioner of Trade and Customs; Hon. W. Anderson, Minister of Justice; Hon. Mr. Sargood, without portfolio. The financial statement made April 4th charged the former Minister of Railroads with imprudence in entering into contracts for rails and rolling-stock to be manufactured in the colony beyond the amounts sanctioned by Parliament, causing the estimated expenditures to be exceeded. The loan of £4,000,000 was placed by the new Government, by acceding to the demands of the London bankers, at only a slight discount, the Government pledging itself to borrow not more than £2,000,000 additional during that year. The finances of the colony were described by Mr. Service to be in no critical condition, though the sales of public lands had been declining for two or three years; but the maturity of the old debt, which would require £3,000,000 more to be raised in 1884 and £4,000,000 in 1885, puts a stop temporarily to large expenditures on public works. The legislative programme of the new ministry embraced the reform of the civil service by delivering it from political patronage and intrusting official appointments to a permanent board; the creation of a board of commissioners to manage the state railroads; the extension of the system of irrigation and water conservation by local authorities; and the introduction of pastoral leases to apply only to the "mallee scrub" lands of inferior quality which are overrun with rabbits, the leases for twenty years being made conditional on the tenants' exterminating noxious animals.

The tariff controversy was continued during the year, and the Commission of Inquiry collected evidence from all classes. Invidious comparisons with the rapid growth of New South Wales are not considered just by the Victorians, as their colony has no unlimited sheep pasturage to invite immigration. The flocks of Victoria have scarcely increased since 1873, while those of New South Wales have nearly doubled. Though the population of Victoria increases slowly, the growth in wealth is steady, and the progress is marked in agriculture and cattle-raising. The herds increased from 883,763 head in 1873, to 1,286,267 in 1881. The protected industries do not show the same healthy growth, and the rural community is becoming more and more dissatisfied with the protective policy, which favors the working-classes of the towns at its expense.

New South Wales, the oldest Australian colony, originally a penal settlement, and formerly including the present colonies of South Australia, Victoria, and Queensland, obtained responsible government in 1855. The Legislative Council consists of 21 or more members, nominated by the Crown. The Legislative Assembly consists of 108 members, elected by 72 constituencies by universal suffrage and secret ballot. The Governor is Lord Augustus W. F. S. Loftus, born in 1818, formerly British ambassador

to Austria, Germany, and Russia, who entered upon the office Aug. 4, 1879. The ministry is composed as follows: Colonial Secretary and Premier, Hon. Alexander Stuart; Treasurer, Hon. George Dibbs; Minister of Justice, Hon. Henry Cohen; Minister of Public Instruction, Hon. George H. Reed; Attorney-General, Hon. W. Bede Dalley; Minister of Public Works, Hon. Henry Oopeland; Postmaster-General, Hon. F. A. Wright; Minister of Mines, Hon. Robert P. Abbott; Secretary for Lands, Hon. James Squire Farnell; Vice-President of the Council, Hon. Sir Patrick Jennings.

The area is 828,487 square miles. The population in 1881 was 751,468, of whom 411,149 were males and 340,319 females. The immigration in the seven years ending with 1880 averaged 10,000. The birth-rate is high. The population of Sydney, the capital, in 1881, was 220,427, having increased 66.25 per cent. in ten years.

There entered the port of Sydney, in 1881, 2,254 vessels, of the aggregate tonnage 1,456,239 tons. The tonnage of the port of Newcastle was almost as large.

The total exports of New South Wales in 1881 amounted to £16,049,508, the imports to £17,409,326, both larger than in any previous year. Over one third of the trade is with Great Britain; the rest is mainly with the other colonies. The leading export article is wool, of which 87,739,914 pounds, valued at £5,304,576, were shipped to England in 1881. The chief exports next in order are tin, copper, tallow, and preserved meat.

In March, 1882, the colony had 83,062,854 sheep, 2,180,896 cattle, 346,931 horses, and 218,916 swine. The total area under cultivation was 645,068 acres, about one half of which was under wheat and maize. New South Wales is richer than the other colonies in coal, of which 1,775,224 tons were raised in 1881. The gold production in 1881 was £550,111, about the average of the last five years, having suddenly fallen off from £2,097,740 in 1875, and £1,589,854 in 1876.

In 1881 there were 995 miles of railroad in operation, and 487 miles under construction. Sydney has 11½ miles of steam tramways, a system which is to be extended to some of the neighboring towns. The Colonial Treasurer asserts that though the railroads of New South Wales were laid out and are rapidly extended for the purpose of developing the country, and although the Government fixes the tariff lower than in the other colonies for that object, yet they return a higher rate of profit on the capital invested than any other railroads in the world.

The telegraph lines completed at the end of 1881 were 14,278 miles, constructed at a cost of £492,211.

The public revenue of New South Wales in 1881 amounted to £6,707,963, the expenditure to £5,890,579. The estimated revenue for 1882 was £6,240,000, the expenditure £5,-

960,000. The actual revenue was £7,062,873, and showed a surplus of £1,848,000. The revenue for 1883 was estimated at £6,819,200, the expenditure at £6,483,000.

The public debt, increased by an issue of £2,000,000, in 1882, was at the end of that year £18,924,019. In 1882-'83 loans to the amount of £3,000,000 were placed in London. The sums expended by the colony on railroad and telegraph construction amounted at the end of September, 1882, to £17,078,654. The revenue from these public works exceeds the interest on the public debt. The railroad system could be sold out to capitalists, according to the calculation of Mr. Dibbs, for £25,000,000. Besides the railroads and the public lands, the assets of the colony include £12,000,000 owing to it from conditional purchasers of land.

The financial policy of the new Cabinet, which came into office in January, 1883, is to restrict sales of land as much as possible pending the new land legislation, thus reducing the surplus revenue. A revision of the tariff is in prospect after the land question is settled.

The Parliament of New South Wales was suddenly and unexpectedly dissolved in November, 1882. The Government had placed before Parliament a land bill, which was, with slight amendments, a consolidation of the various land laws embodying the system first introduced by Sir John Robertson in 1861. The Robertson policy was hailed at the time it was adopted as a triumph of democratic principles. It allows the free selection of lands by actual settlers anywhere upon the tracts occupied on pastoral leases as sheep-runs by "squatters," or Government leaseholders. This provision has not prevented the building up of huge pastoral estates in accordance with the natural and economical conditions which prevail in Australia, nor promoted to any extent the immigration of settlers and the agricultural development of the country. But it depreciated the value of the public lands and prevented the Government from obtaining the best value on leases or sales. It has also brought about economical conditions which are regarded with grave apprehensions by the younger statesmen. The squatters have been impelled by reason of the insecurity of their tenure to strain their credit in order to obtain the freehold of their runs. The portions which they can not borrow the means to buy at auction they endeavor to keep out of the hands of actual settlers by inducing dependents and dummies to free-select the desirable sections. Illegal and violent means are often resorted to for the purpose of fighting away interloping settlers. The consequence of this state of things is, the creation of a class of large landholders more rapidly than if the Robertson law did not exist, and of landholders whose property is deeply mortgaged at heavy interest to absentee capitalists. Sir Henry Parke, the Premier, agreed to a dissolution, although the Parliament had but one year to run, and the adoption of the tri-

ennial period was intended to prevent avoidable dissolutions, and although Sir Henry Robertson was alone responsible for pressing the measure, and the country was with the coalition ministry on every other question. The party opposed to the perpetuation of the existing land system proposed to limit the right of free selection on unsurveyed lands and allow a large portion of the colony to remain under pastoral leases, but without giving to squatters the power of purchase. In the elections in December, 1882, Mr. Watson, the Treasurer; Dr. Kenwick, the Minister of Mines; and Mr. Foster, the Minister of Justice, lost their seats; Sir Henry Robertson was barely elected, and Sir Henry Parke was defeated in his own district, and took the place of a candidate who retired in his favor. A new ministry was formed by Mr. Alexander Stuart.

A Commission of Inquiry reported in May upon the facts governing the land question. The territory of New South Wales is divisible into three parts. The old settled portion, consisting mainly of the land lying between the sea and the Blue Mountains, contains 500,000 inhabitants, including 220,000 in Sydney and 117,000 in other towns, and has an area of 26,000,000 acres, of which 9,000,000 have been alienated, consisting of all the best lands. This land was not occupied in pastoral squatting leases, but in the form of freeholds of moderate size, with grazing rights over an additional space. The result is stated to be a beneficial division of the land and settlement by families, with few estates exceeding 5,000 acres. The second division, comprising the nearer inland districts as far as the Barwon river and the confluence of the Murrumbidgee and the Murray, on the frontier of Victoria, is the largest of the three, and contains the finest lands, such as the rich plains of the Clarence and Macleay rivers, and the valuable grazing districts of New England, Liverpool Plains, Gwydir, Dubbo, Deniliquin, the Upper Murray, Monaro, and Twofold Bay. It has a total area of 86,000,000 acres, and a population of 223,560 souls, of whom 88,178 live in the towns. This region was settled under the land laws of 1862. The class-conflicts which arose between the squatters and the free-selectors are said to have wasted the resources of the settlers and embittered social life. The quantity of land which has passed into private ownership is 25,156,000 acres. In the Deniliquin and Wagga Wagga districts only one eighth or less of the nominal owners remain on the land, much more than half the farms ostensibly free-selected for agricultural purposes having been taken up at the procurement of lessees of pastoral runs. The third division contains the broad plains, well adapted to pastoral purposes, which are traversed by the Darling river. This region contains but few inhabitants as yet. Very few sales have been made to settlers, and these are mostly of the same fictitious character as in the second division. The

effect of the land laws, according to the commission, has been not only to divide the rural community into two hostile camps, and to waste the lives and fortunes of numbers of persons in litigation, but "the personal virtues of veracity and honorable dealing have been tarnished by the daily habit of intrigue, by the practice of evading the law, and by declarations universally made in defiance of fact: self-interest has created a laxity of conscience in these matters; the stain attaches to men of all classes and degrees."

The revision of the land laws inaugurated by the Stuart ministry proceeds on the principle of restricting the right of free selection to a limited portion of each pastoral leasehold and giving the squatter a more secure tenure of the remainder. Under this system the Government expects to exact a considerably higher rent from the squatters.

South Australia was invested with representative government in 1856. The Legislative Council consists of 24 members elected from four districts, one third of whom retire every three years. The electoral qualifications are the possession of real estate of £50 value or leased premises of £20 annual value. The House of Assembly, elected by universal suffrage, consists of 46 members. The Governor of South Australia is Sir William C. T. Robinson, previously Governor of several minor colonies, appointed in November, 1882. The Executive Council is composed as follows: Chief Secretary, Hon. J. Cox Bray; Attorney-General, Hon. John W. Downer; Chief-Justice, Hon. S. J. Way; Treasurer, Hon. Lavington Glyde; Commissioner of Crown Lands, Hon. Alfred Catt; Commissioner of Public Works, Hon. James Garden Ramsey; Minister of Education, Hon. John Langdon Parsons.

The estimated area of South Australia is 908,425 square miles. The population on April 3, 1881, was 279,865, of whom 149,530 were males and 180,385 females, including 2,784 Chinese, but exclusive of the aborigines, numbering 6,346. The population of Adelaide, the capital, was 38,479 without the suburbs.

South Australia is the leading agricultural colony. The area under cultivation increased from 739,714 acres in 1866 to 1,444,536 in 1876, and 2,618,908 in 1882, of which 1,768,781 acres were sown to wheat. The live-stock census showed 159,878 horses, 814,918 horned cattle, and 6,810,856 sheep.

The total exports in 1882 amounted to about £5,280,000, the imports to £5,890,000. The staple articles of export are wool, wheat, and flour, and copper-ore. The wool exports were valued in 1881 at £2,345,231. The grain exports were of the value of £82,092 in 1876; £514,176 in 1877; £514,176 in 1878; £464,049 in 1879; £1,025,077 in 1880; and £496,741 in 1881. The exports of copper in 1881 amounted to £179,731. Besides copper there exist iron-ores of great richness.

There were 945 miles of railroad in opera-

tion in July, 1882, and 174 miles in the course of construction. The length of telegraph lines completed at the end of 1881 was 4,946 miles.

An intercolonial railroad is projected which will connect Adelaide with Melbourne. The Murray Bridge or Callington route, chosen by the Government, is criticised by many. The large falling off in the grain exports has had a depressing effect on the colony, and has affected the revenue. A proposed property tax of a penny in the pound is strongly opposed. The land law has been amended so as to allow purchasers on deferred payments to surrender their holdings, with remission of the remaining installments.

Queensland was separated from New South Wales and endowed with responsible government in 1859. The Legislative Council consists of 80 life-members nominated by the Crown, the Legislative Assembly of 55 members elected for five years. Every tax-payer has a vote, and every property-owner or leaseholder one in the district in which the property is situated as well as in the district in which he resides.

The Governor of Queensland is Sir Anthony Musgrove, formerly Governor of Jamaica, who was appointed in 1888. The late Governor, Sir Arthur Edward Kennedy, who held the office six years, died after his recall, on the voyage to England. The Ministry is composed as follows: Colonial Secretary and Premier, Hon. Sir Thomas McLlwraith; Colonial Treasurer, Hon. A. Archer; Secretary for Public Works, Hon. John M. McCrossan; Secretary for Public Lands, Hon. Patrick Perkins; Postmaster-General, Hon. Boyd Dunlop Morehead.

The area of Queensland is 668,224 square miles. The coast-line measures 2,250 miles. The population in 1881 was 213,525, divided into 125,325 males and 88,200 females, including 11,229 Chinese engaged in the gold-mines and 6,848 Polynesians, but not including the aborigines, estimated at 20,585. The capital, Brisbane, had 31,109 inhabitants. The immigration from the United Kingdom declined after the introduction of Chinese and Polynesian laborers.

The total imports in 1881 amounted to £3,601,906, the exports to £3,289,353. The leading article of export is wool, which is shipped to England to the value of over £800,000 a year. Preserved meat and tallow are also exported. The cultivation of cotton and sugar-cane, recently introduced, is growing rapidly. The total area under cultivation in the beginning of 1883 was 128,875 acres, of which 28,026 acres were planted to sugar-cane. The live-stock at the beginning of 1882 numbered 194,217 horses, 3,618,513 cattle, 8,292,888 sheep, and 56,438 hogs. There are several coal-mines worked in the colony. The value of the gold product declined from £1,306,431 in 1877, ten years after the discovery of gold, to £925,012 in 1881.

At the beginning of 1882 there were 800

miles of railroad in operation, and 200 miles in process of construction. A trans-Australian line from Brisbane to Port Darwin was begun in 1882. The telegraph mileage was 6,279.

In Queensland, besides the appropriation of the land by monopolists, there exists the form of slavery known as "indentured labor," an evil now found in no other Australian colony. The culture of sugar in the sub-tropical portion of the colony is so profitable that free white settlers who penetrate beyond the occupied districts to raise the cane and evaporate the juice are better repaid than in any other occupation now open in Australia. Yet the laws allowing bound labor are kept on the statute-book by the influence of the large planters, on the plea that the product can only be cultivated by colored labor, and that colored labor can only be made effective by special sanctions. Until recently, veritable slavers supplied the labor market by enticing away or capturing in violent raids the natives of the Polynesian islands. But an outcry was made in England which led to a parliamentary inquiry. The revelations of these piratical raids and of the cruelties and frauds practiced upon the Kanakas in Queensland, which resulted in the appointment of a commission, consisting of Sir A. Gordon and the two naval commanders on the station, to consider means of punishing crimes committed on the Pacific islands by British subjects, discouraged further importations of Pacific-islanders. The planters then turned to Ceylon and Southern India. Cingalese and Bengalee coolies are brought by speculators, to whom they have, or are supposed to have, contracted their labor for a term of years, and are by them transferred to the sugar-planters. The employment of colored labor is restricted by statute to the sugar-estates on the northern coast. The term of service is limited to three years, after which they have to be sent back at the expense of their employers. The white laborers, who through a low franchise exert great political power, and to please whom a tax of £10 a head is imposed on Chinese immigrants, are in favor of restricting colored labor. The laborers are subjected to official inspection. Nevertheless, as the native races are not permitted to testify in the courts, they are not protected against any form of cruelty or injustice. According to a statistical statement cited by Lord Lamington, there were imported into Queensland, within a comparatively few years, the large number of 17,329 black laborers.

Tasmania, constituted a self-governing colony in 1871, has two Houses of Parliament, elected by suffrage limited by property qualifications of different degrees. The Governor is Maj.-Gen. Sir G. Cumine Strahan, transferred from the governorship of the Windward Islands in August, 1880. The head of the responsible ministry is Hon. William R. Giblin. The revenue in 1881 was £502,417; expenditure, £466,818; estimated revenue in 1883, £530,000; ex-

penditure, £457,242. The public debt, raised for the construction of public works, was on Dec. 31, 1881, £2,008,000, bearing interest at 6 per cent.

The area is estimated at 26,215 square miles, or 16,778,000 acres, including the adjacent islands. The population in 1881 was 115,705, of whom 61,162 were males and 54,543 females. The increase in eleven years was but 16,877. The aborigines are entirely extinct. The exports in 1881 amounted to £1,555,576, the imports to £1,488,524. The chief articles of export are wool and tin, and more recently gold. The valuable deposits of tin and iron and the discovery of gold have given a slight impetus to enterprise and immigration, but in agriculture the colony has receded; barley, the quality of which is superior, is the only crop except potatoes that has increased.

New Zealand was organized in six provinces in 1852, and united under a Governor and General Assembly in 1875. The members of the Legislative Council are appointed by the Crown for life. The House of Representatives consists of 95 members elected by household suffrage. The Maoris are represented by four members elected by themselves.

The Governor is Maj.-Gen. Sir William Francis Drummond Jervois, transferred from South Australia in November, 1882.

The Premier, Mr. Whitaker, resigned the office in 1883—not, however, for political reasons. He was succeeded by Maj. Atkinson, the Colonial Treasurer.

The area of New Zealand is estimated at 105,342 square miles. Two thirds of the total surface is good agricultural or grazing land. The census of 1881 gave the total population as 534,032, including the Maoris, who numbered 44,099, divided into 24,370 males and 19,729 females; of the rest, 269,605 were males and 220,328 females. The Chinese numbered 5,004. The towns with more than 10,000 inhabitants were Dunedin (24,372—with suburbs, 48,802), Auckland (16,664—with suburbs, 39,966), Wellington (20,563), and Christchurch (15,213—with suburbs, 30,719). The population of New Zealand is increasing faster than that of any of the Australian colonies, both by immigration and by a high birth-rate.

The total imports in 1881 amounted to £7,457,045, the exports to £6,060,866. The quantity of wool exported was 59,868,832 pounds; value, £3,477,998. Grain and flour were shipped to Great Britain in 1881 to the value of £913,581. Gum and preserved meat are, except gold, the next most considerable articles of export. There were in April, 1881, in the colony 161,736 horses, 698,637 cattle, 12,985,085 sheep, and large numbers of hogs and poultry. The New Zealand gold-fields, discovered in 1857, and yielding at the height of their production in 1877, £1,496,080, produced in 1881, £996,867.

The railway system of New Zealand was begun in 1872. In 1882 there were 875 miles

completed on the South Island and 458 on the North Island. When completed, the system is to have 2,075 miles of line, and will cost £16,000,000. The capital already expended in 1883 was about £11,500,000. The railroads in the South Island already return 8 per cent. on the outlay, those in the North Island 1½ per cent. There were 3,824 miles of telegraph open to traffic in March, 1882.

The revenues of the Government are derived partly from customs receipts, etc., and partly from sales of public lands, depasturing licenses, export duties on gold, and mining licenses. The latter category, called the territorial revenue, was, down to 1879, nearly as productive as the ordinary sources of revenue. In 1882 the ordinary revenue amounted to £3,488,170, the territorial revenue to £317,063; total revenue, £3,805,233. The total expenditure was £3,590,233. The estimated revenue for the year ending March 31, 1883, is £3,393,500; expenditure, £3,478,639. The public debt amounted in 1882 to £29,946,711. At the end of March, 1883, it was £30,357,000, not deducting the sinking fund, amounting to £2,571,000. Notwithstanding the magnitude of its liabilities, the colony obtained a loan of £1,000,000 in London in 1883 at 4 per cent. at a very slight discount. This state of the credit allows the considerable floating debt to be converted at a reduced interest.

The Government has introduced proposals in the Legislature to change the constitution of the Legislative Council, making it an elective body, as in the older colonies, instead of the members being appointed for life by the Governor.

The difficulties with the Maoris in the western part of the North Island have ceased. The natives have abandoned their attitude of exclusion and isolation, and given pledges of peaceful submission to the laws. The pressure of public opinion in England has put some restraint upon the oppressive and confiscatory instincts of the colonists. Improvements are being introduced in the Maori country, and intercourse between the natives and the white settlers who have penetrated there has a beneficial influence on both races. The harbor of Kawhia, after being closed for twenty years, was opened again without opposition from the natives. A government township was laid out at that place. Surveys for roads and railways have extended into parts of the country where formerly no European was suffered to travel.

AUSTRIA-HUNGARY, an empire constituted since 1867 as a dual monarchy. The Cisleithan Kingdom, or Austria, and the Transleithan, or Hungary, are connected by a common army, navy, and diplomacy, and in the person of the hereditary sovereign. The house of Hapsburg has reigned over Austria for six hundred years, and has possessed the Hungarian crown for more than half that period. Franz Josef I., reigning Emperor of Austria and King of Hungary, was born Aug. 18, 1830, and suc-

ceeded his uncle, Ferdinand I., who abdicated in 1848. The heir-apparent is the Archduke Rudolf, born Aug. 21, 1858.

Government.—The common affairs of the two monarchies, restricted to military defense and foreign policy, are regulated by the Delegations, consisting of 120 members, chosen in equal numbers from the Austrian and Hungarian legislatures—20 from the upper and 40 from the lower house of each. The common Ministers, responsible to the Delegations, are as follow: Minister of Foreign Affairs and of the Imperial Household, Count G. Kalnoky de Köröspatak, born in 1832, Minister to Rome, 1879-'80, and then at St. Petersburg until he was called to the head of the administration, Nov. 21, 1881; Minister of War for the whole empire, Count Bylandt-Rheydt, appointed June 21, 1876; Minister of Finance for the whole empire, Baron von Kallay, appointed June 4, 1882.

Area and Population.—The total area of the Austro-Hungarian Empire, exclusive of the occupied provinces, is 240,942 square miles; the total population was returned in the census of Dec. 31, 1880, as 87,786,246, or 159 to the square mile. The population increased in eleven years in Cisleithania, 8·5 per cent.; in Hungary only 1·24 per cent. In Transylvania there was an actual decrease of 70,000. The area and population of the separate provinces of the two monarchies were as follow:

PROVINCES OF THE EMPIRE.	Square miles.	Population.
AUSTRIAN MONARCHY:		
Lower Austria (Unter der Ens).....	7,654	2,290,621
Upper Austria (Ober der Ens).....	4,681	759,620
Salzburg.....	2,767	163,570
Styria (Steiermark).....	8,670	1,318,697
Carinthia (Kärnten).....	4,005	243,780
Carniola (Krain).....	3,856	481,948
Coast Land.....	3,084	647,984
Tyrol and Vorarlberg.....	11,224	912,549
Bohemia (Böhmen).....	20,060	5,560,819
Moravia (Mähren).....	8,538	2,132,407
Silesia (Schlesien).....	1,987	565,475
Galicja (Galizien).....	80,307	5,953,907
Bukowina.....	4,085	571,671

Transylvania (Siebenbürgen).....	21,215	2,084,048
Town of Fiume.....	8	20,981
Total, Hungary	125,089	15,642,009
Total, Austria-Hungary	240,942	87,786,246

The Principality of Liechtenstein in the Austrian Alps, with an area of 68 square miles and 9,124 inhabitants, is nominally independent, and its people are not subject to taxation or military duty. The provinces of Bosnia and Herzegovina and the Sanjak of Novi-Bazar, were placed provisionally under the administration of the common authorities by the Berlin Treaty of 1878. Their population numbered 1,326,453, of whom 448,613 were

Mohammedans, 496,761 Greek Orthodox Christians, 209,391 Roman Catholics, and 3,439 Jews.

The population of the cities in Austria and Hungary containing over 50,000 inhabitants, was as follows—In Austria: Vienna, 726,105, with suburbs, 1,103,857; Prague, 162,323; Trieste, 144,844; Lemburg, 109,726; Gratz, 97,791; Brünn, 82,660; Krakau, 66,095. In Hungary: Buda-Pesth, 860,551; Szegedin, 78,675; Holdmező-Vásárhely, 50,966; Maria-Theresiopel, 61,867.

Among the population of Cisleithania, the principal religious confessions were represented by the following numbers: Roman Catholics, 17,693,648; Greek Catholics, 2,533,323; Israelites, 1,005,894; Greek Oriental, 492,088; Evangelicals of the Augsburg Confession, 289,005; of the Helvetic Confession, 110,525.

The percentage of the various nationalities was as follows: Germans, 36·75 per cent.; Czechs, 23·77; Poles, 14·86; Ruthenians, 12·81; Slovenes, 5·28; Italians, 3·07; Serbs and Croats, 2·58; Roumanians, ·88; Magyars, ·05. The Israelites have increased since 1869 22·58 per cent., the Italians 18·19 per cent., the Poles 9·97 per cent., the Czechs 8·69 per cent., the Serbs and Croats 7·77 per cent., the Ruthenians 7·71 per cent., and the Germans 7·25 per cent. The Slovenes have decreased considerably, owing to their adoption of the nationality of the Germans in Carinthia and Lower Styria, and in the coast-lands of that of the Italians, who received accessions also from the Serbo-Croats.

The percentage of the population of Austria who could neither read nor write was 44·5, among the males 43·2, among the females 45·8; percentage of those who could read only 6·1, among males 4·6, among females 7·5; percentage of those who could read and write 49·4, among males 52·2, among females 46·7. In the Bukovina the percentage of illiterates was 89·7, in Dalmatia 89·3, in Galicia 81·1, in Istria 77·8, in Borizia and Gradisca 60·3, in Carniola 54·1, in Trieste 38·9, in Carinthia 47·6, in Styria 37·8, in Bohemia 22·6, in Moravia 24·8, in Silesia 25·8, in Salzburg 22·9, in Tyrol 22·7, in Lower Austria 21, in Upper Austria 20·2, and in Vorarlberg 16·2.

The following table gives the millesimal proportions of the population of the Cisleithan lands engaged in the various classes of employments, including families and dependents:

PROFESSIONS.	Per mille.
Agriculture.....	583·20
Industry and mining.....	264·25
Mercantile employments and transportation.....	55·64
Professions requiring a higher education.....	38·64
Property-owners and pensioners.....	31·67
Laborers.....	13·11
Employed in educational and charitable institutions.....	5·54
With no known occupation.....	2·05
Total	1000·00

Statistics collected by the Hungarian Government bureau show that the ratio of the Magyar-speaking portion of the population has increased only 1 per cent. in sixty years. In

the capital, where the Germans are more pliant in changing their language than the Slavic population of the provinces, particularly since the recent Magyar agitation has made it more to their interest to do so, the extension of the national language has been greatest. The proportion of children under five years of age speaking the Magyar tongue in Buda-Pesth is 47 per cent., against 45.7 per cent. among persons between fifty and sixty years of age. Of the Germans in Hungary as many as 21 per cent. are acquainted with the Magyar language; but of the Slovaks not 10, and of the Roumanians and Ruthenians not 6 per cent. The German language is extensively cultivated, over 10 per cent. of the Magyars acquiring it for commercial intercourse or education and travel. In the kingdom there are 817,668 non-Magyars who can speak Hungarian, and 791,670 non-Germans who speak German. The progress of education has been remarkable, 46 per cent. of the 10,844,000 above the age of seven being able to read and write in 1880, against only 25 per cent. in 1870.

Commerce, Industry, and Agriculture.—The total value of the imports and exports of the Austro-Hungarian Empire for the last three years reported, was as follows, in florins:

YEAR.	Imports.	Exports.
1879.....	551,390,000	675,140,000
1880.....	607,640,000	666,370,000
1881.....	634,490,000	717,390,000

The export of flour, which averaged, just before the enactment of the German corn-duties, about 2,400,000 metric quintals, has fallen to half that quantity. Owing to the active trade in live hogs with Servia, the imports and exports of live animals were considerably larger in 1881 than in the preceding year. The commercial treaty with Servia, ratified in June, 1883, secures the entrance of certain Austrian products at half the ordinary duties, and on the other hand a reduction of the Austrian duties on live hogs, and Servian wines, prune-brandy, etc. The exceptional treatment of German partly manufactured products, which was kept up as compensation for possible advantages to be extended to Austria-Hungary in the German tariff, ceased from the beginning of 1883 to operate as regards textile manufactures imported for printing, dyeing, or bleaching, the most important branch of this trade. The importation of lard and pork products showed a great decrease in 1881, in consequence of the prohibition of American pork. The export of wines, stimulated in 1880 by the failure of the French vintage, decreased from 905,841 to 438,213 metric quintals. The import of petroleum increased from 1,150,000 to 1,480,000 metric quintals. Cotton and other textile materials were imported in considerably larger quantities than in the preceding year. The continued large importation of yarns strengthened the spinners in their demand for a protective

duty. A marked improvement in the industrial situation and the consumptive capacity of the people is indicated by a larger importation of raw stuffs of various kinds, of colonial wares, of machinery, of textile manufactures, and of articles of luxury, and an increased exportation of textiles, paper manufactures, fine leathers, chemical products, etc.

More than half the export and import commerce of the Austrian Empire is with Germany, next to which the chief market is Roumania, which receives 50,000,000 florins of the exports, and furnishes 40,000,000 florins of the imports. Italy and Russia follow, but with a much smaller trade.

Precious Metals.—The movement of the precious metals in 1881, as compared with the previous year, was as follows, in florins:

SPECIE.	Imports.	Exports.	Excess of imports.
1880:			
Gold	22,300,000	3,200,000	19,000,000
Silver	7,100,000	15,400,000	8,300,000*
Total	29,300,000	18,600,000	10,700,000
1881:			
Gold	19,800,000	3,200,000	17,600,000
Silver	16,100,000	1,200,000	14,900,000
Total	35,900,000	4,400,000	32,500,000

Customs.—The Hungarian Legislature passed a law in 1881, denounced by the Constitutional party in the Austrian House of Deputies as an infringement of the customs-union, which requires a declaration to be made of all goods imported into or exported from the kingdom. According to the statistics collected for the last eight months of 1881 in pursuance of this regulation, Hungary has a balance decidedly in its favor in the trade with Austria as well as with other countries. The returns exhibit the total value of imports as 185,800,000 florins, of which 189,080,000 florins came from Austria; and the total value of exports as 242,800,000 florins, of which 165,250,000 florins were shipped into Austria.

Hungary.—Although in the social life of Hungary certain vestiges of feudalism survive the development of liberal political institutions, she strives to keep abreast of economical progress; people and Government uniting their efforts to develop all their resources under the pressure of American competition. The great richness of the Hungarian soil is counterbalanced by adverse geographical and climatic conditions which warn them against remaining a purely agricultural state. It is only by gigantic protective works and a more and more intensive culture that they can still hold their own. The invention of the Hungarian method of flour-milling, made necessary by the hard quality of their wheat, which has since been adopted and improved in the United States, marked the beginning of industrial development. A regular line of vessels from

* Excess of exports.

Fiume facilitates the export of Hungarian flour, which is now largely consumed in England. The new beet-sugar culture and manufacture are not sufficient to supply the home demand; but high-wines and refined spirits are exported as far as Spain. The wine production repays the encouragement bestowed upon it by the Government. The wines are produced in greater quantities, and of better and more uniform quality, and are shipped by the cargo to Bordeaux to replace the diminished growths of France. The number of persons engaged in industrial occupations proper increased between 1870 and 1880 from 784,378 to 908,958, or 14 per cent., while the whole population increased only by a small fraction.

Manufactures.—Unable to resort to protection, owing to the customs-union with Austria, Hungary employed other methods of encouraging industry. Hungarian manufacturers have the preference in Government and municipal orders, if they can produce articles of satisfactory quality. In the iron industry there are the imperial railroad works at Oravioza and Resitz, for which the best technical skill in France was imported; the shops of the Hungarian state railroad, which excel in the production of iron bridges; and various private establishments which stand on the highest plane of technical art. Leather, paper, pottery, and glass are also manufactured successfully on a large scale; but the important branch of textile industry is represented only by factories which subsist on the Government commissions for the supply of the army, although the country produces an abundance of wool of superior quality. By a law which went into effect on Jan. 1, 1882, industrial establishments which found new industries, or utilize products previously wasted, are exempted from all public dues and taxes. This and other measures of the kind led to the establishment of some two hundred factories in new branches. In museums, industrial exhibitions, a national school of mechanical drawing, a technical school for wood-workers, industrial evening-schools, etc., the Government has co-operated with private individuals in fostering technical education and industrial art. A review of the industrial progress already attained is to be made in a national exposition in 1885.

Live-Stock.—The live-stock census of the empire shows that horned cattle, which decreased between 1857 and 1869, increased between the latter date and 1880 from 7,425,212 to 8,584,077; while sheep, in consequence of the Australian production, decreased from 5,028,898 to 3,841,340. American competition and the German protective tariff are beginning to exercise a depressing effect on the wheat-growing, flour-milling, and cattle-raising interests of Hungary and Austria. There have been actual importations of American wheat.

Mining.—The total net value of the product of the mines and furnaces, after deducting the value of the ores, together with that of the sa-

lines, was 83,790,378 florins in 1881, as against 79,988,819 florins in 1880.

Railways.—The total length of railways in the empire, open to traffic in 1882, was 11,480 miles, of which 7,180 were in Austria and 4,350 in Hungary. There were, besides, 177 miles in Bosnia. The length of railway owned or operated by the state, at the close of 1881, was 2,912 kilometres, or 24 per cent. of the total mileage. To this was added on the 1st of January, 1882, the Empress Elizabeth railroad, 922 kilometres in length, which was taken over into the management of the state under a convention providing for its eventual acquisition. On the 1st of July, 1882, a railroad bureau was created for the direction of the state railroads. The total receipts of the Austro-Hungarian railroads in 1881 were 215,950,000 florins, of which 47,950,000 florins were from passengers, and 168,000,000 florins from freight.

Telegraphs.—The length of telegraph lines in 1881 was 21,785 miles in Austria, with 56,862 miles of wires, and 9,082 miles in Hungary, with 82,380 miles of wires. The number of messages carried in 1881 was 8,865,030, including 584,059 official dispatches.

Post-Office.—The number of letters forwarded by the post-office in 1881 was 248,509,000, besides 47,858,000 postal-cards in Austria, and in Hungary 74,218,000 letters and 13,628,000 postal-cards.

Shipping.—The merchant marine in 1882 numbered 70 ocean-steamers, of 16,145 horse-power and 62,837 tons; 42 coasting-steamers, of 2,179 horse-power and 4,472 tons; and 8,294 sailing-vessels and fishing-smacks of 259,970 tons. The crews numbered 27,187 men. The Austro-Hungarian Lloyd, which owns the large steamers and does the greater part of the carrying trade between Austria and the East through the Suez canal, receives a subsidy of 1,780,000 florins per annum.

The number of vessels entering the Austrian and Hungarian ports, Trieste and Fiume, in 1881, was 47,045, of 5,911,865 aggregate tonnage, of which 19,415, of 4,947,399 tons, were steamers; the number of departures was 46,907, tonnage 5,913,720, of which 19,392, of 4,942,078 tons, were steamers. The tonnage entering Austro-Hungarian ports under the national flag was 5,197,855; under the British flag, 402,164; under the Italian, 201,603.

Finance.—The budget estimates of revenue and expenditures for common affairs in 1882 place the total at 117,149,549 florins, of which the contributions from the two halves of the empire make up 113,824,679 florins (one florin = 50 cents). Of the total sum, 101,591,380 florins are devoted to the army, 9,177,829 florins to the navy, 4,328,900 florins to the diplomatic service, 1,926,040 florins to the financial administration, and 125,400 florins, to the financial control.

The estimates for 1883 make the expenditures 184,661,988 florins, of which 102,413,318

florins are required for the army, 9,162,224 florins for the navy, 4,246,900 florins for foreign affairs, and 1,962,661 florins for the finance ministry. There are extraordinary expenses for the army in Bosnia. The contributions to be assessed on the two parts of the empire are 99,991,768 florins.

The expenses of the civil administration of Bosnia and Herzegovina for 1888 are estimated at 7,089,809 florins, including the following items: public highways, 289,500 florins; worship, 162,508 florins; education, 91,889 florins; military forces, 251,034 florins; gendarmerie, 1,114,475 florins. The receipts are estimated at 7,217,819 florins, of which the tithes produce 2,250,000 florins; the income-tax, 600,000 florins; sheep-tax, 247,000 florins; customs, 702,000 florins; tobacco-tax, 1,896,000 florins; salt, 867,185 florins; octroi, 43,000 florins; and stamps, 300,000 florins.

The estimates communicated to the Delegations for 1884 call for 4,388,110 florins for foreign affairs, 102,413,639 florins for the army, including 6,876,005 florins of extraordinary expenditure, 9,470,977 florins for the navy, 174,400 and 125,747 florins respectively for the financial administration and control, and 1,978,450 florins for pensions. The total expenditures are estimated at 115,170,880 florins, the net surplus of the customs applicable to the common expenses at 17,633,570 florins, and the contributions of the two states at 98,107,799 florins. For the army of occupation in Bosnia and Herzegovina, 7,307,000 florins are asked. The cost of the civil administration of the occupied provinces is estimated at 7,856,267 florins, and the revenue from the provinces at 7,412,615 florins.

The Austrian Government is very tardy in publishing the accounts of actual receipts and expenditures. The budget estimates in recent years show invariably a deficit, averaging since 1876 some 37,500,000 florins a year. The estimated revenue for 1882 is 448,155,798 florins; expenditures, 485,720,951 florins. The principal heads of revenue are as follow:

SOURCES OF REVENUE.	Florins.
Direct taxes	92,970,000
Customs duties	29,820,584
Salt monopoly	19,566,000
Tobacco monopoly	63,947,200
Stamps	16,880,000
Judicial fees	82,000,000
State lottery	20,222,000
Kraise duties	88,167,000
State domains and railways	19,884,110
Post and telegraphs	23,078,000
Miscellaneous receipts	41,628,899
Total revenue of 1882	448,155,798

The following are the estimated expenditures of the several departments:

BRANCHES OF EXPENDITURE.	Florins.
Imperial household	4,650,000
Imperial Cabinet Chancery	70,295
Belohorath	1,482,693
Council of Ministers	1,043,310
Ministry of the Interior	17,580,765
National Defense	8,991,700
Public Education and Worship	17,782,835
Agriculture	11,519,408

BRANCHES OF EXPENDITURE.	Florins.
Ministry of Finance	104,396,814
Justice	20,745,385
Commerce	46,084,264
Board of Control	155,000
Interest on public debt	128,425,048
Pensions and grants	23,911,950
Cisleithan portion of common expenditure	99,946,690
Total expenditure of 1882	485,720,951

The Hungarian budgets from 1877 to 1882 show an average annual deficit of nearly 23,000,000 florins. The estimated revenue for 1882 was as follows:

SOURCES OF REVENUE.	Florins.
Direct taxes	88,690,000
Indirect taxes and monopolies	118,137,261
State domains, mines, and railways	26,187,116
Post, telegraphs, etc.	81,280,649
Miscellaneous receipts	37,782,188
Total revenue of 1882	301,967,314

The following were the estimated expenditures under the principal heads:

BRANCHES OF EXPENDITURE.	Florins.
Royal household	4,650,000
Royal Cabinet Chancery	70,295
Diet of the kingdom	1,206,018
Ministry "ad latus"	54,246
Ministry of Finance	104,396,814
the Interior	8,005,295
War	6,812,900
Education and Worship	4,802,547
Justice	10,159,898
Public Works	23,248,748
Agriculture and Commerce	8,628,913
Public debt and pensions	61,913,065
Guaranteed interest to private railways	10,900,000
Transleithan portion of the common expenditure of the empire	63,892,174
Miscellaneous expenses	65,881,025
Total expenditure of 1882	323,225,311

The ordinary expenses for 1883 were estimated at 288,800,000 florins, the ordinary revenues at 280,700,000 florins. The budget for 1884 places the ordinary expenditures at 298,200,000 florins, and the revenues at 295,500,000 florins; the total expenditures at 329,200,000 florins, and the total revenues at 308,900,000 florins.

Public Debt.—The public debt of the Austrian Empire was already large at the end of the Napoleonic wars. After 1848 it increased again rapidly from 1,250,000,000 florins to 3,000,000,000 florins in 1868. The war of 1866 added 300,000,000 of new loans, which were offset by the amount of the Lombardo-Venetian debt assumed by the kingdom of Italy. At the separation of Austria and Hungary an agreement was made, in May, 1868, renewed with certain modifications in 1877, whereby 70 per cent. of the total charges of the debt fell upon Austria and 30 per cent. upon Hungary. Since 1868 the two kingdoms have kept their finances separate. The deficits in Hungary constantly recurring since 1867, have been funded in a special debt, amounting in 1881 to the enormous sum of 1,045,319,600 florins. Austria has a large amount of floating liabilities arising from the same cause, given in a return for Jan. 1, 1882, as 411,998,744 florins, represented by a depreciated paper currency amounting to 320,484,947 florins, and interest-bearing treasury notes amounting to 91,563,797 florins, into

which form the later deficits were converted. The debt of the whole empire and of the Austrian monarchy, on the 1st of July, 1882, was 3,280,055,699 florins, of which the consolidated debt, bearing interest, represents 3,038,116,776 florins; non-interest-bearing, 115,756,604 florins; floating liabilities, 112,133,618 florins; and annuities, 13,998,701 florins. The total annual charge of the Austrian and common debts amounted in 1882 to 158,865,020 florins, of which the share borne by Hungary was 30,817,753 florins.

An operation for the conversion of the Hungarian debt was begun in 1881, in which year 160,000,000 florins of 6 per cent. gold bonds were redeemed by the issue of a 4 per cent. loan which was taken at a fixed price of 77½. The operation was suspended on account of the monetary crisis, and resumed again in 1883, when 300,000,000 florins were converted on slightly less favorable terms than before.

Tariff.—By agreement between the Austrian and Hungarian governments an increase in the tariff on petroleum, coffee, and tea was adopted as a means of reducing the chronic deficits in both countries. These enhanced duties, which fall with excessive severity on the laboring classes, went into operation in 1882. The import duty on petroleum was increased from 3½ to 10 florins per metric quintal. In addition to this an excise duty on refined petroleum of 6½ florins per 100 kilos was imposed by the Hungarian Government. The increased revenue in both halves of the empire from the new petroleum duty is calculated at 6,000,000 florins. The duty on coffee is increased from 24 to 40 florins per metric quintal, and on tea from 50 to 100 florins, from which changes an increased yield of 6,500,000 florins is expected.

Taxes.—A bill for the amendment of the income-tax, carried through by the Austrian Government, forms part of a plan for the reform of the whole system of direct taxation. The revision of the land and house taxes had already been accomplished. The new income-taxes are much simpler than the former system, which even the officials had difficulty in understanding in all its details. A progressive scale is established for incomes derived from trades and professions. Besides the other taxes on special kinds of income, every one receiving more than 700 florins a year of net income pays a personal income-tax calculated on a progressive scale. The changes are expected to augment the revenues, which the chronic deficits in the budget render necessary in Austria as well as in Hungary. In both halves of the empire the indirect taxes, consisting of stamps, fees, and imposts on articles of consumption, have been pushed to the extreme limit, with the exception, perhaps, of the sugar and spirit taxes. The income-tax in Hungary is higher than in almost any other country, being 12 per cent. on incomes from stocks and bonds.* The revision of the

Austrian system of taxes, the fourth within eighteen years, turns to this source which is already so fully utilized in the sister kingdom. The new land-tax is apportioned among the different provinces, and is assessed at 37,500,000 florins for fifteen years from 1881. The new personal income-tax is intended to replace all other methods of extraordinary or supplementary taxation. The rate is variable, and is fixed in the budget annually, according to the requirements of the Government. Incomes from enterprises which are required to furnish an official exhibit of their finances, and which are taxed at their source, are not subject to the personal income-tax. This variable extraordinary tax is supplementary to the scheme of the ordinary direct taxes, which covers systematically the five classes of objects approved by modern national economists, viz., land, houses, income from investments, trades, and salaries. The land-taxes are copied after the Prussian system. The cadastral survey and valuation, begun in 1869, was completed in 1881, at a cost of 20,000,000 florins. The yield of the land-tax is not greater than before. The house-tax is assessed on town property according to its renting value, and upon rural dwellings according to the number of rooms they contain. Mud and thatch cabins pay 75 kreutzers (37½ cents), houses with a single room 1 florin 50 kreutzers (75 cents), with two rooms 1 florin 70 kreutzers, up to villas and castles with forty rooms, which pay 220 florins (\$110) per annum, and 5 florins more for each additional room. This class-tax on dwellings is higher, and the progression somewhat steeper than under the old law. The new income-tax affects all incomes from invested capital which are not taxed under other heads, or expressly exempted from taxation by special laws, as are the interest on deposits in the postal savings-banks, and the revenues of charitable institutions, of public schools, and incomes not exceeding 300 florins. The law requires every one to give any desired information respecting his own income or that of another. The tax is 5 per cent., except on dividends derived from corporations, which pay 10 per cent. Industrial and commercial concerns are taxed according to their mean profits, beginning with 8 per cent. on 1,500 florins, and ascending to 10 per cent. on over 50,000 florins annual profit. The tax on earnings does not touch incomes below 300 florins. Up to 500 florins the rate is 0·2 per cent., ascending to 10 per cent. for salaries or professional earnings exceeding 5,000 florins.

Army and Navy.—The total war strength of the Austro-Hungarian army in the beginning of 1883 was about 1,250,000 men, including 245,000 Austrian Landwehr and 205,000 Hungarian Honveds. The standing army is under the control of the common Minister of War, while the militia is looked after by the Ministers of National Defense in the two kingdoms. The system of army organization agreed to by the two states and embodied in the law

* It is exceeded only in Italy, where incomes from funded securities pay 13·8 per cent.

of Dec. 5, 1868, is that of universal liability to arms, on the model of the German army. The term of service is three years in the standing army and seven years in the reserve, with a liability to serve two years more in the Landwehr. The reorganization of the army, begun in 1868, introduces the territorial system, dividing the empire into fifteen *corps d'armée* districts, subdivided into recruiting precincts. The 102 regiments of infantry, of four battalions, will each be stationed in the district from which it is recruited. The standing army numbered in the beginning of 1869 251,455 men on the peace footing and 779,597 including the reserves. The active army was made up as follows: infantry, 144,788 men; yagers, 16,186; cavalry, 42,271; field-artillery, 20,228; fortress artillery, 7,110; engineers, 5,296; pioneers, 2,672; staff and departmental services, 13,009; total, 251,455.

The Austro-Hungarian navy consisted, in 1862, of 18 iron-clad war-vessels, 37 steamers, chiefly small and constructed for coast-defense, 6 sailing-vessels, and 12 torpedo-boats. Of the armored vessels, ten are sea-going cruisers. The largest is the *Custoza*, a broadside ship of 7,060 tons, covered with 9½-inch plates, and armed with eight 18-ton Krupp guns. Of more modern type is the *Tegethoff*, of 7,390 tons, armored with steel 18 inches thick, with six 25-ton Krupp guns ranged broadside and in a turret. The *Erzherzog Albrecht* has 8½ inch plates and eight 18-ton Krupp guns. The navy was manned in July, 1862, by 6,270 officers and men, who can be doubled in the event of war. The navy is recruited by a levy on the seafaring population, subject to the same term of service as in the army, supplemented by enlistments. Austria has a strongly fortified naval harbor at Pola, which has been enlarged so as to be enabled to contain the entire fleet, and another naval port at Trieste, where the arsenals are situated.

Foreign Relations.—The situation of Austria-Hungary in its relations to foreign powers and the peace of Europe, though more difficult than that of any other country, is becoming more secure through the strengthening of the league of peace of which the German Chancellor is the author. The dangerous feelings which were rife in both Russia and Italy in the preceding year were less noticeable in 1868. The bond between the Governments of Austria and Italy seems to grow more acceptable to the Italian people, although a large section do not yet give up the idea that there are still scores to settle with their old enemy. The Irredentist demonstrations continued in the early part of the year, but subsided later. The Russian strategic railroads and rumored massing of troops on the frontier created great alarm in the beginning of the year, but the visit of the Russian minister, M. de Giers, at Vienna, and the manifestations of pacific intentions for the present on the part of the Czar tranquillized this feeling. The source of the danger, however, the situa-

tion of the south Slav peoples, became still more evident in 1868. The King of Servia, by becoming the *protégé* of Austria, effectually alienated his subjects, who after his return from a visit to Vienna, in August, broke out in open revolution. The pretender, Karageorgevich, fortified by Russian support and a matrimonial alliance with the Prince of Montenegro, hovered on the borders, ready to seize the throne. The occupied provinces remained tranquil during the year. The refugees nearly all returned from Montenegro. In the autumn the recruiting proceeded without objection. The difficulties with the Roumanian Government were not decided at the Danubian conference in a manner satisfactory to Roumania, but negotiations begun at Vienna with M. Bratiano in the fall promise to remove some of the causes of jealousy. (See DANUBE, EUROPEAN COMMISSION OF TRF.) The Roumanian Minister apologized for his hostile declarations of the preceding year. A boundary commission began the adjustment of certain disputed points of the frontier line between Hungary and Roumania. One of the occasional quarrels between the frontier guards on both sides of the line created a sensation in October, until it was known that the participants were alone responsible. The Hungarian Government was intrusted with the duty of removing the obstacles to navigation at the Iron Gate in the Danube.

Still more important to Austria than the arrangement of the affairs of the Danube, was the decision arrived at by the *Conférence à quatre* and arranged with the Turkish Government regarding the speedy completion of the Turkish lines of railroad to connect with the Austro-Hungarian system.

The Danube and Turkish Railways.—In the eighteenth century, and down to the middle of the nineteenth, Austria enjoyed a commercial primacy in Turkey which was originally won by her successful wars against the Ottomans, and which her geographical position enabled her to maintain. The political ascendancy in the lands of the divided Ottoman Empire has since been borne away by Russia and the Western powers, and in the commercial arrangements subsequently entered into Austria has seen her geographical advantages neutralized and the trade pass into the hands of the more enterprising merchants of England, France, and Belgium. This Levantine trade is, however, of vital importance to Austria and Hungary, unfavorably situated as they are with regard to the ocean commerce. By the Paris Treaty of 1856, Austria was compelled to share the control over the navigation of the Danube with France, Great Britain, the German states, Russia, Italy, and Turkey. The *acte public* of 1865 took away the remaining privileges which the Commission of Riverain States secured to Austria, and the Pontus conference of 1871 confirmed the prolongation of the European commission till April 24, 1868. The Treaty of Berlin in 1878 extended the jurisdic-

tion of the commission up to the Iron Gate, gave Roumania a voice which it has used against Austria, and delivered over to Russia, with the Kilia arm and the Stari-Stamboul mouth, the possible military command of the mouth of the Danube and control of its commerce. The deepening of the mouth of the Danube by the European commission was in reality detrimental to Austrian commercial interests. The stoppage of navigation during the winter months, the shoal and shifting channel in the wide stretch between Pressburg and Gönyö, and the rapids of the Iron Gate, deprive the Danube of value as an outlet for Austrian commerce. Before the improvement of the mouth, Austrian merchants monopolized the markets of the lower valley. Since British and French vessels are enabled to ascend the river, the Austrians have been driven step by step from this profitable field. In the sea-traffic Austria has lost ground in the same proportion. The overland exports to Turkey, including Servia and Roumania, increased only 16,000,000 florins in the sixteen years from 1864 to 1880. Of the imports of all Turkish ports in the ten years ending with 1872, England furnished 48 per cent., France 15 per cent., Germany $7\frac{1}{2}$ per cent., and Austria not 7 per cent. In the ten years between 1867 and 1877 the trade with Turkey showed a rapid decline. In the former year 18·3 per cent. of the import, and 22·1 per cent. of the export trade of the Austrian Empire was with Turkey; but in 1876 the proportions were 11·6 and 18 per cent. respectively, while the transit trade declined 80 per cent. The Austrian tonnage on the lower Danube declined from 86,000 in 1879 to 50,000 in 1881, while the British increased from 136,000 to 332,000. Of the tonnage which passed through the Sulina mouth in 1872, 30 per cent. was British and 11 per cent. Austrian; while in 1881, 63 per cent. was British and 6 per cent. Austrian.

The long-projected railroad connection with Turkey was expected to give Austria the opportunity to regain the position which was lost through the errors of her diplomatists and the incapacity of her merchants. In 1869, Baron Hirsch, the famous Austrian railroad financier, undertook to construct for the Turkish Government a line of railroad which should extend through the length of Turkey and connect under the most favorable conditions with the Austrian net-work. The concessions provided for a railroad from Constantinople *via* Adrianople and Philippopolis, through Bosnia to the Save, where it would connect with the Southern railroad of Austria. Branch roads were to connect the trunk-line with Salonica, Dedesagatch, and Shumla. The Constantinople end was built to beyond Philippopolis, the Salonica branch constructed, and the Novi-Banjaluka section finished, by 1872. A convention was concluded for the continuation of the east end from Bellova to Sophia and Nish, and the extension of the Salonica

branch from Uskub to meet the Bulgarian section at Mitrovitza, which it was intended to continue from Nish by way of Mitrovitza, Novi-Bazar, Serajevo, Travnik, Banjaluka, and Novi, to join the Austrian railroad at Agram. Baron Hirsch finished the Salonica road up to Mitrovitza, and constructed the Bulgarian branch to Tirnova. British intrigues and the rival interests of the Austrian and Hungarian states prevented the work from being carried any farther. The portions thus far completed opened up the whole interior of the Balkan Peninsula to British commerce, while Austria-Hungary derived no benefit from them. When the Porte showed an inclination to complete the connection with the Austrian railroads, it was persuaded to divert the line for supposed strategical reasons, and adopt the project of a difficult mountain railway from Sophia to Uskub. The Hungarians were strongly opposed to the Hirsch project, desiring that the connection with the Continental system should be through Hungary, and the Government went so far as to make surveys for a direct line from Pesh through Semlin and Belgrade to Nish. The territorial changes consequent upon the Russo-Turkish War increased the divided interests and strategical questions. The Berlin Congress, instead of deciding the question of the railroads, left it in an almost hopeless tangle by referring it to the *Conférence à quatre*, making it depend upon the mutual agreement of Austria-Hungary, the Porte, Servia, and Bulgaria. The Austro-Servian railroad convention was concluded as early as April 9, 1880. In this, Servia bound itself to construct within three years a railroad connecting with the Pesh-Semlin line and running from the Hungarian boundary near Belgrade up the Marava valley to Nish, and there dividing so as to connect with the Turkish railroads by two branches, one running to the Bulgarian boundary toward Bellova, where it would join the Constantinople line, and the other to the Turkish boundary to meet an extension of the Salonica-Mitrovitza railroad. The work was not completed at the term agreed upon, June 3, 1883, nor is it yet decided where the junctions with the Turkish and Bulgarian railroads are to be. The *Conférence à quatre*, at its sittings in 1881 and 1882, debated fruitlessly the questions of the international postal and telegraph services, tariff regulations, etc. A note communicated to the Turkish Government by the Austrian ambassador in the early part of 1883, complains of the delay in carrying out the decisions of the *Conférence à quatre*, and making the extensions to connect with the Servian and Bulgarian roads. It declared that the Porte had not yet determined the route by which the Yamboli line was to reach the Bulgarian railroad at Shumla, and neither accepted nor rejected the Servian proposal of the Vranja route for the connection of the Salonica-Uskub road with the Servian system. The

alternative is the Pristina route, by which the continuation already constructed to Mitrovitza would be utilized. The Austrians were desirous that the connection with the Salonica road should be taken in hand first, instead of the extension of the Yamboli branch into Bulgaria, which latter would serve Roumanian and Russian interests and promote British rather than Austrian commerce. The passage of the railroads through Hungary, Servia, and Bulgaria, instead of directly from Austria proper into Turkey, deprived them of many of the expected advantages to Austrian commerce and industry, while favoring the rival Hungarian interests. The protracted discussions of the *Conférence à quatre* led at last to the adoption of a railroad convention which was signed May 9, 1883. The route agreed upon for the line which will connect Vienna with Constantinople, passes through Semlin, Belgrade, Nish, Pirot, Caribrod, Sophia, Bakereh, and Bellova, to Sarembej, the present terminus of the railroad from Constantinople. The road from Salonica is to join the Servian railroad from Belgrade to Vranja, by means of a railroad to be constructed from the latter place to a point on the Salonica railroad in the neighborhood of Pristina, or wherever the surveys indicate the most favorable route, the point of junction to be settled upon by the Porte within a year. The 15th of October, 1886, is set as the term at which both lines must be completed. The gauge is to be the same as that of the Austrian railroads, the signal system and other modes of operation are to follow those of Austria, and in the customs arrangements every facility is given to commerce and travel. The tariffs per kilometre are to be identical in the countries through which the roads pass. At least one express daily is to run in each direction between Vienna and Pesh and Constantinople, and Vienna and Pesh and Salonica, at a speed of at least 35 kilometres (22 miles) an hour.

Austria.—Austria proper, or Cisleithania, has been governed since the recognition of Hungarian independence by a twofold Legislature, a central body, called the Reichsrath, and local assemblies, or Provincial Diets, for the individual provinces. The Reichsrath consists of an upper house, or House of Lords, and a lower house, or House of Deputies. The House of Lords is composed of the princes of the blood royal, 14 in number in 1882; the territorial nobility, numbering 53; the archbishops (10) and bishops of princely rank (7); and life-members appointed by the Emperor for distinguished merit and ability, in number 105. The *Abgeordnetenhaus*, or House of Deputies, consists, under the electoral law of 1873, of 358 members elected by four different constituencies: 1, the people of the rural districts; 2, the people of the towns; 3, the chambers of commerce in the large towns; 4, the large landed proprietors. The franchise in the popular urban constituencies was extended by a

law enacted in 1882 to all male persons paying five florins in direct taxes. The Provincial Diets are composed as follows: 1, the archbishops and bishops of the Roman Catholic and Oriental Greek Churches and the chancellors of the universities; 2, representatives of the landed aristocracy, elected by all proprietors paying taxes to the amount of 100 florins; 3, representatives of towns, elected by all the burgeses; 4, representatives of chambers of commerce and trade-guilds; 5, representatives of rural communes elected indirectly through electoral colleges. The provinces are seventeen in number: Lower Austria, Upper Austria, Salzburg, Styria, Tyrol, Vorarlberg, Bohemia, Dalmatia, Galicia, Carinthia, Carniola, Bukovina, Moravia, Silesia, Gorizia, Istria, and Trieste.

The Reichsrath has power to legislate on matters of customs, trade and commerce, banking, posta, telegraphs, and railroads, subject to royal approval, to scrutinize the public accounts and discuss all bills of taxation and expenditure, and to ratify all legislation relating to military service. Members of both houses have the right of initiative. The presiding officers in both bodies are nominated by the Emperor. The Reichsrath must be convened annually, and, in case of dissolution, new elections must take place within six months. The Provincial Diets legislate on matters of local administration and taxation, particularly agrarian regulations, public works, the church, schools, and public charity.

The Cabinet is composed as follows: President of the Council and Minister of the Interior, Count Eduard Taaffe, born in 1833, who held the same portfolio in a former ministry, 1867-'70, and was appointed chief of the present Cabinet Aug. 19, 1879; Minister of Public Instruction and Ecclesiastical Affairs, Baron S. Conrad D'Eybesfeld, appointed Feb. 17, 1880; Minister of Finance, Dr. J. Dunajewski, appointed June 26, 1880; Minister of Agriculture, Count Julius Falkenhayn, appointed Aug. 19, 1879; Minister of Commerce and National Economy, Baron F. Pino von Friedenthal, appointed Jan. 14, 1881; Minister of National Defense, Maj.-Gen. Count S. von Welsersheimb, appointed June 25, 1880; Minister of Justice, A. Prazak, appointed Jan. 14, 1881; Minister without Portfolio, F. Ziemiakowski, appointed Aug. 12, 1879.

Political Chronicle.—The Czechs, whose position was strengthened by the Bohemian elections of 1883, continued to press their victory over the German party, which showed a still more bitter and irreconcilable spirit. Provision was made for the establishment of a Czechish medical faculty in the University of Prague. Although the Czechs and Slovenes elected representatives to the Reichsrath who for four years have dictated radical changes in the laws of the empire for the benefit of their races, yet the provincial legislation has remained in the hands of the old German

majority. Finally, the ministry gave heed to the frequent memorials from Bohemia and Carniola, and ordered new elections for the Diets of those provinces, in which an overwhelming majority of Autonomistic candidates were returned. In Galicia the Ruthenians have the same complaints to make against the Poles which the latter and the other Slavs formerly made against the Germans. To them alone of all the Slav races the triumph of the federalistic principle signifies the extirpation of their national characteristics. They are about equal in number with the Poles, but form the poorer and politically weaker class. They formerly voted with the German Centralistic party, and looked to it for protection, but, losing hope of relief from that quarter, are gradually abandoning their opposition, relying on the hope that the combination of parties which has saved from extinction all the other nationalities will not be so inconsistent as to help crush out theirs. In the elections of 1883 the Polish Federalistic party carried everything before them. A sign that the Germans will soon abandon their efforts to recover the dominant position which enabled them to impose German civilization upon the unwilling Slavs by political means, is seen in the growth of a German national spirit manifested in demands for the autonomy of the German communities of Austria which are in danger of being engulfed in the "Slavic deluge." Many of the Jews in Austria, who formerly counted themselves as Germans, have turned with the popular current, and adopted other nationalities. The Germans also begin to show the same facility as in other countries to merge their nationality, now that it secures them no advantage, in that of alien races.

As the Saxons of Transylvania complain of Magyar oppression, the German party in Bohemia anticipate similar grievances, and have broached the subject of the division of the province into separate German and Czechish administrative districts. These incidents of the race struggle are but superficial manifestations. The preponderance of German thought and the spread of German influence through commercial, political, and intellectual channels still continues in Austrian lands and extends through southeastern Europe, although Magyar and Slav politicians attempt to revive the influence of French ideas, and during the year gave expression to this sentiment in frequent newspaper articles and a number of political manifestoes. The combination of Czechs, Poles, and Conservatives, which has carried through the federalistic policy, obtained in 1883 for the first time a majority in the Austrian Delegation, which, according to the usual custom, is not elected by the whole House, but by the deputations of the several provinces, to each of which a certain number of seats in the Delegation are allotted.

Socialism.—Austria has hitherto prided itself on its freedom from socialistic agitation. But

for a year or two past it has seen evidences of a wide-spread socialistic propaganda, and has been startled by eccentric crimes committed by revolutionary desperadoes, by riotous demonstrations in the streets of Vienna, and by murderous encounters between the police and socialists. In November, 1882, the breaking up by the police of a shoemakers' trades-union was the occasion of a riot in Vienna, in which the cavalry were called out, and charged on the mob. The following month there was a monster trial of socialists in Prague, which resulted in the conviction of forty-five persons. Another band, twenty-nine in number, were brought to trial at Vienna in March, 1883. To some of these a singular crime was brought home. They had murdered and robbed a shoemaker in July, 1882, in order to obtain money to spread the inflammatory teachings of Johann Most's "Freiheit." All the prisoners except the two implicated in the crime were acquitted, because there is no law against socialism in Austria, and convictions can only be pronounced for high treason or disturbance of the public peace. A general strike of the bakers in Vienna caused some excitement and much inconvenience, until the Government came to the relief of the public and crushed the strike by supplying the city with bread made by the army bakers. On December 15th a commissary of police who had attended socialistic gatherings, in conformity with a law requiring all meetings, however private, to be held under police supervision, was murdered in a suburb of Vienna.

The socialistic ferment, which has penetrated into Austria, has stimulated politicians to propose remedial measures. The Government introduced into the Reichsrath, in the session which opened Dec. 5, 1882, a trade-regulation act, an employers' liability act, and a project for accident insurance. Even the Left sacrificed the principle of non-interference so far as to accept the trade act with its provisions for compulsory benefit associations. Another law intended to counteract the unrestricted supremacy of capital, which was passed, imposes limitations on joint-stock companies. The Liberals, who here as in Germany have been accused of indifference to the welfare of the humble classes, brought forward a scheme which embraced industrial, agrarian, and poor-law reforms. They proposed to establish sick-funds, accident insurance, and superannuation pensions for industrial operatives at the sole cost of employers. The poor laws they wished to amend so as to enlarge the districts or facilitate the acquirement of a domicile, as now relief to the sick or hungry is often refused on account of non-residence, and in some cases persons are sent away from cities where there are hospitals to carry contagious diseases into their rural parishes. The agrarian question is one of great moment and difficulty in Austria, but is not likely to find the same reconstructive disposition on the part of the ruling factions as the

question between capital and labor, for it touches the interests and the prejudices of the land-owners. The class of cottagers who are half peasants and half laborers, and who have sunk into abject proletarianism, is increasing. When their useless parcels of ground are ever given up, they do not pass into the hands of the farming class, which is too poor to acquire them, but are added to the estates of great land-owners or the country-seats of city residents. The effect of overgrown estates, a numerous dependent proletariat, and taxes which bear heavily upon the small farmers, who are already handicapped by an uncertain climate and a dearth of credit facilities, is to perpetuate negligent methods and a stationary routine which leave Austria ill prepared to stand the stress of American competition.

School Laws.—An amendment of the school law was carried in the Reichsrath, which makes some alterations in the system of elementary instruction of a reactionary character, to meet the views of the clerical and feudalistic elements in the majority of the House of Deputies. The number of days of obligatory attendance can be greatly reduced at the request of a commune. Religious instruction is made a more important branch, and is to be imparted in the faith of the majority of a commune. The Poles, who, because they hold the balance of power in the Reichsrath, can usually impose their will on the Government, secured the exemption of Galicia from the provisions of the new school ordinance.

Hungary.—The kingdom of Hungary possesses an ancient constitution, consisting of fundamental statutes enacted at various dates since the foundation of the kingdom in the ninth century. The Constitution was abrogated after the rebellion of 1848, restored in 1860, and extended to its ancient limits in 1867, when the national independence of Hungary was finally re-established. The Hungarian Diet consists of an upper chamber, called the House of Magnates, and a lower, called the House of Representatives. The House of Magnates was composed in 1882 of 2 royal princes, 5 archbishops and bishops of the Roman Catholic and Greek Churches, 672 peers and dignitaries of Hungary and Transylvania, 5 regalists from Transylvania, and 2 deputies of Croatia—in all, 781 members. The House of Representatives, elected directly by all citizens who pay eight florins in direct taxes, consisted in 1882 of 384 deputies from Hungarian districts and towns, 75 from Transylvania, 84 delegates from Croatia, and 1 from Fiume.

The executive power is exercised by a responsible ministry, composed as follows: President of the Council, Koloman Tisza de Boros-Yenő, who has been chief minister since Feb. 25, 1877; Minister of Finance, Count Gyula Szapary, appointed Dec. 6, 1878; Minister of National Defense, Count Gedeon Raday, appointed Oct. 10, 1882; Minister *ad latus* to the King, Baron Bela d'Orczy, appointed Aug. 12, 1879;

Minister of the Interior, Koloman Tisza; Minister of Education and Public Worship, Dr. August de Trefort, appointed Feb. 26, 1877; Minister of Justice, Dr. Theodor Pauler, appointed Dec. 6, 1878; Minister of Public Works and Communications, Baron de Kemeny, appointed Oct. 14, 1882; Minister of Agriculture, Industry, and Commerce, Count Szechenyi, appointed Oct. 14, 1882; Minister for Croatia and Slavonia, Count de Bedekovich, appointed Feb. 26, 1877.

Political Chronicle.—One of the first acts of the Hungarian Parliament, which met in October, 1882, was to remove from the committee of education the elements that opposed making the Magyar tongue the national language of instruction. The chief contest was over the classical and scientific intermediate schools of Transylvania, and the educational supervision of the Evangelical Church in that province. The bill, elaborated in the committee, and carried March 17th by a large majority, prepares the way for the substitution of Hungarian for German in these schools, and Roumanian for the intermediate schools in which Roumanian is the language of instruction. It requires all candidates for teachers' positions in the intermediate schools of the monarchy to submit to a government examination conducted in the Magyar tongue. Three of the four years of preparatory study may be passed in foreign universities, but the final examination must be passed in a Hungarian university, and requires a literary training in the national language.

The Ritual Murder Case.—A criminal trial which was held in June shows that the antipathy against the Jews in eastern Europe, though springing from economical motives, contains an element of superstitious hatred known elsewhere only from the legends of the middle ages. In the village of Tisza-Eszlar, a Christian girl, named Esther Solymossy, suddenly disappeared in the spring of 1882. The rumor was started that the Hebrews of the village had murdered her to obtain the blood of a Christian virgin, which, according to the ancient fable, they mix in their Passover cakes. A malicious petty magistrate, Bary, who had charge of the preliminary examination, influenced or suborned a Jewish boy, named Moritz Scharf, to accuse Salomon Schwartz, and some other Jewish butchers, of cutting her throat, and a number of others, among them his own father, of being witnesses and accomplices in the crime. The girl had been sent to a neighboring village to purchase dye. The last that was seen of her was in the vicinity of the synagogue on her return. The Jews were in the temple that morning trying candidates for the office of butcher to the congregation. Moritz Scharf testified that he saw the murder through the key-hole of the entrance-door. Two women declared that they heard cries and sobs. On this evidence the accused were brought to trial. The body of a drowned girl was found in the river Theiss three months after Esther

Solymossy's disappearance. It was clad in her garments, and was recognized as her remains by her father and others; but her mother, pastor, school-teacher, and numerous acquaintances denied the identity. A commission of medical experts reported that it was the corpse of an older person than Esther, and of one not accustomed to hard labor. A second commission, composed of university professors, found that the marks of physical development did not indicate an age of more than fourteen years. The evidence of the body, the modification of the statements of neighbors who heard cries, and the confused and contradictory testimony of the Hebrew boy under cross-examination, would have abundantly exculpated the prisoners if additional suborned testimony had not strengthened the theory that the corpse was a spurious one placed in the river by members of the Jewish congregation to defeat the evidence against the accused. Two Jewish raftsmen confessed that they had been employed to convey the dead body and deposit it in the water where it was found. The public prosecutor, Szeffert, declared in taking the case that he did not believe in a ritual murder, and only took part in order to have the evidence sifted and the truth brought out. Beyond this the Government did not intervene in the proceedings. The prosecution was conducted by lawyers retained by anti-Semitic partisans. The trial was interrupted by exhibitions of popular passion, and an anti-Semitic outbreak was feared. The trial ended in the acquittal of the ten prisoners. The effect was eventually to confine the anti-Semitic movement in Hungary more within logical bounds. The excitement continued, however, for some time after the trial, and in various places in North Hungary outbursts of fanaticism occurred. At Tisza-Eszlar there were incendiary fires. At Presburg, riots, like those of the preceding year, required the services of the military to suppress. The Scharf family were mobbed out of Pesth, and their advocate, Dr. Eötvös, was the object of angry demonstrations at Nyiregyhaza. At Zala Egerszeg, in Western Hungary, serious riots, in which the neighboring peasantry took a prominent part, began Aug. 23d, and lasted several days. The garrison of the town were unable to preserve order or to prevent the mob from sacking the Jewish quarter. In a riot at Szegitvar, Sept. 2d, artisans broke into and wrecked the stores of Jewish shopkeepers, and were fired upon by the police, but not cowed until the arrival of troops.

The Hungarian Government maintained throughout the anti-Jewish agitation a firm attitude, and not only employed every means to quell disorder, but gave no countenance to the popular demands for the repeal of Jewish emancipation or any class legislation directed against the Jews. Yet Minister Tisza acknowledged that there was a Jewish question of an economical nature, and that the evils would not cease until the social causes

were removed. The public-houses throughout the country are kept by Jews. They combine with their trade that of the money-lender, and with other usurers, all of the Hebrew race, keep the peasantry in a condition of economical subjection. The Government brought in bills designed to abate the evils, one of which deprives wine and liquor sellers of legal remedies for the collection of debts for drink, and another is a usury law with severe penalties and elaborate safeguards.

The Croatian Troubles.—The Hungarians, who have observed with a feeling of indifference if not with sympathy the victories of the Czechs over the German Centralists, and the federalistic movement among the other Slav nationalities in Austria, were confronted in 1888 with a Slavic question of their own. The results of the Russian War, and the provisional occupation of Bosnia by Austria, were to arouse in Serbia the ambition of uniting the Serbic race into one kingdom; then, since Austria was not likely to relinquish the occupied provinces, to excite hopes in Montenegro of becoming the head of a great Serbic nation under the protection of Russia; and, next, of stirring with similar aspirations the petty nationality of the Croats. The Great Croatian idea looks to the creation of a third member of the Dual Monarchy, a South Slav monarchy with its capital at Agram. The Croats have certain grounds for considering themselves the fittest instrument for the mission of Austria among the South Slavs. Their fidelity and attachment to the Hapsburg dynasty are proverbial. They claim to have been of great assistance in rescuing the dynasty in the conflict with the rebel Magyars in 1848. Since then the Croats have progressed in intelligence and culture as much as or more than the Magyars. The development is in the direction which was given it under German control before their incorporation, sorely against their inclination but in obedience to the will of the monarch, in the kingdom of Hungary. They have not been treated with oppression by the Hungarian Government, but have been permitted to retain their old laws as to land, inheritance, and the election of magistrates. They are not fairly represented in the Hungarian House of Magnates, owing to the same electoral system which denies to the Germans their just quota of representatives in the Cisleithan legislative bodies. The Croatian deputies in the lower house have, however, exercised an influence on the Hungarian Government which is out of proportion to the importance of their province, because they have always voted with the ministry, and on several occasions when the opposition was strong their vote saved the Government from defeat. The incorporation of the Military Frontier, which operation was completed in 1882 and 1883, increased the importance of the province, and gave an impetus to the movement for the union of the districts inhabited by Servians and

Croats, in Dalmatia, Slavonia, Istria, Carniola, and Carinthia, with Croatia and the Military Frontier, to form a Croatian kingdom under the Austrian crown, to which Bosnia and Herzegovina could be added, with the expectation that the other Balkan lands inhabited by the Serbic race would gravitate toward this great state in the future permutations of the Eastern question. The Servians of Croatia and the Austrian provinces, who differ from the Croats, not in language or race, but in religion and political tendencies, were strongly opposed to the occupation of Bosnia. They sympathize with the idea of a Great Servia.

In August began a series of violent Croatian demonstrations in Agram and different parts of the country. The first act was the tearing down of the Hungarian arms from the door of the Finance Office in the capital. These escutcheons with bilingual inscriptions had recently been put up—an act which was suspected of being the commencement of a policy for the suppression of the Croatian language and institutions. Magyar inscriptions and signs were destroyed by rioters in all the towns. The military were called into requisition, and, in consequence, the disturbances became more violent. Some districts were placed under martial law. In Maria Bistrica, in a collision between gendarmes and Croat peasants, several rioters were killed. The Ban of Croatia, Count Prejacevich, who had not been a popular administrator, showed sympathy with the movement and declined to replace the Hungarian arms with the obnoxious Magyar inscription on the front of the government buildings. He was obliged to resign his office in consequence, and now received popular ovations as a great patriot. There were signs of the Slavic ferment in the neighboring Austrian provinces. In the beginning of the year Baron Jovanovich created an uproar in Dalmatia by ordering the official communications between civil servants to be made in German. By an act of the Reichsrath this order was subsequently rescinded. In Darenzo, where the Istrian Provincial Diet meets, a Croat deputy made an attempt to debate in his national tongue instead of in Italian, which is the official language. The Dalmatian deputies obtained the enactment by the Reichsrath of a law directing judicial proceedings in their province to be held in the Servian or Croatian dialects, instead of in Italian. The troubles in Croatia attained the magnitude of an insurrection. The Emperor did not nominate a Ban to succeed Count Prejacevich, but appointed a royal commissioner with extraordinary powers to restore civil order. The Minister for Croatia, Bedekovich, resigned his portfolio. Gen. Ram-

berg was selected for this service. In the Zagorien district, encounters took place between the military and the rioters, and the troops were repelled at Krapina, Töplitz, and Sopo. The commissioner issued a proclamation stating that the bilingual official notices would be continued, to demonstrate the fact that political questions were not to be settled by street riots. The escutcheons were replaced on the government buildings at Agram on the 7th of September, and on the following day occurred another riot. The economic distress of the people made them more susceptible to the enticements of agitators, and complicated the movement with socialistic and anti-Semitic demonstrations. The men at the head of the Imperial and Hungarian governments were not inclined to proceed to extremes, and the troops used great forbearance. The suspension of executions for the collection of taxes caused a partial subsidence of the agitation.

After Agram was tranquillized, an insurrection broke out in the Military Frontier, which, like the one in Zagorie, was of an agrarian nature. At Farkasevinez an anti-Magyar riot occurred on the 20th of September, and ten peasants were killed by the soldiery. Persons concerned in the riots at Agram were brought to trial and, September 30th, sentenced to short terms of imprisonment. At the meeting of the Hungarian House of Deputies on the 1st of October, the Croatian deputies refused to take part in the proceedings pending the settlement of the question of the escutcheons. They formulated the national demands, which embraced the restitution of the escutcheons with Croatian legends only, the recall of the royal commissioner and the appointment of a Ban, the establishment of constitutional government, the convocation of the Croatian Diet, and the immediate discussion of the compromise law under which Croatia was attached to Hungary. The Premier announced a policy of conciliation and of willingness to discuss and remedy any grievances. The complaints of unfair taxation were shown to be groundless as far as the Central Government was concerned, but not as regards the local authorities. Peculations of the magistrates of their own appointment aggravate the burden of taxes. All intentions of suppressing the language, nationality, or autonomic rights of Croatia were disclaimed. After a spirited debate, the Parliament approved the proposal of the ministry to replace the demolished escutcheons without any inscriptions, letting those remain which bore Croatian inscriptions. The royal arms were accordingly erected on the 16th of October, after the disturbances were over, without either Magyar or Croatian legends.

B

BAPTISTS. The "American Baptist Year-Book" for 1883 gives tables of statistics of the regular Baptists of the United States, of which the summary of the footings is as follows: Number of associations, 1,167; of churches, 26,981; of ordained ministers, 17,090; of members, 2,894,742; number of additions by baptism during 1882, 94,680; number of Sunday-schools, 15,188, with 180,606 officers and teachers and 1,065,195 pupils, and 18,804 baptisms in the Sunday-schools. Amount of benevolent contributions reported, \$5,219,396. Increase of members during the year, 58,720. The educational institutions of which the "Year-Book" gives reports include 8 theological seminaries, with 45 instructors and 451 students; 33 colleges and universities, with 291 instructors and 4,177 students; and 52 academic institutions and seminaries for young men and young women, with 391 instructors and 6,554 students.

The numerical summaries of the regular Baptists in other countries are as follow:

	Churches.	Ordained ministers.	Members.
North America (outside of the United States).....	809	565	99,477
South America (Brazil).....	8	4	325
Europe.....	3,108	2,247	343,240
Asia.....	650	323	58,410
Africa.....	87	38	6,689
Australasia.....	124	92	10,123
Total for the world.....	81,812	30,378	3,905,848

Whole number of associations, 1,263.

The number of other Baptist churches than the regular Baptists in the United States is as follows:

	Churches.	Ministers.	Members.
Anti-Mission Baptists.....	900	400	40,000
Church of God.....	400	250	30,000
Free-will Baptists.....	1,455	1,256	76,706
Seventh-day Baptists.....	87	108	3,606
Six-principle Baptists.....	29	17	2,075

Bible Convention.—The regular anniversary meetings of the Northern Baptist benevolent societies of the United States were preceded by a "Bible Convention," which was called in accordance with action taken by the several societies at their anniversaries in 1882, "to consider and decide what the Baptist denomination ought to do in reference to translations, versions, and the circulation of the Bible in all lands, and through what organizations this object shall be effected." The convention met at Saratoga Springs, N. Y., May 22d. The Hon. James L. Howard, of Connecticut, presided. Resolutions were adopted, as follow:

Whereas, In the year 1883, the Baptists of America resolved to give to the heathen the pure Word of God in their own languages, and to furnish their missionaries with all the means in their power to make their

translations as exact a representation of the mind of the Holy Spirit as may be possible; and

Whereas, Their missionary translators were instructed to endeavor by earnest prayer and diligent study to ascertain the exact meaning of the original text, and to express that meaning as exactly as the nature of the language into which they translate the Bible will permit; therefore,

Resolved, 1. That this convention earnestly reaffirms these positions as sound and obligatory.

2. That as these principles are defined, it is the duty of American Baptists to circulate versions made upon these principles in all languages, as far as such versions can be secured.

3. That as there are differences of opinion in our denomination touching the several versions now existing in English, on the score of fidelity, it is the right of every Baptist to use that version which best commends its faithfulness to his conscience in the sight of God.

4. That while, in the judgment of this convention, the work of revision is not yet completed, whatever organization or organizations shall be designated for the prosecution of home Bible work among American Baptists should now circulate the commonly received version; the new Revised Revision with the corrections of the American revisers incorporated in the text, and the translation of the American Bible Union, according to demand, and that all moneys especially designated for the circulation of either of these should be faithfully appropriated in keeping with the wish of the donor.

Furthermore, the convention expressed its judgment that the Bible work of the Baptists should be done by the two existing societies, the foreign work by the American Baptist Missionary Union, and the domestic work by the American Baptist Publication Society; that the Missionary Union "should more fully recognize the necessity of accurate translation and wide distribution of the Word of God in foreign lands," and should use every effort to enlarge its means; that the Publication Society should establish a new department, to be designated as the Bible Department, with a special secretary, to be charged with the duty of collecting and expending funds for home Bible work:

That as a guarantee that all the chief views current in our denomination shall be represented in the conduct of our home Bible work, and as a provision for a settlement of the questions which have arisen with regard to the administration of that work, the American and Foreign Bible Societies be requested to name three persons to be voted for as managers of the Publication Society, and that upon the election of these persons as such managers, the American and Foreign Bible Societies be requested, in the interest of Baptist unity, to dissolve and thenceforth cease to exist as a separate organization;

and that the Publication Society should establish such relations with the American Baptist Home Mission Society that the missionaries of the latter body may co-operate with it in the circulation of the Bible.

The American and Foreign Bible Society, at its annual meeting, May 24th, determined to accept the advice of the convention, and to make arrangements to disband as a separate

organization, and turn over its work to the Publication Society and the Missionary Union. The other societies concerned in the proposed scheme also resolved to accept the functions which its execution would impose upon them.

American Baptist Missionary Union.—The annual meeting of the American Baptist Missionary Union was held at Saratoga Springs, N. Y., May 24th. The Rev. George Dana Boardman, D. D., presided. The receipts of the Union for the year had been \$327,800, and its expenditures \$316,410. The condition of the missions is exhibited in the following table:

MISSIONS.	Mission- aries.	Native preachers.	Church- es.	Baptized.	Members.
ASIATIC MISSIONS.

A newspaper statement had charged the treasurer of the society with taking advantage, in settlements with the missionaries, of the differences in exchange in the valuation of dollars and rupees at the expense of the missionaries and to the profit of the treasury. This charge was answered by the chairman of the committee of finance, who, after a special examination of the subject and of the treasurer's accounts, reported that "for twenty-three years previous to 1878 the changing of dollars into rupees favored the missionaries on the field by the appreciation of the rupee, while for three years afterward the Union gained by the depreciation of the value of the rupee. To remove all cause for dissatisfaction by the missionaries in 1879, the Union now changes its dollars into pounds sterling and then into rupees, so that the missionaries now receive the full amount of their salary of dollars in rupees. All of the gain during five years in the depreciation of the rupee is strictly accounted for by the treasurer's report." Resolutions were adopted expressing satisfaction with the statement, and "unqualified confidence" in the late treasurer.

American Baptist Home Mission Society.—The annual meeting of the American Baptist Home Mission Society was held May 25th. The Hon. James L. Howard presided. The total receipts of the society for the year had been \$283,944; the permanent and trust funds held by it amounted to \$497,535; and an indebtedness was returned of \$49,967. Six hundred and

seven missionaries had been employed, of whom 362 were laboring among American, 100 among foreign, and 37 among other populations; and they had supplied 1,762 churches and out-stations. The fourteen schools among the colored people and the Indians, and in Mexico, employed 112 teachers, and were attended by 2,718 students. Besides forty-four States and Territories in the United States, the society had prosecuted its work in British Columbia, Manitoba, and Mexico. Its work among Scandinavians was conducted in nine States and Territories, among French in six States, and among Germans in seventeen States and Territories; and missionaries had been appointed representing ten nationalities or people, viz., Americans, Germans, Swedes, Danes, Norwegians, French, Mexicans, Indians, negroes, and Chinese. The Indian University, in the Indian Territory, was in a flourishing condition, and was attended by 42 young men and 53 young women.

The Woman's Baptist Home Mission Society had received during the year \$22,000 in cash and \$4,524 in goods, and had disbursed \$22,348. It had employed 26 missionaries, 6 missionary teachers, and 10 Bible-women, who were laboring among the Indians, the freedmen, Scandinavians, Germans, and Mormons.

American Baptist Publication Society.—The anniversary of the American Baptist Publication Society was held May 28th. The receipts of the society for the year had been \$399,673 in the business department, and \$122,246 in the missionary department. Forty-five new publications had been issued, and 122,800 Bibles had been distributed.

Southern Baptist Convention.—The Southern Baptist Convention met at Waco, Texas, May 11th. The Rev. P. H. Mell was chosen president. The principal business of the meeting consisted in a review of the progress of the missionary and benevolent work of the Southern Baptist churches. The income of the Board of Missions for the year had been \$56,805, and the board had a balance of \$6,100 in its treasury. Reports were made of the condition of the several missions, as follow: The Mexican mission had 65 church-members, of whom 13 had been baptized during the year. Two missionaries, with three assistants, besides native helpers, were employed at eight stations. In Brazil, four missionaries, all foreign, were employed at the stations of Santa Barbara and Bahia, where were 50 church-members, and in which five persons had been baptized during the year. Three missions were sustained in China, employing 34 missionaries, and with them were connected 587 church-members. In Africa were seven missionaries, at five stations, with 100 church-members and 194 pupils in schools. The missions in Italy included ten stations, at which were 14 missionaries and evangelists, and with which were connected 220 members. Seven missionaries had been sent out by the board during the year.

The Home Mission Board reported that it employed 95 laborers, who had supplied 276 churches and stations and baptized 245 persons, had organized 55 Sunday-schools with 2,660 teachers and pupils, and had collected \$844 for missions, and \$2,000 for church-building purposes. The board had received co-operation in its work from the Baptist State organizations of Georgia, Mississippi, Louisiana, Arkansas, Florida, Texas, and Missouri. A favorable report was made of the Indian Muscogee mission. During the thirty years that the late principal missionary, the Rev. Dr. Buckner, labored in it, an average of one church was organized and one minister was ordained for every year, and 75 conversions took place annually. The number of members was now 2,600. The subscriptions in behalf of the theological seminary had been sufficient to pay its expenses during the past three years, and the institution had now a surplus. It had been attended by students from every Southern State except Maryland, and from other States and from Mexico.

German Baptist Conferences.—In the German Baptist conferences, six new churches were organized in 1882, making 168 in all connected with the conferences, with a membership of 80,442, against 28,956 in the previous year. The number of baptisms during the year was 2,967. The number of Sunday-schools had increased during four years from 178, with 691 teachers and 8,954 pupils, to 402, with 1,146 teachers and 8,954 pupils.

Baptist Convention in the Indian Territory.—A Baptist Convention, composed of the associations and churches of all the Indian nations settled in the Indian Territory, was organized in Tablequah, Cherokee Nation, in June. Representatives were present of the Cherokees, Creeks, and Seminoles, of the Plains Indians at the Wichita agency, and of other bodies, making in all seven Indian tribes, of three races and five languages, whose delegates participated in the proceedings. This organization was recognized and approved by the Choctaw and Chickasaw Association at its annual meeting in October.

Baptist Autumnal Conference.—The second Baptist Autumnal Conference was held in Boston, Mass., November 13th, 14th, and 15th. The Rev. Alvah Hovey, D. D., presided. The following topics were considered in papers read by appointed essayists and in general discussions: "Church Architecture" (Rev. C. J. Baldwin and Rev. J. R. Thomas); "The Social Element in Church Life and Church Work" (Rev. W. E. Hatcher, D. D.; Rev. J. B. Simmons, D. D.; Hon. J. M. S. Williams; J. C. Hiden, D. D.; and Rev. Mr. Rhoades); "The Sanitary Provisions of the Mosaic Code" (George H. Fox, M. D.); "Christianity and the Body" (President S. L. Caldwell, of Vassar College); "Christianity in Politics" (Rev. E. P. Gould, D. D.); "The Divorce Question" (Rev. H. S. Barrage, D. D.; Judge Buchanan, of New Jersey; President A. Owen, of Denison Uni-

versity); "Modern Biblical Criticism" (Rev. T. J. Conant, D. D.; Prof. Howard Osgood, D. D.; Prof. D. G. Lyon, Rev. J. A. Smith, D. D., and Prof. D. J. Hill); "The Coming Ministry" (President E. Dodge, of Madison University; Rev. J. C. Hiden, D. D., and Rev. P. S. Moxon); "Worldliness" (Rev. T. Edwin Brown, D. D.; Rev. H. M. King, D. D., and Rev. A. C. Dixon).

Convention of Liberal Baptists.—A convention of "Liberal" or "Open-Communion" Baptists, the call for which was signed by representative men of the Free-will Baptist Church, the Free Baptists of New Brunswick and of Nova Scotia, the Church of God, the General Baptists, and the Separate Baptists, met in Minneapolis, Minn., October 2d, with the declared object of promoting a more intimate acquaintance and a closer union among the different branches of the church in whose name it was held. The Rev. O. B. Cheney, of Maine, was chosen president of the convention. A paper which was read on the subject of "The Liberal Baptists of America," sketched the rise of the General Conference of the Free-will Baptists of New England, with which 78,000 members are now connected, and described other Free Baptist organizations, as follows:

In 1828 a movement, under Elder Stimson, began in Indiana. The people took the name of "General Baptists," and now have in the Western States not less than 13,000 members. About 1828 a few churches separated from the United Baptists and took the name of "Separate Baptists." Churches have been planted by them, and we now know of ten associations, with a membership of not less than 7,000 communicants. We also have Free Christian Baptists in Nova Scotia and the Free Baptists of New Brunswick. The people known as the "Church of God," organized in Pennsylvania in the year 1830, now embrace upward of 80,000 members, and sustain several newspapers and institutions of learning. If we give a summary, the showing is: Free Baptists, 78,000; Church of God, 80,000; Nova Scotia and New Brunswick, 14,000; General Baptists, 18,000; Free Baptists in North Carolina, 10,000; Separate Baptists, 7,000; Free Baptists in Western States, 5,000; total, 187,000.

A report from the business committee, which was adopted, opened with a declaration that "the several associations of churches of Jesus Christ in America, who hold the evangelical faith, practicing believers' baptism, and excluding no recognized Christian from the Lord's table, are *one* by the strongest ties, that of a common faith and spirit, unity of purpose, mutual respect, and paternal love, and hence should be one in formal fellowship and methods of co-operation." The action of the convention embodied recommendations that a year-book be published, representing all bodies of Liberal Baptists; that a quarterly publication, or magazine, be established; that there be co-operation in the support of foreign missions; that Liberal Baptist literature be circulated; that the convention be perpetuated by the election of an executive committee authorized to represent the Liberal Baptist bodies and to call another convention; that the sev-

eral bodies be urged to correspond with one another; and that the cause of education be given every possible encouragement. An executive committee was appointed, of which the Rev. G. H. Ball, of New York, is chairman.

Free-will Baptist Church.—The twenty-fifth General Conference of the Free-will Baptist Church was held in Minneapolis, Minn., in October. The Rev. Ransom Dunn, D. D., was chosen moderator. The most important business transacted was the discussion of the resolutions of the General Convention of the Open-Communion Baptists, which were approved, and, so far as they affect the Free-will Baptist Church, adopted. A new charter and constitution for the Foreign Missionary Society were adopted, by the operation of which the scope and power of that organization, and its capacity to hold property, are expected to be greatly increased. Among the important changes made in the constitution are the incorporation of provisions for the representation of the several denominations or organizations of open-union Baptists in the Executive Board of the society, and for the admission of women to full membership and on equal terms with men. The society began the year with a deficiency of several thousand dollars, but was able to show a surplus above all expenditures on closing its accounts. The mission is in Orissa and Bengal, India, and returned 551 communicants. Twenty members had been added by baptism during the year. The whole number of pupils in the schools was 3,089; of whom 347 were Christians, 1,043 Hindoos, 261 Moslems, and 1,488 Santals. Measures were taken for the organization of a church extension department of the Home Mission Society. A committee was appointed to draft a course of study for general use among ministers, and to encourage the organization of ministers' conferences for discipline and study. The conference recommended that a pastor or stated supply of a church, whose membership is elsewhere, be amenable to the church with which he is laboring, as if he were a member of it. Provision was made for the organization of a Ministers' Relief Association. An offer by Mr. M. A. Shepherd of property valued at \$50,000 as a gift for a publishing and school fund was accepted, and steps were taken toward making an application of the sum. A committee was appointed to revise the constitution of the General Conference. Gratification was expressed over the revival of friendly feeling between the North and the South. Interest was declared in the education of freedmen and in civil-service reform. Efforts for the suppression of obscene literature were commended, and the action of the Government in refusing the use of mails for the circulation of such matter was approved.

Seventh-Day Baptist Church.—According to the statistical reports presented to the Seventh-Day Baptist General Conference, in September, the whole number of members of the

church for 1888 was 8,611, showing a net increase during the year of 8. The whole number of baptisms reported was 151. Nine churches had been organized, making the whole number of churches connected with the denomination 99. The number of Sabbath-schools was 86, and they returned 5,778 scholars. The denomination is represented in England by the Mill-Yard Church, London, instituted in 1654, and returning for 1888, 14 members, and the Natton Church, Tewkesbury, instituted in 1668, and returning 4 members. It has also mission churches at Shanghai, China, with 18 members, and at Haarlem, Holland, with 19 members. The American Sabbath Tract Society had received during the year \$8,968, and disbursed \$7,109, and had distributed 179,584 pages of tracts. The operations of the society were carried on by the distribution of tracts and periodicals in the United States, England, and Holland, and by the use of tents, in which preaching services were conducted, carried from place to place. Under its direction are published a general religious weekly newspaper, the "Sabbath Recorder," and two journals of a more special character. The publication of a quarterly periodical is contemplated. The Seventh-Day Baptist Education Society returned the amount of its funds and receipts at \$45,308. Only Milton College, Wis., and Alfred University, N. Y., made detailed statements of their condition. The whole number of students in these two institutions was 738. The receipts of the missionary society were \$8,154, in addition to which the society returned a permanent fund of \$1,454. Twenty-six missionaries were employed to visit 41 churches and 94 other preaching-places, in various parts of the United States, and reported in connection with the missions, 886 "Sabbath-keeping" families, 987 church-members, with 986 in Bible classes, and 23 added by baptism during the year. An American missionary and his wife, two native preachers, a Bible-woman, and three day-school teachers were employed in connection with the mission at Shanghai, China, and a woman medical missionary was to be sent out. Three day-schools returned 66 scholars. A boarding-school was to be established. One missionary was employed at Haarlem, Holland, who returned 4 additions to the church, and Bible-schools at Haarlem and Workum with 24 scholars. The accounts of the Seventh-Day Baptist Memorial Fund were balanced at \$9,564.

The Seventh-Day Baptist General Conference met at Adams, N. Y., September 19th. W. A. Rogers presided. The Committee on Denominational History reported that an autobiography of Elder Alexander Campbell and a number of papers on the "Ward family" had been published during the year. Measures were taken for the establishment of a "Seventh-Day Baptist headquarters" in connection with the assembly-grounds at Chautauqua. Resolutions were passed against the system of licensing

the traffic in intoxicating liquors, and demanding that "the evil shall be prohibited, not protected, by the laws of the land."

Baptist Churches of Canada.—The Baptists of the Dominion of Canada fall naturally into two grand divisions, viz., the Baptists of Ontario, Quebec, and Manitoba, and the Baptists of the Maritime Provinces. Owing to the great distance between the eastern and the western portions of Canada, intimate denominational relations between the two sections have never been established, and they have united in no branch of denominational work.

In Ontario, Quebec, and Manitoba, the Baptist denomination holds numerically the fifth place among the religious bodies, being outranked by Roman Catholics, Anglicans, Presbyterians, and Methodists. The statistics of the denomination for 1888 are: Number of ministers, 260; of church-members, about 27,000; of adherents, about 125,000. Of these about three fourths are in the Province of Ontario, one sixth in the Province of Quebec, and the remainder (500 or less) in the Northwest. About 26,000 of these are known as "Regular Baptists," and are included in 15 associations, which make restricted communion a term of fellowship. Outside of these associations are 25 or 30 churches with a membership of about 1,100, which differ in certain minor points from the associated churches.

Each province has a Home Mission Convention of its own. The Ontario Convention (founded in 1852) expends about \$6,000 annually in assisting feeble churches, and in opening up new fields within the province. During the conventional year 1881-'82, 28 missionaries were employed, who occupied 63 stations and received 250 persons into the fellowship of the mission churches. The Canada Baptist Missionary Convention, East (organized in 1859), expends nearly \$2,000 annually in home evangelization. During the year 1881-'82, 18 missionaries were employed, who occupied 47 different stations and baptized 52 converts. The Regular Baptist Missionary Convention of Manitoba and the Northwest (organized in 1881) has for its aim the early occupancy of the Canadian Northwest, and has secured the co-operation of the American Baptist Home Mission Society, the American Baptist Publication Society, the Baptist Missionary Convention of the Maritime Provinces, and of individuals and churches in Ontario and Quebec.

For foreign mission work there is one general society, the Regular Baptist Foreign Mission Society of Ontario and Quebec (founded in 1866), and two women's auxiliary societies, one for Ontario and one for Quebec. These support a vigorous mission among the Telugus of India at an annual expense of about \$12,000, of which amount the women's societies contribute nearly one third. The missionaries report 292 baptisms during the year 1881-'82. A seminary has been founded at Samulcotta

for the training of native preachers and teachers. The Grand Ligne Mission among the Roman Catholic French of the Province of Quebec receives contributions from Ontario, Quebec, the United States, etc. It has occupied a considerable number of stations, and sustains a school.

Woodstock College, founded in 1857, is provided with a fund of \$100,000 for grounds and buildings, and an endowment subscription of \$85,000, of which more than \$30,000 have been paid in. It furnishes four independent courses of study, and admits on equal terms students of both sexes. Toronto Baptist College was founded in 1879 by the aid of a gift and a pledge of support from Senator William McMaster, as a theological seminary, and has absorbed the former theological department of Woodstock College. It has a building valued at \$80,000, and four organized chairs of instruction. It was opened in 1881, and had eighty-one students during the first year.

The work of publication is conducted by the Standard Publishing Company, which has a capital stock of \$100,000. The dividends from \$45,000 of this stock, which was furnished by Senator McMaster, have been devised by him, provided they be not more than 6 per cent., to the Home and Foreign Missionary Societies and the Superannuated Ministers' Fund.

The Baptist Union of Canada (organized in 1862) is composed of officers of the denominational societies and colleges and of pastors and delegates of churches, and meets annually for the promotion of fraternal relations and the discussion of topics affecting the welfare and progress of the denomination.

In the maritime provinces the Baptists constitute a much larger proportion of the population, and are actually more numerous than in the western provinces. In New Brunswick they are outnumbered only by the Roman Catholics; in Nova Scotia, only by the Roman Catholics and Presbyterians; and in Prince Edward Island they rank fourth. The numerical strength of the denomination is, according to the statistics for 1888: Number of ministers, 188; churches, 848; church-members, 87,428; and of adherents, about 175,000. The work of the denomination in home missions, foreign missions, education, ministerial relief, etc., is transacted through the Baptist Convention of the Maritime Provinces. The Home Mission Board, in 1881-'82, assisted, at an expense of nearly \$5,000, in the support of 58 missionaries, occupying 50 fields of labor and serving 97 churches, in which 282 persons were baptized. Two churches were organized during the year. The Foreign Missionary Board expends \$10,000 a year, and supports three missionary families and a Zenana worker among the Telugus of India. The Ladies' Aid Societies furnished more than one third of the missionary contributions for 1881-'82. The literary institutions of the convention are the University of Acadia College, and Horton Academy, where students

are prepared for the college. Acadia College has buildings and grounds valued at \$100,000, and an endowment fund of nearly \$100,000, with an indebtedness of \$30,000. It has a literary department with seven professors, and a small theological department. At Horton Academy separate departments are provided for young men and young women.

English Baptist Missions.—The English Baptist Missionary Society received, during the year ending with its anniversary in April, £80,722. It had begun the year with a debt of £9,000, the larger part of which had been liquidated, but, as the operations of the society had been at the same time much enlarged, its books still showed a deficit of £4,575. Reports were made at the anniversary, of the condition of missions in India, Ceylon, China, Japan, West Africa (Camerouns and Victoria); the new Congo mission in Central Africa, where eleven missionaries were employed; the West India islands, and Norway, Brittany, and Italy, in Europe. Colleges were maintained for Hindoo and Urduo speaking young men at Delhi, and for Bengalis at Serampore, India, and at Calabar, Jamaica. At the autumnal meeting of the Baptist Union, held in Leicester, in October, the debt of the society was reported to be all discharged. It was also announced that fourteen missionaries were to be sent to China, sufficient funds having been promised to assure their outfit and annual maintenance.

The Baptist Zenana Mission, which is affiliated with this society, labors particularly among the women in India. It is supported by women, and employs 32 women as visitors to the Zenanas, and 50 Bible women and native teachers, and maintains 20 schools, which are regularly attended by 800 pupils.

BASUTOLAND. See CAPE COLONY.

BECHUANALAND. See CAPE COLONY.

BELGIUM, a constitutional monarchy in Western Europe. The King has power to convoke and dissolve the Legislature, and to conclude treaties; but treaties affecting the interests of the nation require legislative sanction. The House of Representatives is elected in the ratio of one member to at least 40,000 inhabitants, by citizens paying direct taxes to the amount of 43 francs, which restricts the franchise to about one thirteenth of the adult male population. The deputies are elected for four years, one half of the terms expiring every two years. All laws relating to finance and military service must originate in this Chamber. The members of the Senate are elected in the same way as the deputies; their number is exactly half that of the deputies, and their terms are twice as long. The reigning sovereign is Leopold II., born April 9, 1835, who succeeded his father, Leopold I., December 10, 1865.

The Cabinet.—The present Cabinet consists of the following members: Minister of Foreign Affairs and President of the Council, Hubert J. W. Frère-Orban, appointed June 19, 1878;

Minister of Justice, Jules Bara, appointed June 19, 1878; Minister of War, General Gratry, appointed Nov. 8, 1880; Minister of Public Works, Sabier Olin, appointed April 5, 1882; Minister of the Interior, Rolin Jaquemyns, appointed June 19, 1878; Minister of Finance, Charles Graux, appointed Nov. 8, 1880; Minister of Public Instruction, Pierre van Humbeeck, appointed June 19, 1878.

Area and Population.—The area of Belgium is 29,455 square kilometres, or 11,373 square miles. The area and population of the nine provinces into which the kingdom is divided, according to a census taken Dec. 31, 1880, were as follow:

PROVINCES.	Square miles.	Population.
Antwerp	1,098	577,232
Brabant	1,268	955,274
West Flanders	1,249	694,764
East Flanders	1,158	881,816
Hainaut	1,487	977,522
Liège	1,117	668,607
Limbourg	981	210,851
Luxembourg	1,706	209,118
Namur	1,414	322,620
Total	11,373	5,519,844

The density of population is 485 per square mile, exceeding that of any other country in Europe. In 1878 the number speaking French was reported as 2,256,860; Flemish, 2,659,890; both languages, 840,770; German, 38,070; German and French or Flemish, 28,980. Since the separation of Belgium from the Netherlands in 1830, the increase of population has been at the rate of one per cent. per annum. One fifth of the population follow agricultural pursuits, and one fifth trade and manufactures. The number of freehold proprietors in 1880 was 1,181,177, an increase of 29 per cent. since 1846. The population not only increases rapidly by natural increment, but in recent years by immigration to a slight extent. The population of Brussels, the capital, in 1880, was 394,940. There were six other cities with over 40,000 inhabitants: Antwerp, 169,112; Ghent, 131,481; Liège, 128,181; Bruges, 44,501; Mechlin, 42,381; Verviers, 40,944.

Religion.—The entire population, with the exception of about 15,000 Protestants and 3,000 Israelites, profess the Roman Catholic religion. The dissenting bodies not only enjoy full religious liberty, but their ministers, like the Roman Catholic priests, receive salaries from the state treasury. These salaries of the clergy, ranging from 600 to 1,360 francs for the parish priests, are supplemented by fees and contributions. By the census of 1880 there were 1,559 convents, containing 1,346 male and 20,645 female inmates.

Education.—The public-school system of Belgium has been for years the subject of bitter controversy between the Government party and the Clericals. The clergy have retained in a large measure the control of the education of the people, by maintaining schools supported

by private contributions, in opposition to the state schools. The educational work is done largely by Jesuits. The public schools are supported by the communes, the Government, and the provinces. The expenditure in 1880 amounted to 84,838,000 francs, about half of which was defrayed by the state. According to the military returns, about one sixth of the recruits are unable to read or write. Among the younger generation the proportion is considerably less. A law was passed in 1883 making Flemish the language of instruction in the intermediate schools in the Flemish parts of the country, but providing for preparatory departments in which both French and Flemish are to be taught.

Commerce.—The general commerce in 1881 was 2,787,881,075 francs' worth of imports, and 2,460,624,275 francs of exports; the special commerce by imports to the value of 1,629,871,040 francs, and exports to the value of 1,802,670,100 francs, the first representing the consumption of foreign and the second the exportation of domestic products. The largest import trade is with France and the next with the United States, followed by Germany, the Netherlands, Great Britain, and Russia. Of the exports, France takes the largest share, followed by Great Britain, Germany, and the Netherlands.

The coal-mines of Belgium produce about 16,000,000 tons per annum, supporting large metallurgical and other industries, and furnishing about 4,000,000 tons for export, chiefly to France.

The carrying-trade is mainly in the hands of the British. The mercantile marine in the beginning of 1882 numbered 68 vessels, of 75,666 tons, including 42 steamers, of 65,224 tons.

Communications.—Of 4,182 kilometres (2,600 miles) of railroad at the end of 1881, 2,888 kilometres were operated by the state and 1,294 by private companies. The working expenses in 1881 were 62·4 per cent. of the gross receipts of the state railroads, being 8·9 per cent. greater than four years before, owing to the purchases of unprofitable lines. The net earnings in 1881 were \$4,540 per mile.

The total length of telegraph lines in January, 1882, was 5,698 kilometres; of wires, 25,404 kilometres. The number of messages in 1881 was 6,861,985.

The post-office carried in 1881, 77,627,488 private letters and 20,301,762 postal-cards, besides 12,891,656 official letters, 40,588,000 packages, and 82,573,000 newspapers. The receipts were 12,801,321 francs, and the expenses 7,425,688 francs.

Finance.—The expenditure of the Government has exceeded the revenue every year since 1876. The budget for 1882 estimates the revenue at 296,647,709 francs, and the expenditure at 310,755,895 francs. For 1883 the estimated revenue from the various sources was as follows:

SOURCES OF REVENUE, 1882.		Francs.
Land-taxes	23,069,990
Assessed taxes	16,532,000
Trade licenses	6,900,000
Mines	400,000
Customs	21,700,000
Succession duties	18,560,000
Excise on foreign wines and spirits	2,860,000
Excise on native spirits	17,080,000
Excise on beer and vinegar	2,204,750
Excise on sugar	2,305,000
Registration duties and fines	84,155,000
Domains	1,655,000
Post-office	3,145,400
Railways and telegraphs	120,250,000
Packet-boats between Dover and Ostend	550,000
Miscellaneous receipts	15,021,630
Total revenue	299,571,760

The expenditure for the various departments was estimated as follows:

BRANCHES OF EXPENDITURE, 1882.		Francs.
Interest on public debt	97,519,119
Civil list and dotations	4,847,175
Ministry of Justice	16,084,111
Foreign Affairs	2,320,880
Interior	23,487,101
Public Instruction	31,597,997
Public Works	92,778,855
War	44,764,900
Finance	15,514,080
Gendarmerie	3,513,200
Miscellaneous expenditure	1,453,500
Total expenditure	324,852,813

The national debt amounted in 1882 to 1,799,566,644 francs. Of this, 219,959,632 francs, bearing 2½ per cent. interest, and 710,956,082 francs, bearing 4 per cent. interest, represent the share of Belgium in the old debt of the Netherlands. The rest was contracted for railroads and other works of public utility. Loans of 1878-78, amounting to 381,628,500 francs, pay 3 per cent.; 184,719,000 francs, issued in 1880, pay 4 per cent.; and 840,742,155 francs of railroad annuities pay 4½ per cent. All the debts except the old 2½ per cents have sinking funds provided for their extinction. By a law of 1879, the 4½ per cent. debt was ordered to be converted into one at 4 per cent. Treasury notes bearing 4 per cent. interest were issued in 1881 for floating liabilities amounting to 81,000,000 francs. In May, 1883, a new loan of 100,000,000 francs was issued. Sums aggregating as much as that have recently been appropriated for the Antwerp harbor improvements, the erection of schools, etc. To prevent the recurring deficits, the Government in the session of 1883 brought in a bill imposing additional taxes on coffee, tobacco, spirits, etc.; but the coffee-tax was withdrawn, that on alcohol rejected, and the mutilated bill finally passed by a majority of only six votes. Among the new taxes is one on securities, and another on operations of the stock exchange.

Politics and Legislation.—The struggle between the Liberals and Clericals occupied in 1883 the political arena, as in former years. The more advanced Liberals proposed to cut down the salaries of bishops and abolish canonries and vicarships. The Government toned down these demands, and carried an amendment providing for the extinction of the canon-

ries on the demise of the incumbents, and the withdrawal of the salaries of vicars found to be superfluous, at the discretion of the Government. The clergy protested against the withdrawal of subventions which were already too small, and which were only an indemnity for the ecclesiastical domains of which the Church was robbed in 1790. Minister Barras retorted that on that supposition their salaries would be a mockery, instead of being paid as they were for public services, and that the Church had other and secret sources of income. A law was passed taking away the exemption from military duty enjoyed by seminarists and the inmates of religious houses. An electoral-reform law provoked the opposition of the clergy, not less than the bills which affected them directly. This extends the right to vote in communal and provincial elections to all citizens who can pass an examination corresponding to the standard in the state elementary schools. This radical measure was introduced by the Government in fulfillment of a pledge made to the group of advanced Liberals in return for their support of the new taxes.

The Bernard Affair.—In the summer a noteworthy trial took place, originating in circumstances connected with the conflict between the ecclesiastical and civil authorities. The Bishop of Tournai, Monseigneur Dumont, one of the most uncompromising adherents of the Syllabus, was in 1879 deprived of his spiritualities by the Pope, on the ground that he was insane. Monseigneur du Rousseaux was appointed apostolical administrator of the diocese. The Belgian clergy have amassed enormous funds from gifts and fees, the legal title to which rests with the incumbents of the ecclesiastical offices for the time being, and is transferred by them to their successors by simply handing over the property. Monseigneur Dumont was, by a *ruse*, and before he knew of his disgrace, deprived of the possession of the episcopal palace, and of the custody of the diocesan funds. Bishop du Rousseaux, having knowledge of the intention of the deposed bishop to bring a suit to recover the funds of the diocese and test the legality of his dismissal, committed the episcopal treasury and documents into the keeping of Canon Bernard, with directions to place them out of the reach of Bishop Dumont. Although Tournai is the smallest and poorest of the six Belgian sees, yet the portable funds in the treasury amounted to more than 5,000,000 francs. Canon Bernard, after first consulting M. de Landtsheere, who was Minister of Justice in the last Conservative Cabinet, ran away with the securities and accounts to America, and deposited most of them in safety-vaults in New York and Boston. About 1,700,000 francs of the private funds of Monseigneur Dumont were sent back to Belgium in charge of a Montreal attorney, named Goodhue, who was arrested on his arrival. The Belgian Government applied for his extradition, and he was arrested at Havana and

sent back to Belgium on a charge of embezzlement. The securities were also obtained with some difficulty and held by the Belgian Government, subject to the decision of the court. Canon Bernard was honorably acquitted at his trial in August, as it was shown that he had not misappropriated the property, but had acted throughout in obedience to the orders of his superiors, although they were only general orders to conceal the account-books and securities, and so in taking them out of the country he had acted on his own discretion. This act was repudiated by Bishop du Rousseaux, who, when convinced that it was illegal, himself instituted the extradition proceedings.

BENSON, Edward White, an English clergyman, born in Birmingham, July 14, 1829. He was educated by private tutors and at the Birmingham Grammar-School, and gained an open scholarship at Trinity College, Cambridge. After a brilliant college career, in which he gained the senior chancellor's medal, the members' prize, a first class in the classical tripos, and a senior optime in the mathematical tripos, he graduated in 1852. He entered into holy orders, and became a master at Rugby, where he taught with marked success, and instituted some reforms. On the establishment of Wellington College, for sons of deceased army officers, he was chosen headmaster. Within a year he threw the school open to non-foundations, and made the curriculum the most liberal, if not the best, in England. He also made it a model in the matter of ventilation, drainage, dormitories, etc. In 1868 he became prebend of Lincoln, and in 1874 chancellor of the cathedral. When in 1877 the diocese of Truro was created, being set off from that of Exeter, Dr. Benson was made its first bishop. Under his administration a divinity school was founded, which has attained great popularity, and the church of St. Mary's, in Truro, was restored, beautified, and converted into a cathedral, at a cost of one million dollars. In connection with his diocesan work in Truro, he adopted and carried out the principle of employing lay help in the church, both in the reading of prayers and in preaching. He made himself familiar with the history and interests of the diocese, and performed his duties with so much industry and personal interest as to infuse new vigor into the religious life of the people. He made his administration also acceptable to the Non-conformists, and won their confidence to a degree which was only temporarily diminished by his hasty words of censure against the Liberation Society a few weeks before his nomination for the archbishopric. He was preacher to the University of Cambridge from 1864 to 1871, and to that of Oxford in 1875-'76. After the death of Archbishop Tait in December, 1882, Bishop Benson was chosen to succeed him, and his consecration as Archbishop of Canterbury, Primate of all England, took place March 29, 1888. Archbishop Benson has con-

EDWARD WHITE BENSON, ARCHBISHOP OF CANTERBURY.

tributed to the "Speaker's Commentary," has written much for periodicals, and has published in book-form "Work, Friendship, Worship," three sermons (London, 1872); "Boy-Life" (1874); "Singleheart" (1877); "Living Theology" (1878); and "The Cathedral in the Life and Work of the Church" (1879).

BERNARD AFFAIR, The. See BELGIUM.

BLACK, Jeremiah Sullivan, an American jurist and statesman, born in the Glades, Somerset co., Pa., Jan. 10, 1810; died at his home in York, Pa., Aug. 19, 1888. His ancestry was partly Irish and Scotch. James Black, his grandfather, came to America from the north of Ireland, and settled in Somerset co., Pa., where, in 1778, Henry Black, father of Jeremiah, was born, and where he lived. Henry Black was a man of note in his day.

Jeremiah's early education was obtained at school near his home, on his father's farm, and he displayed in youth a decided turn for intellectual and literary pursuits. He studied law, was taken into the office of Chauncey Forward, a prominent lawyer in Somerset co., and was admitted to the bar in 1831. In 1838 he married a daughter of Mr. Forward. After an active and successful practice of eleven years, he was raised to the bench. In politics he was a Democrat, claiming to be after the Jeffersonian pattern, and he was nominated, in 1842, by a Democratic Governor, for President Judge of the district in which he lived. This post he held for nine years. In 1851 Judge Black was elected to be one of the Supreme Court judges of Pennsylvania. After serving the short term, three years, he was re-

elected, in 1854, for a full term, fifteen years. On the accession of James Buchanan to the presidency, in 1857, Judge Black became Attorney-General. He was very industrious and successful, in connection with Edwin M. Stanton, in protecting the interests of the nation against false claimants to grants of land made by the Mexican Government to settlers in California before that country came under the control of the United States. When the secession crisis arrived, Judge Black showed himself to be considerably in advance of the weak and vacillating President. Buchanan held that there was no authority which could coerce a State, if it chose to secede and set up as an independent government for itself. His Attorney-General was clear that it was the absolute duty of the Government to put down insurrection anywhere and everywhere, under whatever plea or pretense it might be attempted to be justified, and that the Constitution contained no provision for a dissolution of the Union by secession or in any other wise. Gen. Cass having resigned as Secretary of State in December, 1860, Judge Black was appointed to fill the vacancy, Edwin M. Stanton taking the post of Attorney-General. He occupied this position during the remainder of Buchanan's administration, and it is claimed, in his behalf, by those intimately acquainted with the history of that critical period, that he was mainly instrumental in saving the Government from absolute disruption and falling into the hands of the secessionists.

In March, 1861, when Abraham Lincoln became President, Judge Black retired from public life. He was appointed United States Supreme Court Reporter, but soon resigned that position, and entered again upon the practice of law at his home, near York, Pa. He was engaged in several prominent lawsuits during the last twenty years of his life, and retained his vigor and professional skill even to the close of his career. The Vanderbilt will contest, the Milliken case, and the McGarrahan claim, were among the more noted cases in which he was engaged. Besides more strictly professional duties, Judge Black found time for contributing to current literature. He furnished an account of the Erie railway litigation, argued the third-term question in magazine articles, and had a lively newspaper discussion with Jefferson Davis.

Judge Black generally enjoyed good health, but an operation having become necessary, it was successfully performed, yet superinduced pyæmia, which was the immediate cause of his death. His religious views were those of the Campbellites, or Disciples of Christ. He left a wife, two sons, and two daughters, these last being married. One of his sons was elected Lieutenant-Governor of Pennsylvania, in 1882; the other resides in Texas and is a lawyer.

BLAKE, Hon. Edward, a Canadian lawyer and statesman, born in the county of Middlesex,

Ontario, in October, 1838. He is of Irish extraction, being descended, on his father's side, from the Blakes of Cashelgrove, Galway, and on his mother's from William Hume, M. P. for Wicklow, who during the rebellion of 1798 was shot by a party of rebels of whom he was in pursuit. William Hume Blake, his father, emigrated to Canada immediately after his marriage, and took up his residence near Peterborough. He was accompanied by his brother, a clergyman of the Episcopal Church; and on the appointment of the latter to a charge in the county of Middlesex, both families migrated westward, and settled in what was then an almost unbroken forest. Here Edward Blake was born, in a log-cabin; but the family removed to Toronto when he was a year old, and there his father became an eminent lawyer. The son followed, professionally, very closely in his footsteps, as did also his younger brother, Samuel Hume Blake, who never entered public life, but was raised at a very early age to the post of Vice-Chancellor in the court over which his father formerly presided.

Edward Blake was educated at Upper Canada College and University College, Toronto, and graduated in the University of Toronto. He was called to the bar in 1856, and rose with extraordinary rapidity to the very foremost position as a chancery practitioner; and during the ten years which elapsed before confederation took place he had gained such a position that he became, in 1867, a candidate for election at once to the House of Commons of the Dominion and to the Legislative Assembly of Ontario. In both positions he astonished even his most intimate friends by his extraordinary capacity for work. He was chosen leader of the Opposition in the Ontario Assembly very soon after it began its course, and during the whole of the first parliamentary term, though at the head of a small minority of the House, he kept the ministry almost constantly at a disadvantage. He frequently introduced bills which his legal experience and political sagacity suggested, and many of these were voted down, at the instance of the Government, only to be taken up afterward and carried through as Government measures. One of the principles which Mr. Blake most persistently kept before the public was the obligation resting on the Government to give the people's representatives as much detailed knowledge as possible of the destination of public moneys before they are voted by Parliament. This very principle was the final issue on which the Sandfield-Macdonald Government was defeated in 1871, and it therefore became the most important plank in the platform of its successor. Of the bills first introduced by Mr. Blake, and afterward taken up by the Government, was that which provided for the trial of contested elections by the courts instead of by partisan committees of Parliament. This system came into operation for the first time in the Prov-

ince after the general election of 1871, with the result of unseating an unusually large number of the members-elect. While many of the seats were vacant from this cause, the Legislature was convened, and Mr. Blake asked from it and obtained a severe condemnation of the Government for its policy of voting a large sum in aid of railways, without first specifying the roads to be aided and the amount to be granted to each. This censure of the administration led to a change of Government, and Mr. Blake took office as Premier. He kept it, however, for only a single session, as an act passed by the Dominion Parliament to abolish dual membership rendered it necessary for him to choose between the two positions which he had filled for four years.

His most noted speech in the Ontario Assembly was one in support of a resolution respecting the shooting of Scott by the Red river insurgents, under the leadership of Louis Riel, in 1870. The setting in motion of a new Constitution naturally gave rise to some friction, and not a few direct conflicts of opinion. The Constitution embodied in the British North America Act is distinctly federal in form, but it would, at the outset, have been easy to impart to it in practice a tendency toward centralization. Against every manifestation of such a tendency Mr. Blake steadily set his face. His summing up of the evidence against Sir John Macdonald, in the great "Pacific Scandal" case in 1878, decided the fate of the Conservative ministry.

He took office as a member of the Mackenzie ministry, without a portfolio, but he soon withdrew to devote himself to his private business and the recuperation of his health. He afterward held, under Mr. Mackenzie, from 1875 to 1877, the office of Minister of Justice, and in that capacity initiated and carried through a mass of important legislation. It fell to his lot also to discuss, by correspondence with the Secretary of State for the Colonies, Lord Carnarvon, a somewhat important point in connection with the relation of Canada to the mother-country. Long after the Red river insurrection was repressed, the final disposal of the chief insurgents continued to be a difficult question, owing to uncertainty as to what had been really promised to them. Lord Dufferin undertook to cut the Gordian knot by an exercise of the royal prerogative under his "instructions," without taking the advice of his ministers. A request was then sent to the Imperial Government to amend the instructions, so that thereafter the prerogative of pardon, like all other prerogatives, should be exercisable by the Governor only on the advice of his ministers. To this Lord Carnarvon demurred, but Mr. Blake's potent arguments at last convinced the imperial authorities of the absurdity and danger of leaving the way open to a foolish Governor to create serious trouble between the two countries, and the obnoxious instruction was modified as desired.

The general election of 1878 was disastrous to the Mackenzie administration, and among other defeated candidates was Mr. Blake, who had sat for South Bruce for two Parliaments. He remained out of the Commons for one session, and, when he returned to it as member for West Durham, he was chosen leader of the Liberal party.

Mr. Blake has always enjoyed in an eminent degree the confidence of his fellow-members of the Law Society of the Province, of which corporation he has for years been the presiding and chief executive officer. He has been equally fortunate in securing the suffrages of his fellow-graduates of the Provincial University, who have repeatedly elected him by acclamation to the position of Chancellor.

BLOOD. The Mechanism of the Arrest of Hæmorrhage.—Recent investigation of the blood has led to the discovery of a new element in its composition of great practical importance, in the shape of small granular bodies differing greatly from both the red and the white blood-corpuscles. Andral, by examining blood with the microscope, either pure or mixed, as it came from the vein, with one seventh of its weight of sulphate of sodium, found that all the fibrin was held in suspension under the form of little white corpuscles $\frac{1}{100}$ mm. in diameter. To these corpuscles filaments were added at the moment of solidification. Many other observers, also, have seen in the blood in process of coagulation these little pale granules, either single or agminated, and the filaments of fibrin. In 1878 M. Ranvier also pronounced on the nature of these little bodies. "It is probable, without being proved," he said, "that these angular granulations which exist in the blood are little masses of fibrin, and that they become the centers of coagulation, as a crystal of sulphate of sodium placed in a solution of the same salt becomes the center of crystallization."

Such was the state of our knowledge upon this subject when, in 1877, M. Hayem announced that there existed in the blood peculiar little elements having the singular property of undergoing instant alteration when they came from the body, more especially when they came in contact with a foreign substance. As these elements are destined to become the red corpuscles of the blood, he proposed for them the name of hæmatoblasts, believing them to be the same as those already described by other observers, only more or less altered in appearance. He also believed that the process of coagulation was intimately connected with the modifications of these elements. In works which he published from 1877 to 1881 he insisted upon the viscosity which the hæmatoblasts acquired when they were no longer in their normal condition, adhering then to one another, and to any foreign body with which they came in contact. It is only after having undergone a manifest metamorphosis, of which this state of viscosity is the first degree, that

they become the principal points of departure and of attachment of the filaments of fibrin. He also discovered that all the conditions known as having an effect in retarding or preventing coagulation also prevented these alterations of the hæmatoblasts, and *vice versa*.

Pursuing this study, he was led to examine the manner in which the flow of blood resulting from the wound of a vessel is arrested. He believed that the hæmatoblasts took an active part in the process. In the case of a wound of a blood-vessel, the hæmorrhage, at first rapid, gradually decreases, and then ceases. To explain this favorable result, the contraction of the wall of the vessel has been invoked. This is real, and even energetic, for arteries of medium and small caliber, but almost nothing for the veins. But this contraction can not of itself close the wound. It is evident that, in the arrest of hæmorrhage apparently by the formation of a clot, there is something peculiar, the mechanism of which needs explanation. In fact, during a hæmorrhage, the blood which passes between the lips of the wound in the blood-vessel is always new, and when collected in a vessel it is transformed into a gelatinous mass only after several minutes; why, then, does it form a solid plug between the lips of a wound, which soon opposes an obstacle to all issue of blood? Upon this point M. Hayem has endeavored to throw some new light. After exposing the jugular vein of a dog, a small wound is made in the vessel, and the hæmorrhage is allowed to cease spontaneously; immediately after, a ligature is applied to the peripheral extremity of the vessel. It is easy then to draw from the little wound a clot shaped like a nail, the point of which penetrates into the lumen of the vessel, the head resting upon the outer wall of the vein. By immediately placing this coagulum in a liquid which fixes the elements of the blood, its different parts may be examined with the microscope. The point and central portion are grayish, viscous, and composed of partly granular and partly amorphous matter. The granulations are composed of enormous masses of hæmatoblasts already altered, but still very distinct one from the other, while the amorphous matter results from the confluence into one common and coherent mass of the hæmatoblasts which have undergone the greatest change. The head of the nail, which is red on the exterior, contains in its center a prolongation of the viscous hæmatoblastic matter, and at the periphery the fibrillary meshes hold a great number of red corpuscles. In all the central, and, properly speaking, obstructive part, there are very few white corpuscles. It is, therefore, evident that the fibrin is added to a central nucleus composed almost entirely of hæmatoblasts. The formation of this nucleus may be studied in the mesentery of a living frog under the microscope. After having brought into the field of the microscope a vein of medium caliber, with transparent walls, an incomplete

section of the vessel is made with the point of a fine scalpel. An abundant hæmorrhage is produced, and, for a few seconds, nothing is observable but a mass of blood. Soon the blood flows more slowly, and is confined by a crown of elements attached to each other and adhering to the wall of the vessel. A few moments later the orifice of the wound is surmounted by a sort of whitish excrecence, through the elements of which the red blood-corpuscles insinuate themselves with difficulty. Far from being formed, as several observers have said, of the white blood-corpuscles, the wall consists of hæmatoblasts which have been retained during the flow of blood. At the moment when the hæmorrhage ceases, these have already become altered, and, continuing the observation, they may be seen to undergo all the changes described by the author.

The obstructing hæmatoblastic button holds only an insignificant number of white blood-corpuscles. These are spherical, smooth, not adhesive, for by continuing the observation for a few moments they may be seen to separate themselves from the mass of hæmatoblasts by means of their own inherent contractility. They do not appear to participate at all in the arrest of the flow, and they still possess their physiological properties and normal anatomical character, while the hæmatoblasts of the obstructing plug are already greatly modified. In this process the edges of the wound seem to play the part of foreign bodies. It is easy, moreover, to determine how the hæmatoblasts act with regard to a foreign body directly introduced into the circulation. By means of a slightly curved needle, carrying a thread of silver or platinum, the external jugular vein of an animal (dog) is pierced in such a way that about one centimetre of the cord remains within the lumen of the vessel. When the operation is well done, hardly a drop of blood will escape from either the point of entrance or exit of the needle. After two or three minutes—a length of time sufficient in the dog, in which the hæmatoblasts are very vulnerable—the segment of the vein traversed by the cord is separated by the aid of two ligatures, the first placed on the peripheral end, the second on the central. The trunk of the vein containing the thread is immediately detached and opened after being plunged into a liquid which fixes the elements of the blood. Already the thread is surrounded by a grayish mass, a little reddish here and there, composed of innumerable hæmatoblasts, the more readily recognizable the shorter the time that the thread has been in contact with the circulating fluid. When the thread is left for a longer time in the vessel, and the muff which surrounds it has become more voluminous, the constitution of the muff is entirely analogous to that of the hæmostatic nail already described.

The hæmatoblasts thus play an important rôle in the mechanism of the arrest of hæmorrhage. These elements are alterable to the

extent that, coming in contact with the edges of a wound, they become adhesive, as when in contact with a foreign body. In accumulating little by little around the open orifice of a vessel, they form there an obstacle at first insufficient; then, the first hæmatoblasts being arrested, they retain in their turn those which issue with the blood coming constantly in contact with them; the orifice of the wound retracts little by little, until finally it is completely closed by a solid and fixed plug. The other elements of the blood and the formation of fibrin only participate in this process in a secondary and accessory manner. The blood, then, contains within itself a powerful hæmostatic agent, and, were it possible to remove from the normal blood all of the hæmatoblasts, the wound of a vessel would cause a hæmorrhage which would have no tendency to cease spontaneously.

These experimental facts have a practical application of importance. All foreign bodies alter and retain the hæmatoblasts, and in this way is easily explained the formation of intravascular clots in living persons by the contact of diseased points in the cardiac or vascular walls. In the same way may be understood the hæmostatic action of foreign substances brought into contact with the surface of the wound, notably those of a pulverulent or spongy nature. According to the experiments of M. Hayem the modifications of the hæmatoblasts are favored by an elevation of temperature, and are extremely active at a temperature a little above that of the body. He asks if this may not explain the good effects of hot-water injections and applications in the treatment of hæmorrhages. For, to the action of water, which is in itself effective upon the hæmatoblasts, is added that of heat. Again, for blood to cease flowing it must contain hæmatoblasts, and these must be impressionable to the contact of foreign bodies. In animals like the horse, whose blood is only slightly coagulable, the hæmatoblasts are modified with comparative slowness. Again, these elements may undergo alterations in number and quality in cases of disease, and it may be concluded that in certain cases the constitution

of the blood itself may be a predisposing cause of hæmorrhage following the least vascular injury. That singular malady known as hæmophilia, the victims of which are known in popular language as "bleeders," is perhaps precisely the consequence of a particular state of the hæmatoblasts.

A practical example of the importance of this view may be given. The case is one of extreme and frequently repeated bleeding from the nose, and the patient is at the point of death from the loss of blood. For thirty years the patient has been subject at intervals to such attacks. On examining the blood, the fact of the relative rarity of the hæmatoblasts, and of their feeble vulnerability, is apparent—the changes which they undergo out of the organism occurring much more slowly than natural. It is suspected, therefore, that the bleeding, which has lasted for three weeks, and which returns whenever the plug is removed from the nose for a few hours, is due to these changes; and that by transfusing into the patient a certain quantity of normal blood containing active hæmatoblasts, the condition may be modified to advantage. A small quantity of venous blood is, therefore, injected into the patient's veins, and the nose-bleed is immediately and definitely arrested. The plugs are removed, but the bleeding does not return. It is evident that the conveying into the blood of the patient new and healthy blood from another body has effected a cure, and the active element in the cure is probably the hæmatoblasts.

BOLIVIA (*República de Bolivia*), an independent state of South America, whose limits before the war on the Pacific were between latitudes 10° and 24° south, and longitudes 57° 25' and 70° 30' west. The western limit has still to be negotiated between Bolivia and Chili. It is bounded on the north and northeast by Brazil, on the south by the Argentine Republic and Chili, and on the west by Peru.

The republic previous to the war was divided into nine departments, which, with their areas in square miles, capitals, and population (exclusive of 250,000 savage Indians), were approximately as follows:

DEPARTMENTS.	Area.	Population.	Capitals.	Population.
Atacama.....	70,173	10,980	Cobija.....	2,500
Beni.....	150,000	70,900	Trinidad.....	4,535
Chuquisaca.....	72,798	275,723	Sucre.....	26,624
Cochabamba.....	26,803	473,717	Cochabamba.....	44,908
La Paz.....	49,051	670,408	La Paz.....	58,092
Oruro.....	21,600	140,856	Oruro.....	8,492
Potosí.....	54,297	876,394	Potosí.....	22,774
Santa Cruz.....	144,077	176,088	Santa Cruz.....	11,788
Tarja.....	114,484	180,940	Tarja.....	8,875
Total.....	697,288	2,924,150		

The result of the war between Bolivia and Peru on the one hand, and Chili on the other, terminated in 1883, has been to deprive Bolivia of its former outlet on the Pacific, Cobija, but the treaty of peace which was being negotiated between Bolivia and Chili at Santiago, at the

close of that year, may still lead to a territorial rearrangement which shall give Bolivia the coveted port or ports. Should Bolivia be disappointed in this respect, Brazil is said to be ready to facilitate Bolivian trade through San Antonio on the Madeira river. Brazil would

engage to render the Madeira navigable for a distance of 400 miles, from its junction with the Amazon to San Antonio, and no transit dues of any kind would be levied by Brazil on goods forwarded to and from Bolivia. There was a rumor early in 1883 that a secret treaty had been actually concluded between the two governments to that effect as early as September, 1882. The real present outlet is to the Atlantic, through the Argentine Republic.

The President of the Republic is Gen. Campero (since June, 1880), the First Vice-President is Dr. Aniceto Arce, and the Second Vice-President, Dr. B. Salinas. The Cabinet in 1883 was composed of the following ministers: Interior and Foreign Affairs, Señor P. J. Silveti; Finance, Señor A. Quijano; Public Worship, etc., Dr. P. H. Vargas; War, General J. M. Rendon.

The United States Minister resident at La Paz is Mr. Richard Gibbs.

The Bolivian Envoy Extraordinary and Minister Plenipotentiary at Washington is Dr. L. Cabrera, with Dr. A. Aramayo as Secretary of Legation. The Bolivian Consul-General at New York is M. Obarrio; Consul at New Orleans, J. P. Macheca; and at San Francisco, F. Herrera.

In order to understand the position of Bolivia at the close of 1883, it will be necessary to review chronologically the events in Bolivia and Peru, of which the negotiation of a treaty of peace between Bolivia and Chili was the last.

The War on the Pacific in 1883.—In December, 1882, a convention was made and ratified at Santiago, between Italy and Chili, to the effect that all claims of Italian subjects arising out of the war in Bolivia and Peru should be determined by arbitration.

On April 20, 1883, the Congress assembled at Cajamarca closed its sessions after authorizing the Government to order an election to be held upon the basis of the census of 1882, for the nomination of a Constituent Assembly.

In May the partisan general Cáceres had several engagements with Chilian detachments, being defeated in two of them, at Balconcillo and Pampas de Sicaya, by Canto, and on May 22d in one at Larma by Garcia.

On May 11th a provisional treaty of peace was signed between Jovino Novoa on the part of Chili, and Lavalle on the part of Gen. Iglesias, the Peruvian commander. (The conditions submitted to by Peru will be found under CHILI, in this volume.)

On May 20th the opposition Congress of the Calderon-Montero faction in Peru assembled at Arequipa, on which occasion Gen. Montero delivered his message, in which he praised the faithfulness of Bolivia, and declared that he did not consider the time to have come for making peace. The message contained this passage: "At the time it became evident that the belligerents would be unable to arrive at an understanding through direct negotiation, Peru accepted the good offices of the United

States. But after a year's useless negotiations, after the energetic and comforting assurances of Gen. Hurlbut, the measured and diplomatic utterances of Mr. Treacott, and the impudent and hostile declarations of Mr. Logan, we became convinced that the United States were unable to be useful to us in any manner whatsoever."

June 2d, the people of Cerro de Pasco adhered to the Cajamarca peace proclamation of Iglesias. June 3d, at a meeting held at San Mateo (province of Nuerochiri) under the chairmanship of José Maria Sanchez, Peruvian citizens there present pronounced in favor of peace. A similar declaration was simultaneously made at Huaraz (department of Ancacho) and at Recuaz, for peace and Iglesias. On June 11th the Congress assembled at Arequipa confirmed the following nominations: President, Garcia Calderon; Vice-President, Montero; Second Vice-President, Cáceres. And on June 16th a new Cabinet was formed. A few days later Gen. Montero reviewed the troops under his command, and soon after a force was sent by him to Moquegua, under the command of Canevaro, 1,200 strong, and including 200 horse under the Cuban Céspedes, to operate against Tacna.

Toward the close of June the Chilian forces evacuated Pacasmayo, and the Chilian colonel, Y. Garcia, occupied Trujillo, where the Peruvian flag was hoisted.

Early in July the Chilian President, Santa Maria, delivered his message to Congress, at Santiago, containing the following passage: "Prior to the war, Bolivia had become an instrument of Peruvian intrigues and greediness, because that country had become dependent on Peru, which, for the past fifty years, stood as a sort of door-keeper of Bolivia, owning as Peru did the province of Moquegua, and thus, through the routes leading from Arica and Tacna to La Paz, controlling the only practicable communication between the interior of Bolivia and the Pacific. If the relations between Peru and Bolivia remained the same as they were then in this respect, now that the war has been carried by us to a safe issue, we should at all times in the future be exposed to the risk of seeing Bolivia attack us again at the instigation of Peru. It is no secret that politics are very uncertain in Bolivia, and any government capable of exercising efficient pressure on the latter may easily render Bolivia amenable to its purposes. Under these circumstances we owe it to our own safety in the future to deprive Peru forever of the means to do mischief in this respect. This is the chief reason why Chili insists, not on annexing the province of Moquegua, but on temporarily occupying, and eventually acquiring the same from Peru by purchase. All friends of a durable peace can not fail to admit that we have a right to insist on these conditions which present a guarantee of real tranquillity. These demands are not those

of a rapacious conqueror, they are merely the dictates of a wise policy whose object is to secure a lasting peace." The Peruvian general, Canevaro, presided over a meeting at Moquegua, and declared to the citizens there assembled that he was tired of the war.

On July 10th a crushing victory was achieved by the Chilean forces, led by Col. Gorostiaga, over the Peruvian partisan troops under Gen. Cáceres at Huamachuco. In this action 1,600 Chilean soldiers were engaged against over 4,000 Peruvians, the loss of the latter being 900 killed and many wounded, while the Chileans lost 56 killed and 104 wounded, including four officers. The Peruvians lost a number of officers, including Gen. Siloa, 11 pieces of artillery, and 800 rifles. The action lasted from 6 A. M. to 2 P. M. As soon as the news reached Gen. Lynch, the Chilean commander-in-chief, he sent a message to President Iglesias inviting him to Lima.

Commander Lynch subsequently published a decree calling on all officers formerly serving under Cáceres to appear at headquarters, or be treated as spies.

On August 10th Castro Zaldivar proceeded from Lima to join Gen. Iglesias, in order to undertake an important mission which the latter wished to put him in charge of. On Aug. 18th Iglesias issued a decree levying a capitulation tax of \$1, silver, per head.

Aug. 15th the Chilean commander at Huancayo chastised 3,000 pillaging Indians, and killed and wounded 800 of them. Simultaneously a mutiny, broken out among Peruvian troops in the province of Chancay, was promptly quelled. On Aug. 20th Gen. Iglesias made his entry into Trujillo, and was enthusiastically received by the population. On Sept. 11th the citizens of Cañete and the troops in the Pacaran district recognized the authority of Iglesias. On Sept. 15th the Chilean Minister of Foreign Affairs, Aldunate, left Valparaiso on his way to Callao to hasten the pacification of Peru. Two days later the steamer Amazon arrived at Payta with 600 Chilean infantry, sent by rail to Sullam, and thence to Piura, which place was occupied the next day. Sept. 18th, 3,000 monteneros were defeated by the Chileans at Huancayo, leaving 200 killed and wounded on the field. In the mean time news was received from the department of Ica that peace reigned there.

On Oct. 4th, 870 Peruvian officers submitted to the Chilean authorities, and Puno was occupied; on the 9th, Casma, a port of the Amcache district, declared in favor of peace. Ten days subsequently the city guard was reorganized at Lima.

On Oct. 20th the Chileno-Peruvian peace was signed at Ancon, and on the 24th Gen. Iglesias entered Lima as Presidente regenerador, Gen. Lynch having prior to this left for Barranco, near Chorrillos. On Oct. 28th Admiral Garcia y Garcia was appointed Peruvian minister in France and England. On the 29th

Arequipa surrendered, and Montero fled to Bolivia, where a cold reception awaited him. Prior to his flight he resigned the command in favor of Cáceres. The Peruvian minister, Bustamante y Salazar, left for Bolivia, and Gen. Osma, the Peruvian Minister of War, went to Arequipa.

On Nov. 9th the Chilean army of occupation was concentrated at Arequipa, and the Bolivian army at Oruro—the same day that the Bolivian envoy, Guijarro, left for Tacna to confer about peace with the Chilean envoy, Lillo. A week later Col. Lorenzo Iglesias, in garrison at Lima, marched with an adequate force to Chiclayo and Cajamarca, to quell an incipient rising. At the close of November a decree was promulgated declaring null and void all official acts of the Arequipa government from Jan. 1, 1883. This was particularly aimed at the Arequipa Congress of July, 1883.

The President of the United States, in his annual message of Dec. 4th, expressed himself about events on the west coast to the following effect:

The contest between Bolivia, Chili, and Peru has passed from the stage of strategic hostilities to that of negotiation in which the counsels of this Government have been exercised. The demands of Chili for absolute cession of territory have been maintained and accepted by the party of Gen. Iglesias to the extent of concluding a treaty of peace with the Government of Chili in general conformity with the terms of the protocol signed in May last between the Chilean commander and Gen. Iglesias. As a result of the conclusion of this treaty, Gen. Iglesias has been formally recognized by Chili as President of Peru, and his government installed at Lima, which has been evacuated by the Chileans. A call has been issued by Gen. Iglesias for a representative Assembly to be elected on the 18th of January, and to meet at Lima on the 1st of March next. Meanwhile the provisional Government of Gen. Iglesias has applied for recognition to the principal powers of America and Europe. When the will of the Peruvian people shall be manifested, I shall not hesitate to recognize the Government approved by them.

On Dec. 7th Gen. Lynch went to Chorrillos. The declaration of the Chilean President, that he would carry out the treaty with Peru in its entirety, had meanwhile strengthened the position of Iglesias materially. But he still had the Indian trouble in the interior to contend with. These Indians, led by a few unscrupulous men, were ready to adopt any pretext for their crimes, although their real motive was based upon their hatred of their so-called oppressors, inherited by their fathers from the time of the Spaniards. This hatred is the point that Cáceres depended upon to win power among them. He speaks the Quichua language, which gives him great prestige among them. Meanwhile Gen. Bermudez, the Peruvian commander, occupied Ayacucho, and the Chilean envoy, Monte, went to Buenos Ayres on Dec. 12th. The Bolivian peace commissioners, Baptista and Bosto, arrived at Santiago, Chili, accompanied by the Argentine and Brazilian ministers. One of the conditions contained in their instructions reads as follows:

On goods for Bolivia, Chili will take 30 per cent. of the customs duties, and Bolivia the remainder; railways to be constructed from Iquique to Lake Aullagas, and from Mejillones or Antofagasta to Potosí; the colonization of the country along the river Desaguadero to be effected, and the ratification of the frontier line passing the Desaguadero river to the Argentine line, Chili to permit the passage of Bolivian troops through its territory in the event of a war between Bolivia and a power not on her frontier.

On Dec. 14th President Iglesias wrote to Cáceres, assuring him of his personal security, should he feel disposed to capitulate. Puga was beaten by the Peruvian Government troops at Stollon, and Gen. Cáceres took position with 2,000 men two leagues from Ica. The United States minister at Lima asked permission for an American man-of-war to take soundings on the Peruvian coast.

Toward the close of the year 1883 the outlook in Peru became quite gloomy once more, owing to Cáceres's continuing to play a double-handed and treacherous game. While pretending to wish to visit Lima, he incited the Indians to plunder and murder. Two scenes of savagery, as barbarous as those which occurred during the mutiny in India, were enacted in the region which he pretended to govern. The Chilians, adhering to the terms of peace, declined to interfere.

The slight reduction of the import duties, after the departure of the Chilians, who had raised them to 50 per cent., caused considerable disappointment and some discontent in Peru. The finance minister of Iglesias reduced the duties from 50 per cent. to 35 per cent., thereby causing a check on importation. Many articles, formerly entering duty free, such as agricultural machinery, printing-presses and paper, etc., now pay a heavy duty. It thus happened that, in spite of the pacification of the country, buyers from the interior were scarce at Lima, although there was a good assortment of all sorts of merchandise. The paper money current had nevertheless improved at the close of December from fifteen paper dollars for one silver dollar, to twelve for one.

Another great difficulty which President Iglesias encountered was financial distress. Letters received at Lima during the last week of the year 1883 stated that, according to advices from La Paz, the Bolivian capital, the national guard had entered on active service; three battalions had been pushed forward toward the Peruvian frontier on the way to Tacna, 7,500 men were marching from the interior in the same direction, and the regular army—8,000 strong—was being concentrated at the capital. It was added that these movements might be interpreted as either to mean resistance to a possible but not probable Chilian invasion, or to effect a *coup de main* on the Peruvian territories of Arequipa and Mollendo. It was stated that the Peruvians of Arequipa and Puno were so thoroughly convinced of their danger that they had offered to form the

vanguard of the Chilian army should a march on the Bolivian capital be decided upon.

Finance.—In August Gen. Campero, President of Bolivia, read his message before the assembled Congress in La Paz. He said that the expenditures of the republic, during the fiscal year ended, amounted to \$3,800,528, while the income did not exceed \$2,527,515, leaving a deficit of \$803,012, to cover which a loan would have to be made. He added that the scrupulous punctuality with which Bolivia had attended to the settlement of all her pecuniary obligations had replaced the credit of the republic on a firm basis both at home and abroad, so that there were not wanting overtures from Europe for placing a Bolivian loan in that market. It was at the same time said that great activity prevailed on the banks of the Beni river in gathering India-rubber for export, which commanded on the spot 70 cents Bolivian silver coin, the cost of freight to San Antonio on the Madeira being 12 cents. A large transit trade was also going on between Potosí and the Argentine frontier.

Commerce.—Bolivian imports and exports in 1883 went almost exclusively *via* the Argentine Republic. No official statistics having been published, showing the imports and exports of Bolivia during the war, the amount of goods which entered the country in normal times has to be calculated upon the duties collected at the custom-houses. According to these, the import would not exceed \$6,150,000, while the export amounted to \$9,861,917 in 1881, the bulk of it being silver, \$6,897,180, other metals, \$1,186,787, and the balance cinchona-bark (quinine), India-rubber, etc.

Telegraphs.—There is a line from Ohillilaya, on Lake Titicaca, to La Paz and Oruro, 188 miles in length. It is intended to extend this line to Cochabamba and Sucre.

BRAZIL (Imperio do Brazil). (For details relating to area, territorial divisions, population, etc., reference may be made to the "Annual Cyclopædia" for 1878.)

The Emperor is Dom Pedro II, born Dec. 2, 1825; proclaimed April 7, 1831; regency until July 23, 1840; crowned July 18, 1841; married Sept. 4, 1843, to Theresa Christina Maria, daughter of the late King Francis I of the Two Sicilies.

The new Cabinet, formed after the resignation of the one presided over by Viscount Paranagua, was, on May 24, 1883, composed of the following ministers: President of the Council of Ministers and Minister of Finance, Senator Councilor of State, Lafayette Rodrigues Pereira; Interior, Francisco Antunes Maciel; Justice, Francisco Prisco de Souza Parizo; Foreign Affairs, Councilor Francisco de Carvalho Soares Brandão; War, Antonio Joaquim Rodrigues, Jr.; Navy, Antonio de Almeida Oliveira; Agriculture, Commerce, and Public Works, Councilor Affonso Augusto Moreira Penna.

The Council of State was composed of the

following members in ordinary: The Princess Imperial, Donna Isabel; Prince Gaston d'Orléans, Count d'Eu; the Senators Viscount de Abaeté, Viscount de Muritiba; Viscount de Bom Retiro; Viscount de Nictheroy; Senator J. J. Teixeira; Vice-Admiral J. R. de Lamare; Dr. P. J. Soares de Souza; Senator M. P. S. Dantas; Councilor Martin Francisco; Councilor J. C. de Andrade; Senator J. L. V. Cansansão de Sinimbu; and of members extraordinary: Senators Viscount de Parana-guá; Affonso Celso; L. A. Vieira da Silva; J. B. da C. Figueiredo, and Lafayette.

The President of the Senate, which comprises 58 members elected for life, was J. L. Lima Duarte; and the Vice-President, A. M. de Barros.

The President of the Chamber of Deputies, with 122 members elected for four years, was Councilor J. F. de Moura; and the Vice-President, J. L. Lima Duarte.

The presidents of the several provinces were as follow: Alagoás, Dr. H. M. Salles; Amazonas, Dr. J. L. da Cunha Parana-guá; Bahia, Councilor Pedro Luiz P. da Souza; Ceará, Dr. Satyro; Espirito Santo, Dr. A. P. N. Accioly; Goyaz, Dr. A. G. Pereira; Maranhão, Dr. J. A. P. Ovidio; Matto-Grosso, Baron de Bacovi; Minas-Geraes, Dr. A. G. Chaves; Pará, Viscount de Maracajú; Parahyba, Dr. J. A. do Nascimento; Paraná, Dr. O. A. C. de Oliveira Ballo; Pernambuco, Dr. J. M. de Freitas; Piahy, Dr. F. P. Salles; Rio Grande do Norte, Dr. F. M. Vianna; Rio de Janeiro, Councilor B. A. Gavião; Sta. Catharina, Dr. F. C. de F. Sonto; São Paulo, Baron de Guajara; São Pedro do Sul, Councilor J. J. d'Albuquerque; Sergipe, Dr. F. G. C. Barreto.

The Archbishop of Bahia, the Rt. Rev. L. A. dos Santos (1880) is Primate of all Brazil; and there are eleven bishops: those of Pará, São Luiz, Fortaleza, Olinda, Rio de Janeiro, São Paulo, Porto Alegre, Marianna, Diamantina, Goyaz, and Cuyabá.

The Brazilian Minister Plenipotentiary and Envoy Extraordinary to the United States is Councilor Lopes Netto; the Secretary of Legation, J. G. Valente; and the Consul-General of Brazil at New York, for the Union, is Dr. Salvador de Mendoça.

Temporary changes in the Brazilian legation at Washington are said to be due mainly to the disposition on the part of Brazil to serve the interests of peace between Chili and Peru. Senhor Netto, Brazilian minister to the United States, left Washington for Chili about the middle of August, with instructions to express to the Chilian Government the anxiety of Brazil to have a satisfactory peace established between Peru and Chili, and that he was authorized to act as a mediator to this end, if his services were desired. Under his instructions he is to remain in Chili for two years, and, while there, is to attend to some pending Brazilian claims.

The United States Minister to Brazil is Hon.

T. A. Osborn, and the Consul-General at Rio de Janeiro, O. C. Andrews.

Army.—The actual strength of the army in 1883 was 11,333. The distribution of the several arms was as follows: Artillery, 1,951; cavalry, 2,140; infantry, 7,242; 2,149 more soldiers would have to be enlisted to complete the number fixed by law. The artillery counts three mounted regiments, four foot battalions, and one battalion of sappers; the cavalry, five regiments, one squadron, and four companies; the infantry, twenty-four battalions and eight companies.

Navy.—The navy, in 1883, consisted of seven steam-ironclads, one steam-frigate, seven steam-corvettes, sixteen steam-gunboats, two sail of the line, and two smaller crafts, with an aggregate of 8,148 men, and a total armament of 123 guns. There was, besides, one school-ship; and one ironclad and five gunboats were being built.

The *personnel* of the navy consisted of 15 general staff-officers, 878 first-class officers, a sanitary corps 68 strong, 91 pursers, 79 guardians, and 181 engineers; an imperial marine corps 2,922 strong, a naval battalion of 450 men, and 1,520 apprentices; total, 5,704 men.

The Frontier Dispute.—There is a long-pending dispute between France and Brazil, concerning the precise border-line between the French and Brazilian Guianas, specially relating to the territory between the Oyapok and Amazon rivers. It seems that the Treaty of Utrecht assigned to France a portion of Guiana not clearly defined, nor did the treaty of 1815 establish the boundary with any greater precision. These lands are isolated by one of the branches of the Amazon in its delta, and are represented as being quite valuable for grazing purposes.

Postal Service.—The number of letters forwarded by the Brazilian Post-Office in 1881-'82 was 35,815,869, against 31,228,635 in 1880-'81; the number of post-offices was 1,610. The gross amount of postages collected amounted in 1881-'82 to 1,513,872 milreis, and the expenditure was 1,741,721 milreis.

Railroads.—The first railroad in Brazil, the Macia, 18 miles in length, went into operation on Dec. 16, 1853. There are at present 2,400 miles in operation and 2,200 being built. The Government owns and administers several lines, and, as a rule, guarantees an income of 7 per cent. on the necessary capital invested in the construction of private roads. The number of miles of railroad owned and in operation by the Government is 800; and it also has nearly the same number of miles of railroad in course of construction. Most of the rails with which the roads have been made were imported from England, while a part of the rolling-stock was brought from the United States. The roads are surveyed and built almost wholly by Brazilian engineers.

Under the provisions of a recent law the Government grants concessions to railroad

companies, with the following chief conditions: After the Government is satisfied that the capital of a new company applying is sufficient, an annual interest of 7 per cent. is guaranteed, the latter payable half-yearly during thirty-two years. While the construction of the line proceeds, the Government pays interest on the sums of money it considers necessary; the latter are deposited in a bank, and can only be drawn as wanted. The state grants gratuitously to such companies all Government lands that may be requisite for the lines, depots, entrepôts, shops, etc., designated in the contract. The companies are allowed to import duty-free all material and, for twenty years, coal and all other fuel.

In return for these privileges the companies engage to forward at reduced rates all Government officials, luggage, and material, and, if called upon to do so, furnish the Government whatever information it may wish to obtain respecting the business of the line.

From the moment the dividends exceed 8 per cent. per annum, the excess is equally divided between the Government and the company; but this participation of the Government in the excess of profits ceases as soon as the sums of money advanced for interest are paid back. Should the dividend at any time exceed 12 per cent. during two consecutive years, the companies, if called upon by the Government to do so, bind themselves to reduce their freight rates. If the construction capital be procured abroad, the exchange is fixed at 27*d.* per milreis. The following are the leading companies that have gone into existence on this basis:

LINES BUILT UNDER GOVERNMENT GUARANTEE.

LINES.	Length, in kilometres.	Rate of interest guaranteed, per cent.	Capital, in milreis.
Natal to Nova Cruz.....	121	7	5,496,062
Conde d'Eu.....	121	7	6,000,000
Recife to São Francisco.....	124	7	14,977,965
Recife to Litoro.....	121	7	5,000,000
Maceio to Imperatriz.....	88	7	4,558,000
Bahia to São Francisco.....	124	7	16,000,200
Bahia Central.....	302	7	13,000,000
Campos to Carangola.....	847	7	6,000,000
São Paulo to Rio Janeiro.....	281	7	10,000,000
Santos to Jundiaby.....	189	7	23,555,550
Paranagua to Coritiba.....	109	7	11,492,042
Dona Theresa Christina.....	112	7	5,451,000
Dom Pedro I.....	120	6	4,000,000
Rio Grande do Sul to Cacequy..	225	6	18,521,423
Cacequy to Urugayana.....	269	6	10,000,000
Quarahim to Staquy.....	186	6	6,000,000
Rio to Minas.....	168	7	16,150,000
Total.....	2,899	..	171,197,532

All these lines have been built with English capital, with the exception of two, the Recife-Litoro, which is Brazilian, and the Paranagua-Coritiba, which is French.

Telegraphs.—The first telegraph lines were laid in 1852, but not till 1866 did Petropolis and Rio de Janeiro receive telegraphic communication. Now, Rio has two telephone lines,

and the empire counts land telegraphs of a total length of 7,419 kilometres of line and 18,250 of wire, communication being established by means of 136 stations. The number of telegraphic messages sent in 1881-'82 was 739,906; the gross receipts were 1,241,770, and the expenses 1,632,549 milreis.

Trade-Marks.—Brazil protects the trade-marks of persons domiciled in the country and foreigners having in Brazil an establishment of commerce or industry. Foreigners who do not possess branch houses or manufactories in Brazil receive no benefit from the law, except in cases where treaties of reciprocity exist between Brazil and their own country.

Foreign trade-marks are registered at the office of the secretary of the Tribunal of Commerce at Rio de Janeiro.

The legal effect of the registry continues for fifteen years, and may be renewed for another term of the same duration.

A Floating Cathedral.—A floating cathedral on the Amazon river is the most novel idea conceived and to be carried out by enterprising missionaries in Brazil. The matter has been taken in hand by the Catholic Bishop of Pará and Amazonas. The best architects and ship-builders of Europe are to construct it complete and in magnificent style, and it is to be baptized "Christopher," because it is to carry Christ over the waters. It is to attend to the spiritual wants of the whites and Indians inhabiting the banks of the great river.

Emancipation.—A new issue is steadily forcing its way into Brazilian politics, and will, at no distant day, form a disturbing factor of vital importance to the country. Thus far there has been no abolition party and no division between the old parties on that question. Since the beginning of the present year a new movement has set in which promises to change all this. In the northern provinces, especially in Ceará, the popular sentiment in favor of abolition has been worked up to such a pitch that the people are voluntarily emancipating their slaves. Ceará has already liberated about 6,000 slaves, and may free all before the close of the year. As this movement is principally confined to the northern provinces, it is not improbable that the abolition of slavery in Brazil will be transformed into a sectional issue at no distant day, and that it will lead to troubles which will have an important influence upon the future of the country.

Slavery.—In July, 1883, there were in Brazil 1,846,648 slaves. When the gradual abolition decree of Sept. 28, 1871, was passed, there were officially registered 1,547,660 slaves; since then about 130,207 slaves have died, the Government has liberated 12,898, private individuals and savings-banks 56,056, and 1,851 slaves have bought their freedom themselves. The average value of slaves is at present about \$375, so that the amount of slave property still existing in Brazil represents a value of something like \$505,000,000. The provinces in

which the greatest number of slaves has been liberated are Rio de Janeiro and the neutral district, 23,002; Rio Grande do Sul, 9,100; Minas-Geraes, 7,108; Bahia, 7,087; São Paulo, 6,681; Pernambuco, 5,649; Pará, 4,709; Maranhão, 4,644, and Ceará, 4,272. In other provinces the number ranges between 99 and 1,871.

Immigration.—The immigrants in the first six months of 1888 numbered 14,225, among whom were about 700 Germans, 6,000 Portuguese, and 5,000 Italians. Only 2,500 were agriculturists.

The "Rio News," of July 15, 1888, expresses itself about immigration into and naturalization in Brazil to the following effect:

According to the "Diario Official" 5,309 foreigners have become naturalized in Brazil (not including colonists) in the period between 1825 and 1882—a period of fifty-seven years. There is a significance in this result which will not be unnoticed when comparisons are made with the enormous number of foreigners naturalized in the United States during the same period. When it is considered that these fifty-seven years comprise the entire reign of the present Emperor, whom the civilized world has been pleased to call one of the most enlightened and liberal monarchs of the age, that they have been years of only briefly interrupted peace, and that during all this time Brazil has had a very large population of foreigners engaged in commercial and industrial pursuits, the greater part of whom could easily have been transformed into Brazilian citizens, there is certainly very little cause for satisfaction. What with her incubus of slavery, her great landed estates, her religious intolerance, her jealousy of foreigners, her vices of administration and her oppressive exactions upon commerce and industry, she has shut out this great stream of wealth and population which has been steadily flowing by her doors all these years, until now, in her weakness, she is able to secure only the scattering drops which the rushing current casts upon her shores. It is not altogether a pleasant theme for consideration, for it is a living proof that the reign of Dom Pedro II has been very far from liberal and enlightened, and that the dominant policy which has thus far controlled Brazil has resulted only in shutting her out from the progress of the world and in retarding her national growth.

Naturalization.—The new bill relating to naturalization of foreigners in Brazil, stipulates that all foreigners residing for three years in the country shall thereby become and be considered Brazilian citizens, unless during the interval they have made a declaration before their consul that they do not wish to relinquish the nationality of their native country. The time of residence for acquiring Brazilian citizenship will even be reduced to two years, if the foreigner marries a Brazilian or holds office under the Government. The naturalized citizen is to be eligible to municipal office and other public functions, and may even become regent of the empire. This law would place Brazil even above the Argentine Republic in point of liberality toward foreigners, and the probability is that the latter will follow the example. The Brazilian press unanimously approves of the project.

Finances.—In financial matters the present situation of Brazil is no less critical, and the

danger is even more imminent. Her public indebtedness has been steadily increasing until it is now much greater than her income warrants, and her expenditures are largely and regularly in excess of her revenue. There has been no annual surplus since 1856-'57, only two since 1846-'47, and only four since 1836-'37. According to an abstract of the national budgets during the period between 1827 and 1879-'80 inclusive, the aggregate of these deficits amounts to about \$350,000,000. The interest charged upon her funded debt is now nearly two fifths of the total revenue.

These statements will, of course, excite surprise abroad, simply because of the high credit which Brazil enjoys in the London market. The Brazilian Government is scrupulously careful to meet the interest charges on its foreign debt promptly and fully, for which reason its funds are quoted high and excite no distrust. To do this, however, new loans have been floated, *apólices* (bonds) of internal indebtedness have been issued, taxation has been increased, and local creditors have been compelled to wait years for the payment of their accounts. And then, too, these loans and investments in London are nearly all in the hands of a small circle of capitalists known as the "Brazilian ring," at whose head is the famous house of Rothschilds; and this ring is very careful not only to place investments on the market to the best advantage, but also to suppress every item of information detrimental to Brazilian credit. To this end journals and journalists are subsidized (a deficiency credit has been under discussion in the Brazilian Legislature, in which two subsidized London journalists are specially mentioned), flattering articles are published in the newspapers and reviews, and everything is made easy and comfortable for all the parties concerned.

An epitome of all the imperial budget laws since 1823 has been published in the "Diario Official" by Senator Castro Carreira. A comparison with the annual reports of the Minister of Finance shows that its figures are correct, or as nearly so as careless typographical work will admit. This epitome includes quinquennial summaries and abstracts of public indebtedness, which are of great value in comparisons. In order to make this abstract cover the period of the present system of "public improvements," beginning with the construction of the Dom Pedro II railway, and also to comprise these quinquennial debt abstracts, it is necessary to take the fiscal year 1855-'56 as a starting-point. During the preceding five years the aggregate revenue of the Government had been 176,876,699 milreis, and the aggregate expenditure 182,607,684, leaving a deficit of 6,280,985. The total indebtedness of the empire at the end of this period (1854-'55), including the 1852 foreign loan of £1,040,600, was as follows, the Brazilian milreis at par being equivalent to 54½ cents United States gold:

	Milreis.
Foreign debt, 4½* and 5 per cent.....	51,780,314
Internal debt, 4, 5, and 6 per cent.....	57,944,117
Total	109,704,881
Overdue amortization.....	552,675

	Milreis.
Foreign debt, 4, 4½, and 5 per cent.....	112,194,525
Internal debt, 4, 5, and 6 per cent.....	282,590,558
Total	351,727,078
Overdue amortization.....	2,064,159

During the five years from 1855-'56 to 1859-'60, inclusive, the reign of reckless expenditure on public works began, and since then there has been but one single year (1856-'57) in which the revenue has exceeded the expenditures. Some of these works were necessary, and either have been or will be productive; but in great part they have been unnecessary and enormously expensive. The best of these investments has been the Dom Pedro II railway, upon which the Government has expended, not including interest on investment, over £10,000,000. In this period three foreign loans were made, aggregating £3,407,500, while the internal debt was slightly decreased. The aggregate deficit for the five years was 14,766,501 milreis, the average annual revenue being 45,653,024 milreis, and the expenditure 48,806,324. With that year, 1860-'61, a new portfolio was added to the Imperial Cabinet, that of "Agriculture, Commerce, and Public Works" — a department which was designed to preside over and develop the wealth-producing industries of the nation, but which has succeeded only to the extent of mischievous interference and burdensome expense. In 1860-'61 its operations were covered by the modest expenditure of 3,871,544 milreis; in 1880-'81 this annual expenditure was 36,796,932. In the last year of this quinquennium (1864-'65) a war broke out between Brazil and Paraguay, which lasted through the succeeding five years. But one foreign loan was contracted, amounting to £3,855,800, but the internal debt was increased to 84,265,751 milreis by the issue of 6 per cent. *apolices*. A large amount of paper money was also put into circulation. The aggregate deficit of the five years amounted to 39,291,247, the average annual receipts being 52,591,518, and the expenditures 60,449,967.

In the next five years (1865-'66 to 1869-'70) the expenditures of the Government were enormously increased by the war with Paraguay, the total cost of which is calculated to have been 613,188,263 milreis. The extraordinary credits of the Government during this period amounted to 297,901,468 milreis, taxation was largely increased, and new issues of paper money were made. The aggregate deficit amounted to 324,808,487, the average annual revenue was 75,378,204, and the expenditure 140,239,901. One foreign loan, amounting to £6,963,600, was raised in London, and the internal debt was largely increased by the issue of 6 per cent. *apolices*. The total public debt (1870) was as shown in the next column.

In the five years following there was a large falling off in the expenses of the War and

Navy Departments, but the steady increase in those of Agriculture and Finance kept the total up to an unwarranted high figure. Although this was a period of peace, the expenditures were largely disproportionate to the revenue, the aggregate deficit for the five years being 56,612,024 milreis. Extraordinary credits were authorized to a total of 70,426,709, more paper money was issued, and taxation was again increased. One loan of £3,459,600 was placed in London, and the internal debt was increased to 289,562,250 milreis. The average annual revenue was 102,850,543, and the expenditures 114,173,147.

In the last quinquennial period under review, there was a steady increase in the expenditures of the Department of Agriculture, and the aggregate expenditures of all the departments largely exceeded those of the five years of the war. This period included the great drought of Ceara, in which there was so great a loss of life and property, and upon which the Government expended 60,503,848 milreis for public relief. A large part of this expenditure, however, was swallowed up by speculators and dishonest public officials, of whom the Government has the names of 1,589, with evidence of guilt, not one of whom has ever been prosecuted. The aggregate deficit of these five years was 208,226,627 milreis, the average annual revenue 101,489,514, and the expenditure 149,134,839. The extraordinary credits footed up to 194,252,407, a large issue of paper money was made, and the internal debt was increased. One loan was made in London (1875) amounting to £5,801,200, and a national loan was made in 1879 amounting to 51,885,000 milreis. At the close of this period (1880) the state of the public debt was as follows:

	Milreis.
Foreign debt (estimated at 37d.), 4, 4½, and 5 per cent.....	144,059,479
Internal debt, 4, 5, and 6 per cent.....	416,906,722
Total	560,966,201
Overdue amortization.....	2,364,973
Paper currency (April 1, 1880).....	189,199,591
Public deposits (finance report, 1880).....	52,954,385
Treasury bills (April 30, 1880).....	11,692,700
Total	817,520,849

Tabulating the aggregate quinquennial revenue receipts, expenditures, and deficits of this period of twenty-five years, gives the following result:

QUINQUENNIAL.	Receipts.		Exp. ditures.		Deficits.	
	Milreis.	Milreis.	Milreis.	Milreis.	Milreis.	Milreis.
1855-'56 to 1859-'60.	228,265,120	243,091,621	14,766,501			
1860-'61 to 1864-'65.	362,957,559	302,245,366	39,291,247			
1865-'66 to 1869-'70.	376,891,019	701,199,505	324,308,486			
1870-'71 to 1874-'75.	514,253,713	570,865,787	56,612,025			
1875-'76 to 1879-'80.	587,447,569	745,674,196	208,226,627			
Totals	1,919,810,009	2,568,019,895	648,204,886			

Average annual deficit, 25,728,195 milreis. Since 1879-'80 only the accounts of the year

* The loan of 1852, amounting to 9,201,004 milreis, was the only one issued at 4½ per cent.

following have been definitely settled, from which it appears that the receipts were 127,076,863, the expenditures 188,583,090, and the deficit 11,506,727. For 1881-'82 the Government admits a deficit of 5,054,000; but on removing some 7,000,000 milreis of Treasury bills, deposits, etc., from the revenue, and nearly 1,000,000 from the expenditures, which had no place there, the actual deficit amounts to 10,815,847. For 1882-'83 the Government's estimate places the deficit at 6,104,000; but as the revenue receipts include 17,666,800 of Treasury bills omitted, 141,200 in nickel coins, and 3,500,000 of deposits for special purposes, the deficit really amounts to 27,412,000 milreis as shown on the minister's report. For the current year the "Jornal do Commercio" calculates that the deficit on actual appropriations will be 28,866,066, making a total of 62,249,842 for the two years covered by the budget law now in force.

On the 19th of September, after a session of 139 days, the General Assembly of Brazil was formally adjourned. Although the financial state of the country is most critical, the imperial budget laws for the ensuing year were not passed, and no measures were adopted to aid or relieve the public Treasury. Supplementary or deficiency credits were passed, to an aggregate of 18,000,000 milreis (\$9,000,000), one of which was for a deficit of 12,000,000 milreis in the public relief expenditures of the Ceará drought of 1878-'80. As the public departments are now running under the budget laws of 1882, which were prorogued to 1883 because the General Assembly failed to pass the regular annual appropriations, it is evident that this failure of last session can not be otherwise than inimical to a proper fiscalization of the public expenditures.

Revenue of the Provinces.—The following table shows the revenue of each province in 1882-1883, the total being 82,682,058 milreis, of which 17½ per cent., altogether 5,688,943 milreis, were spent on public instruction:

PROVINCES.	Revenue.	Proportion per cent. spent on public instruction.	Proportion per cent. of popu.
	Milreis.		
Amazonas	1,664,000	6.79	4.1
Pará	2,743,000	13.5	5.6
Maranhão	788,596	14.8	1.7
Piauí	249,431	10.9	1.1
Ceará	808,700	24.5	1.4
Rio Grande do Norte	308,827	26.4	1.5
Parahyba	460,141	18.8	0.8
Pernambuco	2,786,457	26.4	2.2
Alagoas	699,355	30.9	2.6
Sergipe	716,638	16.9	3.8
Bahia	3,484,687	15.9	1.8
Espirito Santo	358,980	22.7	4.1
Rio de Janeiro	6,358,684	19.9	4.2
São Paulo	3,748,480	14.2	2.1
Minas-Geraes	3,084,449	24.6	3.4
Paraná	797,000	14.5	2.6
Santa Catharina	343,354	26.6	3.2
Rio Grande do Sul	2,917,220	18.7	2.0
Goyaz	332,284	16.1	1.6
Mato-Grosso	341,338	21.6	3.8

In 1854 the total number of primary schools in the provinces was 4,014; in 1883 it had increased to 6,180, the increase being about two per cent. per annum.

The Mint.—Under provisions of the law of 1849 there have been coined since that year, to the close of 1882, 44,948,083 milreis gold and 18,979,927 milreis silver. From 1708 to 1883 the mint at Rio de Janeiro has coined 262,139,212 milreis gold and 85,508,816 milreis silver.

Commerce.—According to the last "relatório" of the Minister of Finance, the foreign trade of Brazil (official values), during the fiscal years 1880-'81 and 1881-'82, was approximately as follows, the minister stating that full reports had not been received from all the provinces:

MERCHANDISE.	1880-'81.	1881-'82.
	Milreis.	Milreis.
Imports	180,453,700	184,118,800
Exports	238,567,700	216,706,500
Total	414,026,400	400,825,100

From this it will be seen that the total foreign trade of the country is about 400,000,000 milreis, or, in round numbers, about \$200,000,000 at the par of exchange. During the past fiscal year (1882-'83), although no general statistics of that year have been compiled, it is certain that the above totals were greatly reduced. The imports were considerably decreased because of the general stagnation in business and the increase in taxation. Toward the end of 1882 a new surtax of 10 per cent. was imposed on imports, and the customs-warehouse charges were largely increased. The immediate result of this step was a decrease in imports, both on account of the enhanced cost of goods and the additional costs of storage. Under the new warehouse charges, importers are limiting their receipts to current demands, and are keeping their stock reduced to the narrowest limits possible. In exports, with the exception of coffee, and possibly rubber, there was also a large falling off, owing to the failure of crops in the northern provinces, and to the general decline in many branches of industry. In the rubber-trade it is possible that the exportation was also reduced through the attempt to "corner" the market, though at the same time production has gone on steadily increasing. The customs revenue, however, shows a large increase, though how much of this is due to enhanced values it is difficult to say. In the absence of complete and trustworthy statistics it is impossible to form any accurate opinion as to the trade of the whole empire. The official reports, as complete as they ever appear, are always from three to five years behind, and the customs returns from the provinces are both irregular and confusing. They are neither accurate nor uniform. Taken all together, the customs receipts of last year will show a large falling off from the two or three preceding years. The causes

are political, financial, and industrial. For the past three or four years the state of business has been steadily going from bad to worse. The long-credit system gave facilities for transacting business long after the interior became really insolvent, and thus postponed the crash. Recently, however, the importers have begun to realize the extra-hazardous character of this system of long credits, and have, therefore, been steadily cutting them down. Five years ago a "cash" house (and "cash" here means five or six months' credit) was the exception; now the long-credit house is the exception, and business is being reduced to a cash basis as rapidly as outstanding credits will permit. This step, however, was postponed too long, for the outstanding credits are still enormous, and the interior is practically bankrupt.

Three years ago great difficulties were encountered in making collections in the provinces. There was very little money afloat, the masses were earning nothing, and everybody was in debt. This state of affairs was principally due to the bad management and extravagance of the large coffee and sugar planters, upon whose industries nearly the entire business of Central Brazil depends. Demoralized by the pernicious influences of African slavery, and recklessly over-confident because of the prosperity enjoyed by the cotton-planters during the years of high prices caused by the American civil war, and by the coffee-planters from 1871 to 1873, the great proprietors of the country plunged headlong into extravagant expenditures.

The foreign-trade movement in Brazil is officially given as follows:

YEAR.	Import.		Export.	
	Milreis.		Milreis.	
1879-'80	277,898,900		318,337,100	
1880-'81	259,412,000		309,131,000	
1881-'82	275,541,600		300,190,900	
Average	270,949,100		307,556,800	

The ensuing table shows the coast wise trade:

IMPORT AND EXPORT IN MILREIS.	
1879-'80	190,712,800
1880-'81	155,843,600
1881-'82	174,899,400
Average	170,485,900

Trade of the United States with Brazil.—The import of merchandise and specie into the United States from Brazil during the fiscal year ended June 30, 1883, was \$44,483,459, the domestic export from the United States to Brazil was \$9,159,330, and the re-export of foreign goods and specie thither was \$92,764. The principal imports from Brazil into the United States during the fiscal year ended June 30, 1882, consisted of coffee, 815,465,986 pounds; cocoa, 1,456,665 pounds; horse-hair, 690,770 pounds; India-rubber, 11,848,618 pounds; sugar, 228,688,898 pounds; wool, 498,505 pounds, and hides represented by a value of \$1,445,541. The total import of Brazilian merchandise was \$43,801,878.

The export of domestic goods from the United States to Brazil in the same year comprised the ensuing chief items: Flour, 618,908 barrels, worth \$4,546,224; cotton goods, 6,993,979 yards, worth \$709,756; iron and steel manufactures, \$711,090; petroleum, 5,478,525 gallons, worth \$668,575; lard, 3,698,462 pounds, worth \$491,252; soap, 2,578,458 pounds, worth \$184,788, and lumber and wooden-ware, \$355,628, the total domestic export summing up \$9,085,452. Re-export of foreign goods thither, \$117,110.

The Rise in Coffee in 1883.—Fair Rio coffee stood in the New York market at 8½ cents on January 1, 1883; on November 21st it had advanced to 12¼ cents. The gradual improvement in the value of coffee had begun in all consuming countries as early as October, 1882, when good ordinary Java had declined in Holland to the lowest ebb it had reached since 1848, say 25 centimes per half kilogramme; on November 20, 1883, it had advanced in Rotterdam to 33 centimes, the total rise in that market thus having been 32 per cent., while the improvement in Rio coffee in the New York market had been, as shown above, about 50 per cent. This greater advance in Brazil coffee in the leading American markets as compared with the advance in the leading European market in Java coffee, was due to the fact that

Brazil had a short crop in 1883. In part it was also due to a more active speculative movement in New York and Rio than in Holland and Europe generally, in this staple article of consumption.

In 1882 there were fifty cotton-mills in operation in Brazil, having 2,805 looms and 77,828 spindles, employing 3,082 operatives, and having a capital invested of 8,682,000 milreis. They produced 22,076,000 yards of goods.

Cattle-raising.—The southern portion of the province of Rio Grande do Sul is the best suited for stock-raising. Land in this locality is difficult to obtain, it being generally hereditarily transmitted. Should it, however, come upon the market, the owners of adjoining property will make almost any sacrifice to obtain it rather than have a stranger settle in the neighborhood. Land is worth from \$10 to \$20 for each braça of frontage by 2,000 braças deep (a braça is 7 feet 2½ inches). Stock-cattle are worth, one with the other, \$5 to \$6; for butchery they bring from \$2.50 to \$18. They are generally sold at the breeding-grounds, as the means of transportation are of the most primitive kind and the cost large. The slaughter last year amounted to 260,000 head, against 275,000 the year before.

Rio Grande's Hide-Shipments to New York.—The following tables show the proportion of import of hides and kips into New York from Rio Grande, as compared with other sources of supply:

	1882.	1881.	1880.

Total.....	2,819,522	2,574,522	8,239,599

Brazilian Woods.—Some investigations by M. Thanneur show that Brazil is rich in woods for engineering purposes. The "yandubay" is exceedingly hard and durable; the "courupay" is also very hard and rich in tannin; the "quebracho" is, however, more interesting than any, and grows abundantly in the forests of Brazil and La Plata. It resembles oak in the trunk and is used for railway-sleepers, telegraph-poles, piles, and so on. It is heavier than water, its specific gravity varying between 1.208 and 1.338. The color at first is reddish, like mahogany, but grows darker with time. Being rich in tannin, it is employed for tanning leather in Brazil, and recently has been introduced for that purpose into France. A mixture of one third of "quebracho" and two thirds of ordinary tan gives good results.

Diamond-Mining.—The discovery of the first deposits of gold in the province of Minas-Geraes, the most productive in Brazil, led to the search for diamonds as early as the close of the seventeenth century, the first being found at Serro. The fever spread, and moving northward into virgin country founded the village of Tijuco, the Diamantina of to-day, the center of diamond-mining in Brazil. M. A. de Bovet, professor at the School of Mines of Ouro-Preto, Brazil, has recently, in the "Annales des Mines," Paris, published an exhaustive account of a visit to that section. Diamonds are found in the provinces of Minas-Geraes, Bahia, Paraná, Matto-Grosso, and Goyaz. In Minas they are mined at Diamantina, Grão Mogol, Bagagem, Conceição, Cocães, and other points, the first named, however, being the most important. Diamonds are found in a rounded gravel, having peculiar characteristics, which is called by the miners "cascalho." It is a mass of small pebbles, chiefly quartz, mixed with very little clay. If examined with care it will be found to contain a large number of minerals, many of which are present in the cascalho from all the districts.

BRIDGES. See ENGINEERING.

BRITISH COLUMBIA. This, the most western province of Canada, extends from the United States on the south to the Northwest Territories on the north, or from the forty-ninth to the sixtieth parallel of latitude, and from the Pacific ocean on the west to the main ridge of the Rocky mountains, as far north as parallel 54°, and thence to the sixtieth parallel along meridian 120° W. on the east.

Area and Population.—British Columbia is in its infancy. With a territory of 341,000 square miles, it had in 1881 a population of only 49,459, of whom 4,850 were Chinese, and 25,661 Indians. Victoria, the capital, is on the southern end of Vancouver island, on the straits of Juan de Fuca. Its population is 6,000. There are no other towns of note. The chief villages are: Esquimalt, near Victoria; Nanaimo, on the Gulf of Georgia; New Westminster and Port Moody, near the mouth of the Fraser;

Hope, Yale, Lytton, Kamloops, Lilloet, Richfield, Cariboo, and Quesnel, in the Fraser valley, and Cassiar, in the northern part of the province.

Geography.—The Rockies run in three nearly parallel chains, although in some localities they almost unite. Between these ranges are rough valleys, or narrow plateaus containing small tracts of arable land, besides larger areas suitable for grazing. Its timber is chiefly the far-famed Douglas pine, though in many localities, especially along the mainland and Vancouver island shores, the sturdy hard-woods are found growing to a considerable size. Between the Rockies and the Cascades or Coast-range, is

a broad, irregular plateau nearly one hundred miles in width, forming another district of "oases." In its valleys are found slopes, openings, and expansions, such that while, on the one side, grass grows luxuriantly, and oats, barley, and wheat ripen, on the other the ice is packed in the gorges throughout the year. But as rain falls very rarely on this plateau, the ice is of value in supplying moisture necessary to mature fall wheat and other grains.

Meteorology.—The following table, illustrating the temperatures and rainfalls of some of these plateau valleys, compared with Esquimalt on the straits of Juan de Fuca, is from official reports of the Canadian Government:

LOCALITIES.	Temperature.				Clouded sky.	Total annual precipitation.	Mean highest temperature.		Mean lowest temperature.		Absolutely highest temperature.	Absolutely lowest temperature.	Mean annual range.
	Deg.	Deg.	Deg.	Deg.			Deg.	Deg.	Deg.	Deg.			
Esquimalt.....	48.43	57.98	39.46	39.17	53	38.41	80.1	17.2	85	8	62.9		
Plateau, inland.....	47.79	68.41	36.01	39.84	46	10.10	98.8	-9.4	105	-29	108.2		

The cause of the dry climate of the plateaus is found in the wide and high Coast-ranges, which intercept the moisture of the westerly winds. It may rain for several days over the western slope of these mountains, while not a drop falls on the eastern, only fifty miles distant. The clouds fly eastward, but appear incapable of forming rain. However, on the Gold and Selkirk ranges of the Rockies rain falls abundantly.

Along the mainland shore and on Vancouver island are many large tracts of land admirably suited for farming, and toward the head of the Fraser and in the Thompson valley many agricultural and grazing farms are established.

Forests.—The plateau valleys and the plateaus are, as a rule, thinly wooded, although the Douglas pine and various hard-woods afford supplies far in excess of the present or the prospective demands. On the coast, and in Vancouver, however, the trees are of an enormous size, rivaling the giant pines of California.

Minerals.—The province abounds in minerals, the most precious and valuable having already been found in paying quantities. It was only in 1857 that the first gold was discovered in British Columbia. The gold is found in nuggets, three brought forth in 1877 being worth \$40, \$90, and \$180, respectively. In other places it is found in thin scales, the rocks in all such cases being igneous. Hitherto gold-mining has been conducted in the primitive way, washing the sand or gravel of the streams, and collecting the proceeds. In places a lucky miner averages \$20 to \$100 a day; but, as the claims are small, good luck does not last long. From experiments conducted in San Francisco, it seems there are localities where the quartz yields 1.21 ounce of gold, 2.48 ounces of silver, and several pounds of copper to the single ton. Some specimens of silver-ore have yielded \$300 a ton,

but ordinary specimens furnish 8.25 ounces of silver and .6 ounce of gold. Native silver pellets have often been found, but in isolated localities. Copper is found in rich veins in several places already, and also in ores. It occurs in a native state in the Thompson river district.

Coal.—Coal is very abundant. The extensive fields of Nanaimo or Vancouver are worked, while many others on the mainland are awaiting development. The following are the exports of coal mined in British Columbia for the year 1882:

DESTINATION.	Tons.	Value.
To United States.....	188,756	\$683,535
To Sandwich Islands.....	12,170	40,807
To China.....	5,670	19,845
To Mexico.....	2,960	12,860
Total.....	210,556	\$718,147

During the same year British Columbia exported to the United States \$728,225 worth of gold-quartz.

Education.—The system of free public education was established in British Columbia in 1872. During the first ten years of their existence the total expenditure for public schools amounted to \$490,895. Up to the end of 1882 only 50 school-houses had been erected, and provision was made for 64 teachers for 1883. The number of pupils enrolled in 1882 was 2,653, with an average daily attendance of 1,359. There is one high-school in the province, with a registered attendance of 74. The education department is presided over by a chief superintendent, who acts under the direction of the Lieutenant-Governor in Council, through the Provincial Secretary. The individual schools are controlled by school boards, consisting of three members each, who are elected by resident male freeholders and house-

holders. The compulsory clauses of the school law require every child between the ages of 7 and 12, inclusive, to attend school for at least six months in the year. The penalty inflicted on the parent or guardian for non-compliance is \$5 for the first offense, and \$10 for each subsequent conviction.

BULGARIA, a principality created by the Treaty of Berlin, signed July 13, 1878, out of a portion of the Christian provinces of Turkey. The treaty provided that it should be an autonomous principality, tributary to Turkey, and under the suzerainty of the Sultan, with a Christian government, a prince elected by the people, and a national militia. By unanimous vote of the Constituent Assembly, Prince Alexander of Battenberg, brother of the then Emperor of Russia, and grand-nephew of the German Emperor, was elected hereditary prince as Alexander I, April 29, 1879. The Constitution of 1879 vests the legislative authority in a single Chamber, the *Sobranje*, or National Assembly, elected by universal suffrage in the proportion of one deputy to every 10,000 inhabitants, and gives the Prince power to appoint additional members not to exceed half the number elected by the people. The duration of the National Assembly was fixed at four years, but the Prince could dissolve it at any time and order new elections. The Constitution was suspended by Prince Alexander in 1881, who dissolved the National Assembly, and, by despotic use of the military power and falsification of the returns, procured the election of a Grand National Assembly, the body intrusted with the power to make changes in the Constitution, which, by a vote of July 13, 1881, clothed the Prince with autocratic legislative, and executive powers for seven years.

Statistics.—The area of Bulgaria is estimated at 24,860 square miles. The population, as returned in the census of Jan. 1, 1881, was 1,998,983, of whom 1,023,730 were males and 975,253 females. As regards religion, 68·8 per cent. were Christians, 30·7 per cent. Mohammedans, and 0·5 per cent. Israelites; in respect to nationality, 66·7 per cent. were Bulgarians, 30·6 per cent. Turks, 1·8 per cent. Roumanians, 0·5 per cent. Greeks, 0·5 per cent. Israelites, 0·3 per cent. Germans, and 0·1 per cent. of other nationalities. In 1883 the emigration of the Mohammedan element recommenced on a large scale. The capital, Sofia, contained 20,541 inhabitants; Rustchuk, 26,867; Varna, 24,649; Shumla, 22,921. There were nine other towns of over 10,000 inhabitants. The main occupation of the people is agriculture. The exports of grain are about 1,500,000 tons per annum. Other articles of export are wool, tallow, hides, and timber. Coal and iron mines exist, but are almost entirely undeveloped. There is a railroad between Rustchuk and Varna, 140 miles in length.

Army.—The army has been the subject of particular attention on the part of Prince Alexander. In order to increase the reserve ar-

my as rapidly as possible, the period of service with the colors is only two years, instead of four. The army was trained by Russian officers, who fill most of the superior commands. Bulgarian officers have been educated at the Military Academy at Sofia to take their places as speedily as practicable. The number of Russian officers in 1882 was 876. In the autumn of 1883 there were 185 Russian officers still on the lists, and 400 of Bulgarian nationality. The total strength of the army was 16,500 men.

Political Review.—Prince Alexander, when by a state-stroke he abolished representative government, placed himself under the direction and tutelage of the Russian court. He soon found that his Russian mentors would give him no chance to exercise his statecraft, but pursued aims which were more in harmony with the ideas of the Radical party which he had expelled than with his own. The *coup d'état* placed it in the power of the Russians to strengthen their grasp upon the country. Alexander had made his cousin, the Russian Emperor, the arbiter between himself and his subjects, expecting when endowed with autocratic power to guide the policy of the country by balancing the interests of Russia and Austro-German interests against each other, and thus secure the independent position guaranteed by the Treaty of Berlin. Instead of the personal government at which he aimed, he was forced to submit to the dictation of Russian guides who sympathized with the Panbulgarian and radical ideas of the popular party which they had aided the Prince in excluding from the seats of government with the bayonet. Zankoff and Balabanoff, the Radical leaders, from their near place of exile in Eastern Roumelia, and in clandestine visits in the country, were able to carry on a lively agitation for the overthrow of the Prince. Hitrovo, the Russian consul-general, who had planned the arrangements of the *coup d'état*, and many of the Russian officers, openly fraternized with the Prince's enemies. Kryloff, the Russian general, who was Minister of War, refused to issue an order forbidding officers of the army to take part in these antagonistic demonstrations. Alexander journeyed to St. Petersburg, and threatened to lay down the crown if he was obliged to submit to such indignities, whereupon the Emperor recalled the obnoxious officials, and gave the Prince for advisers Generals Soboleff and Kaulbars, who were supposed to be free from Panlavistic tendencies, admonishing him at the same time to be sparing in the exercise of his autocratic powers.

The ministry which was formed in July, 1882, consisted of Gen. Soboleff, Premier and Minister of the Interior; Gen. Kaulbars, Minister of War; Natshevich—a Bulgarian, whose appointment as Minister of the Interior a year before in the place of the Russian Lieut.-Col. Remlingen, who was dismissed, had provoked angry menaces from Hitrovo—Minister of Fi-

nance; Vulkovich, Minister of Public Works and Minister of the Exterior *ad interim*; Grekoff, Minister of Justice; and Tesharoff, Minister of Education. The new National Assembly, a simply consultative body, contained 80 members, elected by the indirect system.

The Conservative party became gradually imbued with the same jealous distrust of Russian supremacy which the Liberals professed. The latter represented the sentiments of the bulk of the population, among whom gratitude toward their Russian deliverers, and affinity for the popular ideas agitating Russia in contradistinction to the ideas of liberty and reform which prevail in Western Europe, co-existed with a jealous spirit of resistance to the domination of the Russian Government.

The Russian generals worked for a time in harmony with their Conservative colleagues. But in January, 1888, a difference arose regarding the projected line of railroad from Sofia to Rustchuk. On their insistence, Vulkovich retired from the ministry, being succeeded by Stoiloff, a man of similar patriotic Bulgarian sentiments. The pretext for the dismissal of Vulkovich was the action of the Government in the matter of a Radical demonstration, for which action Soboleff was himself chiefly responsible. Zankoff, who had been kept in prison for many months, was a few weeks before allowed to leave the country. He returned to Rustchuk, and was received with public manifestations of sympathy. The demonstration was suppressed by the prefect. The Government, trying to satisfy all parties, dismissed the prefect and reimprisoned Zankoff. Other subjects of dispute arose, particularly the question of employing the civil power to execute a disciplinary decree pronounced against Miletius, Archbishop of Sofia, by the Bulgarian Synod. Soboleff acquiesced in the forcible seclusion of the prelate, but fearing the effect in Russia, where the act might be construed as an indignity committed upon a high dignitary of the Holy Orthodox Church, threw the blame upon his colleagues. In March, Stoiloff, Gregoff, and Natshevich sent in their resignations. A working Cabinet was formed, in which a Russian, Prince Hilkoff, was given the Ministry of Public Works, and other Russians or partisans of the generals the other posts. The rupture between the Conservatives and the Russian ministers became complete. When the Prince went to Moscow to attend the coronation of the Emperor, after first visiting the Sultan at Constantinople and stopping at Athens, he found there a deputation from the National Assembly, a deputation of Liberals, and his two Russian ministers, all desirous of laying their grievances before the Emperor. When, after the ministerial crisis in March, the Russian generals took the government of the country entirely into their own hands, they found themselves isolated. The contracts which they distributed among Russians rendered them unpopular. They rejected

the authority of the Prince, and represented at St. Petersburg that constitutional government ought to be restored. They approached the Radicals, who demanded the restitution of the constitution of Tirnova. The Prince, who submitted tamely to the open insubordination of the Russian ministers, resisted the return to regular government, because he would not govern with a Radical ministry and Assembly.

The only hope of emerging from the lawless condition under which the country suffered, with no sovereign power capable of exercising authority, was by a compromise and fusion of the two warring political parties. The Russian emissaries were under standing orders to bring about a return to a constitutional *régime* as the chief part of their task. The Liberal leaders were recalled from exile, and in August they held consultations with the chiefs of the Conservative party. Their demand for the convocation of a Grand Sobranje, for the re-establishment of the constitution of Tirnova, was unacceptable.

The Russian Government sent M. Jonin as extraordinary ambassador to direct the settlement of the question of the Constitution. Prince Alexander quarreled outright with his chief minister, and attempted to dismiss him and form a ministry of Bulgarian Conservatives. The Russian generals thereupon showed the Prince orders from the Emperor not to leave the country, even at the Prince's command. Jonin then presented an ultimatum, demanding that the Prince should lay down his autocratic powers, call a Great Sobranje within six months, for the adoption of a Constitution, and in the mean time leave the administration entirely in the hands of the two generals. Alexander finally complied with the demand by issuing a manifesto on Sept. 11th, announcing the appointment of a commission to elaborate a Constitution which would be laid before a Great National Assembly.

The Prince, in order to avoid the humiliation of resigning the sovereignty to the Russian agents, made up his mind at last to come to terms with the Liberal party. Zankoff and Balabanoff, on behalf of the Liberals, and Natshevich and Grekoff, the Conservative leaders, effected a compromise, whereby the constitution of Tirnova was restored by proclamation, subject to revision by the Great Sobranje, but the legislative powers were to be exercised by the extraordinary Sobranje elected in December, 1882, as to some extent they virtually had been all along, instead of by a new Sobranje elected under the old Constitution. This course was urged in a resolution of the National Assembly in which both parties united their votes. By this turn of affairs, General Soboleff was taken by surprise, and rendered powerless. The entire episode was prearranged by the Prince and the political leaders, all parties suddenly sinking their differences for the purpose of escaping the dictation of the obnoxious Russian agents. Giving the anomaly of gov-

erning under the Constitution with a National Assembly not constitutionally elected as their ground, the Soboleff-Kaulbars ministry, consisting of the two generals, Burmoff, Agura, Prince Hilkoﬀ, and K. Zankoff, handed in their resignation, Sept. 19th. Stoianoff, whom the Prince had insisted on placing in charge of the Ministry of Justice, in opposition to the Russians, did not sign the paper. A Bulgarian ministry was formed, with Drogan Zankoff at the head, the man who had passed the last two years in prison and in banishment, and had visited Bulgaria only by stealth to agitate for the deposition of the Prince. Stoiloff received the portfolio of Justice.

Over the nomination of a Minister of War, Prince Alexander was again involved in strife with the Russian diplomatic representative. With both the political parties at his back, their fierce rivalries reconciled by the national danger of sinking into a Russian dependency, he was emboldened to refuse both the officers given to him to choose from, and select Gen. Lessovoy for the position. But the admonitions of M. Jonin caused him to yield the point, and accept Lieut.-Col. Redigher. A spirited contest over the control of the army ensued. Soboleff and Kaulbars had succeeded in gathering a party with Panslavistic tendencies, a part of whose programme was the confederation of the Balkan states. This party was now stronger, and carried on an active opposition to the Prince under the encouragement of Jonin and the leadership of Karaveloff, a more extreme and consistent Radical than Zankoff and his associates.

Alexander, in his disputes with the Russian agents, had several times received the hint that he might lose his throne. Suggestions had

been thrown out to the people that Prince Waldemar of Denmark, brother of the Empress of Russia, would make a popular ruler. The Russian agents succeeded in throwing Prince Alexander into a dangerous passion by the recall to Russia, without warning, of Adjutant-Gen. Lessovoy, and another officer. The Prince discharged every Russian officer on his staff, and, when Col. Redigher refused to carry out the order, he took away his commission and demanded the resignation of his portfolio, threatening, in case he refused, to have him conducted across the frontier. The Russian Government did not resent it, but secured a more definite control over the Bulgarian army. The Bulgarian Government arrived at an understanding with Baron Kaulbars, the Emperor's aide-de-camp, and accepted a convention, signed for three years, whereby the Bulgarian Minister of War is to be appointed by the Prince, subject to confirmation by the Emperor. Russian officers are not allowed to accept civil appointments, nor to take part in political affairs, and are subject to the Minister of War, who is answerable to the Russian diplomatic representative.

Legislation.—The Sobranje, after receiving legislative authority, immediately applied itself to the settlement of the debt to the Russian Government for the cost of the occupation, and to the railroad convention with Austria. This convention (see AUSTRIA), though opposed by the Russian representatives, could not well be avoided, as it was an affair of the European concert. The terms for the payment of the indemnity for the Russian occupation in the Turkish War, amounting to 10,618,250 paper rubles, were settled by a treaty entered into with Russia.

C

CABLES, INTERNATIONAL PROTECTION OF SUBMARINE. When the first attempt to lay an Atlantic cable was made in 1864, France, Brazil, Hayti, Italy, and Portugal entered into an agreement recognizing the neutrality of the cable; and accepting the obligation not to injure or destroy it, even for military purposes, in the event of war. This treaty fell through with the cable project. In 1869 the United States Government called a conference at Washington, to consider the international relations of the ocean telegraphs and their regulation in war and peace. The American Government prepared a project which provided for the protection of the cables and their neutrality in war-time; but the outbreak of the Franco-German war prevented the meeting of the conference. In 1871 Cyrus W. Field submitted a similar proposal to the conference in Rome, and the Italian ministry undertook to lay it before the European governments. Only one answer was received, a favorable one from the Austrian Government.

Confidential inquiries proved it to be out of the question to expect the majority of the powers to agree to the inviolability of the cables in time of war. The Institute of International Law accepted the situation, in discussing the matter at their meeting at Brussels, in 1879, and proposed a treaty to provide for the arrest and punishment of persons who injure cables on the high seas, and the neutralization of cables running between neutral countries. They proposed that persons suspected of injuring a cable should be subject to arrest by naval vessels of any of the powers, but that they should be brought to trial in the country of the vessel on which they are taken. They also suggested that measures taken to interrupt cable communication in war-time should not extend, unless it should be unavoidable, to the injury of the cable; and if it does, that the same government should repair the damage when peace is restored.

In 1881 several cables were badly injured

in the North Sea. The English subjects who were interested appealed to their Government to secure reparation, but their request was received coldly. The conference held at the Hague in 1881 for the regulation of the North Sea fisheries, in which the Netherlands, Germany, France, Great Britain, Belgium, Sweden, and Denmark took part, adopted a resolution recommending the governments to take measures to prevent the injury of submarine cables by fishermen.

When this question came up at the Electrical Congress at Paris, in 1881, the French Government proposed a conference for the discussion of the subject. The conference met Oct. 16, 1882, in Paris. Representatives of France, Austria, Germany, Great Britain, Italy, Russia, the Netherlands, Belgium, Denmark, Switzerland, Turkey, Norway, Sweden, Spain, Portugal, Greece, Serbia, Roumania, the United States, Colombia, British India, Japan, China, Mexico, Nicaragua, the Argentine Republic, and Costa Rica were participants. The conference confined itself to the subject of the protection of cables in time of peace. After long deliberations, a compromise project was adopted. Any person who intentionally or through criminal negligence injures or breaks a submarine cable, is declared an offender against the law. The courts of the country to which the vessel belongs upon which the illegal act is committed, are to have jurisdiction of the offense.

CALIFORNIA. State Government.—The State officers during the year 1888 were the following: Governor, George Stoneman, Democrat; Lieutenant-Governor, John Daggett; Secretary of State, T. L. Thompson; Treasurer, W. A. January; Comptroller, John P. Dunn; Superintendent of Public Instruction, W. T. Welcker; Attorney-General, C. E. Marshall; Surveyor-General, H. I. Willey. Judiciary: Supreme Court—Chief-Justice, Robert F. Morrison; Associate Justices, M. H. Myrick, E. W. McKinstry, E. M. Ross, J. D. Thornton, J. R. Sharpstein, S. B. McKee.

Legislative Session.—The Legislature, consisting of 80 Democrats and 10 Republicans in the Senate, and 58 Democrats, 21 Republicans, and one Independent in the House, met on the 8th of January and adjourned on the 18th of March. Among the measures passed were the following:

Bills in aid of the State University; the road law; concerning tax-sale redemptions; classifying municipal corporations; providing for a preparatory course for the university in the common-school system; a new and good street law; in aid of decrepit veterans of the Mexican War; in aid of foundling asylums; in aid of viticulture; in aid of horticulture and the destruction of fruit insect-pests; protecting food-fish; settling contests as to preferred labor claims; providing for a wall at the Folsom Prison; a fair municipal government bill; giving boards of health control over drainage-fittings for houses; a county government bill, about equally balanced between good and ill provisions; in aid of silk-culture; to prevent the introduction of contagious diseases into the State;

providing additional accommodations for the insane; requiring the insane with sufficient estates to pay for their care; giving a fit salary to the Clerk of the State Board of Equalization; providing for better investment of school moneys; aiding the State Agricultural Society; aiding the Mining Bureau; paying some just claims; aiding the industrial education of the deaf and dumb and the blind; providing for the care and repair of State buildings, and aiding State normal schools; and submitting the text-book question to a vote; some few amendments to the Code, of no particular significance, the best being a new provision for authentication of marriage; the repeal of the Sunday law; the oleomargarine bill; the Statistical Bureau bill; the street railway-ticket bill; the Lake Tahoe forestry bill, limited to a small region, and hence tending to prevent general remedies being applied; the legislative and congressional partisan apportionment bills; the bill legislating out of office Republican Harbor Commissioners; vacating a judicial office in Mono instead of impeaching the incumbent; the hair-cutting bill for county prisoners; for the destruction of wild animals; as to refunding the indebtedness of cities; auditing the accounts of the Insurance Commissioner; the jurisdiction of justices; as to juvenile offenders; as to the method of submitting constitutional amendments; as to drawbridges in cities; purchasing portraits of Governors; as to the manner of assessing railroad property.

The following are the new congressional districts: 1st—Del Norte, Humboldt, Trinity, Siskiyou, Shasta, Modoc, Lassen, Plumas, Sierra, Tehama, Colusa, Mendocino, Lake, Sonoma, and Napa counties; 2d—Butte, Sutter, Yuba, Nevada, Placer, El Dorado, Amador, Calaveras, San Joaquin, Stanislaus, Merced, Tuolumne, and Mariposa; 3d—Yolo, Sacramento, Solano, Contra Costa, Marin, and Alameda; 4th—part of San Francisco; 5th—part of San Francisco, and all of San Mateo, Santa Cruz, and Santa Clara; 6th—San Benito, Monterey, San Luis Obispo, Santa Barbara, Ventura, Kern, Los Angeles, San Diego, San Bernardino, Alpine, Tulare, Fresno, Mono, and Inyo.

The Governor's Views.—Gov. Stoneman was inaugurated on the 10th of January. In his address he expressed the following views regarding the regulation of freights and fares, the Sunday law, the Chinese question, prison reform, and irrigation:

Three years have now elapsed since the people solemnly expressed their views upon the subject of the regulation of fares and freights, and delegated to a commission, chosen under the new organic law, the authority to execute their expressed will. It is to be deeply regretted that the retiring Railroad Commission has entirely neglected and refused to take any positive steps toward enforcing its powers. It is to be earnestly hoped that the incoming Commission will prove to be composed of men of sufficient courage and sagacity to meet this issue in a spirit of fairness; to deal justly by the transportation companies and candidly by the people. I wish it to be distinctly understood that all the power and influence of the Executive department of the government will be cheerfully exercised on behalf of the commission to bring the issue between the people and the transportation companies to a final and satisfactory termination. The question of the regulation of fares and freights is the great living issue of the day, and no postponement of its solution to a future time will prove satisfactory either to the people of this State or the Union. The question of the power of the State to fix and regulate the charges for fares and freights upon transportation lines within the State has passed beyond the line of

legitimate argument. As to the policy of enforcing the power of the State to regulate fares and freights there can not, since the result of the late election, be further doubt.

Sumptuary laws are and ever have been opposed to Democratic teachings, and find no support among liberal-minded people. For many years sections 299, 300, and 391, of the Penal Code, commonly called the "Sunday law," have been on our statute-books. Under slightly varying forms this law has been in existence in this State during the major portion of the past quarter of a century. Now and then spasmodic efforts have been made to enforce it, but without success. In every contest before the courts the condition of public opinion has been shown by the fact that the law has been practically placed on trial, and not the particular defendant at the bar. In cases where the testimony adduced has been conclusive that the alleged offense has been committed, juries have almost uniformly refused to convict—a state of facts never before observed with reference to any other portion of our criminal jurisprudence. Such is the condition of the sections above cited. It is unwise to encumber the statute-books with an enactment which experience has proved can not be enforced. The result at the late election is an emphatic indorsement of the attitude of the now dominant party on this important subject, and our duty in the premises is perfectly clear. We all concede that those sections of our Codes which provide for certain holidays and non-judicial days are essential to happiness and health. The repeal of the "Sunday law" will in no wise interfere with the permanency or effect of our civil legislation in the matter of a day of rest. Nor is there any disposition to disturb those penal enactments which are intended to protect religious assemblages from all unseemly interference.

Within the past year Congress has granted to the people of this coast partial relief from the much-deplored evil of Chinese immigration. There are some who affect to believe this important question finally settled by the statute referred to. There are those who evince a desire to nullify its effect by a loose construction of its terms and an inefficient execution of its provisions. The law had hardly taken effect when another bill was introduced into the Senate of the United States, and I believe is now pending in that body, under which many thousands of Chinese now serving under labor contracts in the West India islands might be permitted to cross the territory of the United States to their homes in the Chinese Empire. Considering that we have no power to deport the Chinese, if they were once permitted to land in this country, they might remain here permanently. Against this new danger the people of this coast will depend upon their representatives in Congress to guard.

The congregate system of imprisonment, which, owing to the peculiar construction and want of cell-room in our prisons, is necessarily in vogue therein, is, in my opinion, not conducive of the moral well-being of the prisoner. The most important object of penal confinement ought to be to effect a reformation of the prisoner. I would respectfully recommend that, if practicable, a system of isolation and solitary confinement be instituted among those of the most vicious character. In the absence of such a system of isolation, San Quentin Prison, from its geographical position, might be made a distributing prison. All convicts should be sentenced to that institution in order that they may be registered and graded, the prison directors selecting those for distribution to Folsom and any other branch prison hereafter established. After careful study and examination of past records, the comparatively good should be retained and the vicious and incorrigible confined at another prison, so far as the interests of the State may permit. This system, strictly carried out, would form a perfect record of the antecedents and disposition of all convicts within the State. This system is not only essential

for the good of the prisoner and for the guidance of the directors, but would enable the district attorneys of each county to be always able to procure a complete record to embody in their information or indictments the number of convictions of each defendant, if any such there be, as they are now compelled by law to do under what is known as the "Prior-Conviction Act."

In a large portion of the State, agricultural interests are being developed by the aid of irrigation. The history of all countries dependent upon irrigation shows that this practice has necessitated the enactment of laws especially designed for the protection and regulation of irrigation, the maintenance of order, equity, and economy in the appropriation and use of waters, and that the subject has been one of the most difficult to deal with in legislation. Our own experience, limited though it be, is sufficient to establish this fact, as our courts are crowded with litigation growing out of irrigation practices, which constitute a serious drawback to our prosperity.

FINANCES.—The receipts for the thirty-second fiscal year (1881) were \$4,751,573.66, and for the thirty-third fiscal year (1882), \$4,698,654.41. Of these, for the thirty-second year, \$3,686,008.23, and for the thirty-third, \$3,685,367.60, came from property-taxes; and from poll-taxes, for the thirty-second year, \$316,869.48, and for the thirty-third year, \$248,816.80.

During the two years the disbursements on account of the State were:

FUNDS.	Thirty-second fiscal year.	Thirty-third fiscal year.
General	\$2,243,567 88	\$1,528,626 28
School	1,797,812 51	1,858,379 98
State school land	98,690 56	8,525 51
Interest and sinking	314,745 00	310,555 83
University	71,500 25	81,495 50
Consolidated fund, University ..	38,500 00	12,000 00
State Library	11,859 88	5,980 47
Supreme Court Library	2,578 40	1,914 25
Election reward	200 00
Condemnation	8,000 00
State drainage construction	287,948 61
Harbor improvement	482,854 79	165,248 07
Mining Bureau	11,780 00	10,700 00
Indian War bond	218 73
Construction fund, Drainage		
District No. 1	76,046 45
Levee District No. 5	14,740 00	10,240 00
Funded debt of 1873	99,000 00
Total	\$5,385,613 56	\$4,418,362 13
Less general fund warrants issued and canceled during the thirty-second fiscal year	721 00
Total	\$5,384,891 56	\$4,418,362 13

For the thirty-second year the disbursements exceeded receipts \$633,817.90, but for the thirty-third year the receipts exceeded disbursements \$280,292.28. The Comptroller says, "The natural inference to be drawn from the fact that in any one year the disbursements exceeded the receipts, is that the finances of the State were not in a healthy condition, but this would be unjust, as such disbursements were made from not only incoming moneys, but from moneys accrued in previous years to the funds where the discrepancy occurs."

It cost \$16,101.90 to carry convicts to prison in the thirty-third fiscal year, and \$22,500 for transportation of insane patients to the asylums.

The following tables show the assessed values of the several classes of property in the State for the years 1881 and 1882 respectively:

ASSESSED VALUES OF PROPERTY FOR 1881.

Value of real estate.....	\$348,869,816
Value of improvements on real estate.....	115,218,041
Value of personal property, exclusive of money..	146,180,978
The amount of money.....	18,597,566
Value of railroads operated in more than one county.....	84,829,664
Total.....	\$688,691,059

TAX-RATE FOR 1881.

For general fund.....	37 7 cents—	\$2,190,084
For school fund.....	23 4 cents—	1,800,000
For interest and sinking fund.....	5 4 cents—	815,000
Total.....	65 5 cents—	\$4,805,084

ASSESSED VALUES OF PROPERTY FOR 1882.

Value of real estate.....	\$381,908,198
Value of improvements on real estate.....	114,516,747
Value of personal property, exclusive of money..	130,848,458
The amount of money.....	13,702,056
Value of railroads operated in more than one county.....	27,602,818
Total.....	\$667,478,269

TAX-RATE FOR 1882.

For general fund.....	27 8 cents—	\$1,498,735
For school fund.....	24 8 cents—	1,800,000
For interest and sinking fund.....	7 5 cents—	898,000
Total.....	59 6 cents—	\$3,196,735

The counties paid to the State for taxes in 1881, \$4,230,075.68, and in 1882, \$4,144,659.98.

From other sources the State received, for 1881, \$52,497.98, and for 1882, \$558,994.48, making a total of all receipts from all sources for the thirty-second year, of \$4,751,578.66, and for the thirty-third year of \$4,698,654.41.

The amount of outstanding warrants, June 30, 1882, was \$286,749.69; balance in Treasury, \$1,016,021.77. On the financial condition of the State, Gov. Perkins, in his valedictory message, says:

The State has taxable property of the assessed value of about \$610,000,000. Her interest-bearing debt amounts to \$3,293,500. Of that debt the State owns, holding in trust for educational purposes, \$2,690,000. This leaves only \$603,500 of her bonds in private hands; and there is now in the Treasury, and provided for by taxes already levied, something more than \$500,000 applicable to their purchase or redemption. That showing is a good one for a Commonwealth that has expended within the past ten years more than \$4,000,000 upon public buildings, more than \$4,500,000 for charities, and more than \$2,000,000 for public education.

Within fifteen years our expenditures for educational purposes have increased from the annual average of \$275,000 to that of the current fiscal year—\$2,029,974; expenses, ordinary and extraordinary, have been met; permanent improvements of great value have been made; taxation has not been excessive, comparatively speaking, and the public debt has been steadily reduced.

During the present administration the ordinary expenses of government have been light, the extraordinary ones great. The public institutions have been ably and economically managed. The various offices have been efficiently filled and prudently conducted. The expenditures for all purposes have averaged \$4,244,038 annually. For the five years preceding, the annual average expenditure was \$3,633,902. The increased average expenditure yearly has been \$610,136. Such increase is owing in part to extraordinary appropriations made—and, in my opinion, wisely made

—for various purposes; but is owing mainly to our growth as a community, which has naturally necessitated greater outlay.

For charities, the annual expenditures were, for five years preceding this administration, \$483,870. The average for the past three years has been \$623,262. For public education, the average yearly outlay for the five fiscal years immediately preceding my inauguration was \$1,380,828. During my term of office, the average annual outlay for the same purposes has been \$1,788,948. The increased annual average, therefore, for these two items alone, amounts to \$592,865—which is within \$17,000 of the total increased average.

The State Board of Equalization was provided for under the Constitution for the purpose, in part, of effecting an equalization of the assessment of the property of the State. From the report of the board it would appear that it has not been able, through defects in the law, and decisions of the Supreme Court, in raising the assessment of the State to the true standard of value in money. Thus, while, exclusive of railroads, the assessment of 1880 exceeded that of 1879 in the sum of \$103,068,642, the assessment of 1881 and 1882 did not increase in the proportion which was expected from the known progress of the State in material wealth and industrial pursuits. The assessment of 1881 was below that of 1880 \$36,278,541. The assessment of 1882 shows a decrease below that of 1880 of \$55,158,105, and below that of 1881 of \$18,879,564.

I entered upon the duties of my office with deficiency bills amounting to more than \$218,000. A part of this sum was for increase in salaries of the judiciary, and expense of Railroad Commission and Board of Equalization, that were created by the new Constitution, and began life the middle of the fiscal year. The Legislature of 1880 appropriated \$414,000 more than it levied a tax to raise. Hence resulted the tax levy for 1881 of 65 5 cents as against that for 1880 of only 59 cents. The last Legislature paid all these accumulated debts; there was a falling off in the assessed value of property of \$51,000,000, and yet, as the result of prudent economy in outlay, the tax levy for 1882 was reduced to 56 6 cents; and to-day our public buildings are all in a most excellent state of preservation; and one of our prisons almost placed upon a self-sustaining basis.

California contributes \$190,000 annually to twenty orphan asylum societies toward the expense of caring for the children. The insane asylums cost \$458,000, and the State prisons \$450,000.

Viticulture.—The Board of Viticultural Commissioners has performed its labors with credit to itself and profit to the State. Established but three years, it has seen the increased plantation of from 50,000 to 60,000 acres of land in vines, which plantations were made mainly through the encouraging influence of this board, it being also instrumental in choice of the vines planted and the locations selected. The actual present value of these new plantations is over \$15,000,000, and the increased value by this reason given to the surrounding properties must be fully as much more. The impetus thus given to the plantation of vineyards still continues. The present plantations will yield the producers after the next vintage not less than six and a half million dollars per annum. There are now planted not less than 100,000 acres of vineyards, of which, probably, 7,000 are planted with the choicest of imported vines.

Election Returns.—The result of the election in November, 1882, was as follows: For Governor, Stoneman, Democrat, 90,724; Estee, Republican, 67,175; McDonald, Prohibitionist, 5,765; McQuiddy, Greenbacker, 1,020. All the State officers elected were Democrats. The Democrats also elected two Congressmen-at-large, four district Congressmen, three Railroad Commissioners (one in each district), and three members of the State Board of Equalization (first, third, and fourth districts). In the second district the Republicans elected the member of this board. The following is the vote for district Congressmen:

DISTRICT.	Democratic.	Republican.	Other.
First.....	22,788	14,847	656
Second.....	20,229	19,346	556
Third.....	21,807	19,478	1,266
Fourth.....	23,105	18,897	710

CANADA, DOMINION OF. The Dominion of Canada, the largest and in many respects the most important colony of Great Britain, comprises the greater portion of the North American continent lying north of the United States.

Geography.—Its boundaries are: on the south, the United States and the Great Lakes; on the west, from the Straits of Juan de Fuca, latitude 48°, to Dixon Entrance, latitude 55° N., in the

ada, when considered in degrees of longitude, its breadth in miles is only 3,200 from extremity to extremity, and from ocean-port to ocean-port, only 2,200. From Port Nelson, on Hudson bay, to the mouth of the Skuna river, in British Columbia, is only 1,860 miles.

The physical features of Canada, considered as a whole, are very regular. The northeastern coast-line is deeply indented by Hudson and James bays, while its eastern one is broken irregularly by the Gulf of St. Lawrence and the Bay of Fundy.

The lakes of Canada are detailed in the following table:

NAME.	Area in miles.	Depth in feet.	Latitude of center.
Nipigon.....	1,650	850	50°
Simcoe.....	800	704	44° 25'
Nipissing.....	550	684	46° 15'
Tomiscamingue.....	850	650	47° 15'
Champlain.....	567	93	44° 30'
St. John.....	500	50	45° 30'
Great Bear*.....	14,000	290	66°
Great Slave*.....	20,000	580	62°
Athabasca*.....	5,000	600	59°
Wollaston*.....	2,000	600	58°
Deer*.....	3,000	500	57°
Winnipeg.....	10,000	700	52° 30'
Winnipegosis.....	2,300	728	53° 30'
Manitoba.....	2,000	720	51°
Woods.....	500	977	49° 30'

Pacific ocean, and from Dixon Entrance to the Arctic ocean, in latitude 70°, the United States Territory Alaska; on the north lies the Arctic ocean; while on the northeast and east are Baffin bay, Davis straits, the Atlantic ocean, Labrador, Straits of Belle Isle, and the Gulf of St. Lawrence. Labrador, though part of the mainland, is under the administration of Newfoundland. Included within these boundaries are 3,370,000 square miles of land.

Notwithstanding the great breadth of Can-

The provinces of Canada are:

NAME.	Area in miles.	Population in 1881.	Capital of province.
Ontario.....	220,000	1,923,228	Toronto.
Quebec.....	188,000	1,359,027	Quebec.
New Brunswick.....	27,000	321,938	Fredericton.
Nova Scotia.....	20,000	440,573	Halifax.
Manitoba.....	123,000	65,954	Winnipeg.
British Columbia.....	841,000	49,459	Victoria.
Prince Edward.....	2,000	108,891	Charlottetown.

* Great Bear, Great Slave, Athabasca, Wollaston, and Deer are not properly surveyed yet, hence the areas, etc., are only approximate. They are all shallow.

(For details concerning the various provinces, see the articles under their respective names.)

Territories.—To the east of British Columbia lie the four new Territories of Canada, viz., Athabasca, Alberta, Saskatchewan, and Assiniboia. By an Order in Council, dated May, 1882, these were erected out of the Northwest Territories, for the convenience of settlers and for postal and other purposes.

Assiniboia.—The District of Assiniboia, about 95,000 square miles in extent, is bounded on the south by the 49th parallel; on the east by the western boundary of Manitoba, meridian 101½; on the north by the southern boundary of Saskatchewan, the 52d parallel of latitude; and on the west by the eastern boundary of Alberta, near meridian 111½.

Saskatchewan.—The District of Saskatchewan, about 114,000 square miles in extent, is bounded on the south by Assiniboia and Manitoba; on the east by Lake Winnipeg and the Nel-

son river; on the north by the 55th parallel of latitude; and on the west by Alberta, meridian 111½.

Alberta.—The District of Alberta, about 100,000 square miles in extent, lies between the 49th parallel on the south and the southern boundary of Athabasca, the 55th parallel, on the north; and between the western boundaries of Assiniboia and Saskatchewan, meridian 111½, on the east, and the eastern boundary of British Columbia on the west.

Athabasca.—The District of Athabasca, about 122,000 square miles in extent, lies between Alberta on the south and the 60th parallel of latitude on the north; and between the eastern boundary of British Columbia, meridian 120, on the west, and the meridian forming the eastern boundary of Alberta, continued north until it intersects the Athabasca river, thence that river, Lake Athabasca, and Slave river, to the 60th parallel.

TERRITORIES.

NAME.	Area in miles.	Most important places.
Assiniboia.....	95,000	Regina, Qu'appelle, Moose Jaw, Livingstone, Chesterfield, Wood Mountain, Forts Walsh and Felly, Broadview, Medicine Hat, and Touchwood.
Saskatchewan....	114,000	Battleford, Cumberland, Prince Albert, Saskatchewan, Forts Pitt, Carleton, and La Corne.
Alberta.....	100,000	Fort Macleod, Edmonton, Victoria, Rocky Mountain House, Forts Calgary, Saskatchewan, Old Bow, and Assiniboine.
Athabasca.....	122,000	Dunnegan, Vermilion, Peace River, Athabasca, Forts Macleod, and Lesser Slave.
Keewatin.....	360,000	Fort York, Fort Churchill, Norway, and Oxford.

The remaining portions of Canada, unofficially named Northwest, North, and Northeast Territories, include nearly one half of it. The capital of the organized Territories is Regina. Formerly it was Battleford, but it was changed in 1882 to its present site.

Population.—The official census shows that Canada contained, in 1881, 4,824,810 souls. The following table exhibits the countries in which these were born, with the number from each:

England.....	169,504	Russia.....	6,376
Ireland.....	152,526	Spain.....	215
Scotland.....	115,082	Sweden, Norway..	2,076
Canada.....	3,715,492	United States.....	77,758
Other colonies.....	8,148	Other places.....	14,169
France.....	4,839		
Germany.....	25,893	Total.....	4,824,810
Italy.....	777		

The following table gives the population according to origin or nationality of parents:

African.....	21,894	Jewish.....	667
Chinese.....	4,388	Russian.....	1,227
Dutch.....	80,419	Scandinavian.....	4,214
English.....	881,801	Scotch.....	699,868
French.....	1,298,939	Spanish.....	1,179
German.....	254,819	Swiss.....	4,583
Icelandic.....	1,009	Welsh.....	9,947
Indian.....	108,547	Others.....	43,566
Irish.....	957,408		
Italian.....	1,849	Total.....	4,824,801

In this table Canadians and Americans are classed under the various headings, English, French, Irish, Dutch, etc.

By provinces, the following is the classification of the population:

Ontario.....	1,928,388	Prince Ed. Island..	108,89'
Quebec.....	1,869,027	Manitoba.....	65,954
Nova Scotia.....	440,579	British Columbia...	49,459
New Brunswick...	821,388	Territories.....	56,446

Norm.—This is the census of 1881. Since that date Manitoba and the Territories have increased by immigration over 150,000 (1888).

The following statement shows the total number of the adherents to the various churches in Canada. (For more extended information concerning the leading denominations, see the articles under their respective titles.)

Adventists.....	7,311	Methodists.....	742,981
Baptists.....	206,525	Pagans.....	4,478
Brethren.....	8,581	Presbyterians.....	686,165
Roman Catholics...	1,791,982	Quakers.....	6,558
Anglican.....	574,818	Unitarians.....	2,126
Congregational.....	26,900	Universalists.....	4,517
Disciples.....	20,198	Not given.....	110,191
Refor'd Episcopal..	2,596		
Jews.....	2,898	Total.....	4,824,801
Lutherans.....	46,850		

Indians.—There are nearly 108,000 Indians in the Dominion, distributed as follows:

Ontario.....	15,780	Athabasca District..	2,398
Quebec.....	11,071	British Columbia...	35,052
Nova Scotia.....	9,219	Rupert's Land.....	8,770
New Brunswick....	1,416		
Prince Ed. Island...	290	Total.....	107,729
Manitoba & N. W. Ter.	85,736		

Of the above, 46,962 reside on reserves, and cultivate 75,365 acres of land.

Schools are maintained for the children of Indians chiefly at the expense of the Dominion Government. The attendance at them is as follows:

Ontario.....	1,907	N. W. Territories.....	971
Quebec.....	414	British Columbia.....	652
Nova Scotia.....	107		
New Brunswick.....	67	Total.....	4,126
Prince Ed. Island.....	18		

History and Government.—The Dominion of Canada was founded on the 1st of July, 1867, by the federal union of the provinces, Nova Scotia, New Brunswick, and the Canadas, Upper and Lower. By the act of Union the Canadas were named Ontario (Upper), and Quebec (Lower). The "British North America Act" is the name given to the Imperial statute creating the Dominion. In that statute authority is given to create the province of Manitoba. By virtue of that, and succeeding imperial and Canadian statutes amending it, that province was admitted into the Dominion in 1870, being formed out of that part of the Hudson Bay Territory known as Assiniboia Colony, or earlier as Selkirk Settlement. This Assiniboia was not the same as the present Territory of Assiniboia, but more nearly corresponded to the present Manitoba. In 1871 British Columbia was admitted into the Dominion, and in 1873 Prince Edward Island. The Territories were acquired in 1870, by transfer from the Hudson Bay Company.

The form of government in Canada is in theory monarchical, but in practice republican. It consists of a legislative and an executive power. The legislative power is a Parliament composed of a House of Commons, a Senate, and a Governor-General. The members of the House of Commons are elected by popular vote. At the time of the Confederation, this House consisted of 181 members, of whom 82 were elected from Ontario, 65 from Quebec, 19 from Nova Scotia, and 15 from New Brunswick. These numbers are readjusted according to each decennial census, subject to the following rules: Quebec has the fixed number of 65 members. There shall be assigned to each of the other provinces such a number of members as will bear the same proportion to the number of its population (ascertained at such census) as the number 65 bears to the number of the population of Quebec (so ascertained). In the computation of the number of members for a province, a fractional part not exceeding one half of the whole number requisite for entitling the province to a member, shall be disregarded; but a fractional part exceeding one half of that number shall be equivalent to the whole number. On any such readjustment the number of members for a province shall not be reduced unless the proportion which the number of the population of the province bore to the number of the aggregate population of Canada at the then last preceding readjustment of the number of members for the province is ascertained at the then latest census to be diminished by one-twentieth part or upward. Such readjustment shall not take effect until the termination of the then existing Parliament.

After the census of 1881 the readjustment

stood as follows: Quebec, 65; Ontario, 92; Nova Scotia, 21; New Brunswick, 16; Manitoba, 5; British Columbia, 6; Prince Edward Island, 6; total, 211.

The members continue in office for a period of five years from the day of the return of the writs, subject, however, to an earlier dissolution by the Governor-General. The meetings of the House of Commons are presided over by one of its own members, elected Speaker. To become a member of Parliament no property qualification is necessary, but every member must be either a native-born or legally naturalized British subject. In 1874 voting by ballot was introduced, and the law for the prevention of bribery and other corrupt practices at elections was made more stringent than formerly. The elections, except those for British Columbia, Manitoba, and some of the remote or thinly settled districts of Ontario and Quebec, take place, according to law, on the same day throughout the Dominion.

The Senate of Canada, at the time of confederation, was composed of 72 numbers, 24 being appointed from Ontario, 24 from Quebec, 12 from New Brunswick, and 12 from Nova Scotia. The present (1884) status of the Senate is: Ontario, 24; Quebec, 24; Nova Scotia, 10; New Brunswick, 10; Manitoba, 8; British Columbia, 8; Prince Edward Island, 4; total, 78. By the British North America Act, the number of Senators is limited to the present number 78, unless Newfoundland should enter the Dominion, in which case provision is made to allow the number to reach 82. The chief qualifications to be a Senator are: to be thirty years of age; to be either a native-born or a naturalized British subject; to hold, over and above all mortgages or charges of any kind, property valued at \$4,000; to be a resident in the province for which he is appointed; in Quebec, to be resident in the electoral district for which he is appointed. Senators are appointed for life (subject to certain conditions) by the Governor-General in Council, or practically by the Premier or leader of the government of the day, who recommends the appointment. A Senator is disqualified by non-attendance in the Senate for two consecutive sessions. The Governor-General is appointed by the Government of Great Britain and Ireland, and represents the Queen. Wherever the Governor-General is named it is clearly understood, and is so stated in the British North America Act, that it refers to the Governor-General acting by and with the consent of the Queen's Privy Council for Canada. His special or independent functions are few. He has the privilege of declaring "according to his discretion, but subject to the provisions of the British North America Act, and to instructions from the British Government, either that he assents in the Queen's name to a bill that has passed both the House of Commons and the Senate, or that he withholds the

Queen's assent, or that he reserves the bill for the signification of the Queen's pleasure." When the Governor-General, in the Queen's name, assents to any bill, he sends by the first opportunity an authentic copy of the act to one of the principal Secretaries of State for the Government of Great Britain and Ireland, and if the Queen in Council within two years after the receipt thereof thinks fit to disallow the act, such disallowance, being signified by the Governor-General, annuls the act from and after that day. The salary of the Governor-General is £10,000 sterling (\$50,000), payable out of the Consolidated Revenue Fund of Canada. The legislative jurisdictions of the Canadian and the Provincial legislatures are clearly defined—in this, as indeed in the general plan of confederation, much has been modeled after the general Constitution of the United States. The provinces stand nearly in the same relation to the Dominion that the individual States do to the Union. But there is one very important difference, that all matters not specifically mentioned as coming under the exclusive jurisdiction of the various provinces, belong exclusively to the Dominion.

This division of legislative jurisdiction has been the subject of considerable controversy between the province of Ontario and the Dominion. One point of dispute, the control of the liquor-traffic, was finally settled by appeal to the Privy Council of Great Britain in the autumn of 1888. The Government of Canada claimed that the powers exercised by the provinces of not only raising a revenue from the sale of liquor-licenses, but also of limiting the hours and modes of such sale, were in excess of their privileges, and consequently in the session of 1883 the Dominion Parliament passed a general liquor law. This law did not in itself interfere with the provincial laws, but while asserting the right of the federal authority in such matters, imposed double liquor laws on the provinces. A test case was submitted to the Privy Council of Great Britain and Ireland, with the result that Ontario, and hence all the provinces, is confirmed in the right of limiting the hours and modes of selling, as well as of levying the revenue on shops, saloons, etc.

Another subject of contention was in the matter of escheats. The province of Ontario claimed, on the death without heirs of a person named Mercer, that his property reverted to the province. The Canadian Government claimed it as reverting to Canada. As in the former case, the Privy Council sustained the province of Ontario. Several questions involving disputed jurisdiction are still pending, so that before many years the relative duties and powers of both federal and provincial legislatures will be definitely settled.

Viscount Monck was Governor-General when the Dominion was established. He was succeeded in 1868 by Sir John Young.

Lord Dufferin was appointed in 1872, and retained the office for nearly seven years. The Marquis of Lorne was Governor-General from 1878 to 1888, when he was succeeded by the Marquis of Lansdowne. The administration of justice is intrusted to judges appointed for life, i. e., during good behavior, but removable by the Governor-General on address of the Senate and House of Commons. The Governor-General in council appoints the judges of the Superior, District, and County Courts in each province, except those of the Probate Courts in Nova Scotia and New Brunswick. These judges must be selected for the provinces of Ontario, Nova Scotia, New Brunswick, Prince Edward Island, British Columbia, and Quebec, from the bars of those provinces. There is a Supreme Court of the Dominion, which is a general Court of Appeal.

Militia.—The militia of Canada are under the control of a Minister of Militia and Defense, who is responsible to Parliament. The militia consists of all male inhabitants of Canada of the age of 18 years and upward to 60, not exempted or disqualified by law, and being British subjects; but the Government may require all male inhabitants capable of bearing arms to serve, in case of a levy *en masse*. The militia-men are divided into four classes, as follow: 1. Unmarried men and childless widowers from 18 to 30 years of age. 2. Unmarried men and childless widowers from 30 to 45 years of age. 3. Widowers with children and married men from 18 to 45 years of age. 4. Those from 45 to 60 years of age. These shall serve in order as above. The militia is divided into active and reserve land force, and active and reserve marine force. The active land force is composed of corps raised by voluntary enlistment; corps raised by ballot; corps composed of men raised by voluntary enlistment and of men balloted to serve. The active marine force is similarly raised, and is composed of seamen, sailors, and persons whose usual occupation is upon any vessel navigating Canadian waters.

Canada is divided into 12 military districts, each under the supervision of a deputy adjutant-general assisted by brigade-majors. These districts are subdivided into brigade divisions, and these still further into regimental and company subdivisions. The militia is to be enrolled each year by the officers of the reserve militia.

The active militia consists of cavalry, artillery, engineers, mounted infantry, infantry and marine corps, a total number (all volunteers) of about 86,000 men.

The term of service is three years. These turn out annually for twelve days' drill, as a rule, in brigade camps, where they undergo a fairly good training (under canvas) in their duties. The strength of the regiment is usually from 6 to 10 companies of 42 men and 8 officers each. There is an officer commanding the militia, selected from the regular army of Great Britain, and holding rank therein of colonel or a superior rank. He ranks as ma-

for-general in the militia, and receives a salary of \$4,000.

There is a permanent college, the Royal Military College of Canada, at Kingston. Its objects are to impart a complete education in all branches of military tactics, fortification, engineering, and general scientific knowledge.

Finance.—The total debt of Canada, which in 1867 was \$93,046,052, in 1882 was \$205,865,252, and bore an average interest of 8.82 per cent. The amount of debt payable in Canada was \$73,242,377, consisting of provincial debts assumed, savings-bank deposits (\$14,229,000), Dominion stock, etc., and \$15,807,910 of Dominion notes. The debt payable in London, which in 1867 amounted to \$67,069,116 and bore an average interest of 5.55 per cent., had grown by 1882 to \$182,122,875, the rate of interest having been reduced to 4.89 per cent. Where, in the first year of confederation, the major portion of the foreign debt bore 6 per cent. interest, the portion paying so high a rate had, by 1882, been reduced to \$9,254,000, and the large sum of \$89,060,000 bore only 4 per cent., the remainder bearing a rate of 5 per cent. No less than \$4,000,000 of debt was retired in the year last named.

The Consolidated Fund of Canada is composed of her public works, such as canals, water-power, railways, railway debts, harbors, and river and lake improvements, together with all securities, cash, bankers' balances, lands, mines, and royalties, as well as the revenues from customs, excise, and public lands. The receipts on account of this fund, in 1882, were \$33,883,000, of which \$21,581,000 were from customs, and \$5,884,000 from excise. The further receipts were \$23,000,000, consisting of Dominion notes, savings-bank and other loans. The expenditure on Consolidated Fund account was \$27,067,000, otherwise, \$29,000,000, of which \$12,000,000 went in redemption of debt. The sum of \$7,351,000 was expended in 1882 on capital account, two thirds of which was for railways, the remainder on canals, telegraphs, and Dominion lands. The post-office savings-banks show an increase during 1882 equal to \$2,260,000 over 1881. The number of accounts is 25,633 greater (51,463 is the total number), and the average amount at the credit of each depositor has grown from \$97 to \$184 in fifteen years.

Banking.—Canadian banks resemble most closely the joint-stock banks of Scotland, which first came into existence early in the last century; with, however, the important difference that where each individual proprietor in the latter is liable to the full extent of his property for the obligations of the bank, the Canadian shareholder is, like the American one, liable only for double the amount of his shares. In some particulars, both of banking and currency, the United States model has been followed. The decimal currency system of dol-

lars and cents, used for a hundred years by their American neighbors, was adopted by Canadians twenty years ago.

The banking system of Canada is not, certainly, a copy of the cash-credit or personal security system of Scotland, where one can get credit from a bank if sureties will vouch for him. Nor is the system closely allied to what may be described as the mortmain or funded security plan of English bankers, under which one must either deposit title-deeds to land or hand over Government or other stock, to obtain a loan. Loans are freely made by Canadian banks on stocks and bonds, but lending upon real estate is left to the loan societies. The largest item by far among the assets of the banks is their discounts of promissory notes bearing two or more names. The rate of interest charged has ranged of late years from 7 to 9 per cent.; to-day it ranges from 6 to 8, 7 per cent. being the legal rate.

Early in 1870 the banks ceased to issue notes of a smaller denomination than \$4, and in the next year the \$1 and \$2 notes were issued by the Government, as they have since continued to be. Offices of the Receiver-General and Government savings-banks were opened in various cities, for the issue and redemption of the small notes and for the sale of Dominion stock. Assimilation of the currency of the various provinces was provided for by Hincks's act of 1870, and the British silver coins, which up to that time had circulated in Canada, were arranged to be withdrawn.

By the act of 1871 banks were required to hold not less than one third of their cash resources in Dominion notes, which are procurable in exchange for gold at all times. The Government was constituted the chief specie-reserve-provider and comptroller. An amendment of April, 1882, provided that any excess over \$9,000,000—to which amount the issue of Dominion notes was at that time limited—may be held by the Receiver-General partly in specie and partly in deposits in chartered banks, the proportion being 20 per cent. in specie and 80 per cent. in deposit receipts. By the act of 1871 banks were exempted from tax upon their circulation.

Among the twelve heads of departments who administer the affairs of Canada at Ottawa, not the least important is the Minister of Finance, a minister of the Crown, who is charged with the direction and control of the public accounts, revenue and expenditure, and financial affairs generally of the country, excepting customs and inland revenue, which have separate ministers. The banks and the currency are under the control of this department.

The paid-up capital of the twenty-seven banks of Canada at the date of confederation (1867) was under \$30,000,000; their circulation, \$10,000,000; deposits, \$38,000,000; and discounts, \$53,000,000. The number of banks had grown by 1883 to forty, whose aggregate capital exceeded \$61,000,000; circulation, \$84,-

000,000; deposits, \$106,000,000; and discounts, \$145,000,000.

of Canada, with the amount and value of their shares, their capital, and reserve funds in March, 1883:

The following is a list of the chartered banks

BANKS.	When chartered.	Amount per share.	Capital paid.	Res.	Yearly dividend.	Cash value per share.
Bank of British North America.....	1868	250	\$4,866,666	\$1,215,000	Per cent.	\$273 50
Canadian Bank of Commerce.....	1867	\$50	6,000,000	1,630,000	6	68 25

La Banque d'Hochelega.....	683,300
Total.....	\$60,873,241	\$16,064,560

Building and Loan Societies.—The loan companies of Canada play an important part in her money-lending system. They were established as building societies after the English plan, the design being to assist investors to acquire land or to build houses by making payments in regular installments to that end; but they have for the most part changed their method of late years, and now lend upon the security of real estate the money which they receive from depositors in Canada, and debenture-holders in the United Kingdom, in addition to their paid-up capital. In 1846 legislation was granted in Upper Canada favoring such societies. About 1847 very similar acts were passed by Quebec and New Brunswick, and in 1849 by Nova Scotia.

The growth of societies of this kind, both in number and extent, has been remarkable, especially in Ontario. In the first return of their operations made to Government in 1868, only eleven permanent building societies were included, having a total capital of \$1,208,000, deposits of \$365,000, and mortgage loans of \$1,500,000. There were, besides, at this time terminable building societies whose aggregate capital was \$873,000. By 1873 the number of societies shown in this yearly return had grown to twenty-three; their capital to 6,876,000;

deposits to \$2,869,000, while the value of the mortgages they held exceeded \$9,500,000. It was soon found possible to borrow money in Britain, however, at lower rates and in larger sums than was possible at home; and in 1874 a Dominion act was passed granting power to such societies to issue debentures. Several of the leading companies at once became borrowers in the Scottish and English money-markets, and the additional capital obtained gave a decided impetus to the working of such leading corporations. By a return to Government for the calendar year 1880, it appears that at least eighty such societies were then in existence in the Dominion; capital, \$24,495,975; deposits, \$11,713,633; loans secured on real estate, \$56,612,200.

Insurance Companies.—There are in Canada sixty-nine insurance companies, some of which do more than one kind of insurance. The nature of the business done by them is as follows: companies doing life-insurance, 39; fire, 29; inland marine, 6; ocean, 3; accident, 5; guarantee, 2; plate-glass, 1; steam-boiler, 1. The deposits for the protection of policy-holders, held by the Receiver-General in trust for these companies, according to the last official report, amounted to \$7,032,377.53.

The total net amount insured by fire-policies

in force in Canada at the end of 1881 was \$462,210,968. The premiums received by all companies for fire-insurance during 1881 amounted to \$3,827,116. Of this amount Canadian companies received \$1,206,476; English companies, \$2,358,258; and American companies, \$267,388.

The total amount received in premiums by marine companies during 1881 was \$3,181,925.97. Of the 89 life companies, 9 are Canadian, 18 British, and 12 American. The total amount of life-insurance in force at the end of 1881 was \$108,290,982. Of this amount \$46,041,591 is in Canadian companies, \$20,988,092 in English companies, and \$36,266,249 in American companies. In all 62,857 persons are insured. The following was the surplus of assets over liabilities of the Canadian companies in existence at the end of 1881: Canada Life, \$451,752; Citizens', \$20,518; Confederation, \$235,916; Mutual Life, \$42,107; North American, \$59,831; Ontario Mutual, \$27,495; Sun, \$127,324; Toronto, \$37,510.

Agriculture.—The total value of the agricul-

tural exports from the Dominion for 1881 was \$21,268,327. The several provinces exported these products as follows: Ontario, \$11,426,692; Quebec, \$8,242,024; Nova Scotia, \$526,004; New Brunswick, \$141,772; Manitoba, \$21,367; Prince Edward Island, \$910,222.

The agricultural products were sent almost entirely to England and the United States; \$9,490,890 to the former, and \$10,631,374 to the latter. Fourteen countries in all shared in these exports. The chief productions of the soil exported were as follow:

ARTICLES.	Bushels.	Value.
Barley.....	8,800,579	\$6,621,188
Beans.....	108,928	117,708
Oats.....	2,926,582	1,191,578

Forest Products.—The total value of the productions of the forest exported in the year 1881 was \$24,960,012. The several provinces exported as follows: Ontario, \$6,576,832; Quebec, \$12,785,228; Nova Scotia, \$1,325,280; New Brunswick, \$4,068,241; British Columbia, \$162,747; Prince Edward Island, \$42,189.

Mineral Products.—The total value of the mineral products exported from Canada in 1881 was \$2,767,829. The following statements show the amount of each mineral exported:

ARTICLES.	Tons.	Value.
Coal.....	420,055	\$1,123,091
Gold-bearing quartz.....		767,218
Gypsum.....	180,961	119,399
Mineral oils..... gallons	2,466	681
Antimony-ore.....	46	3,931
Copper-ore.....	19,802	180,419
Iron-ore.....	44,677	114,850
Manganese-ore.....	2,101	88,738
Silver-ore.....		34,494
Phosphates.....	18,601	289,498
Salt..... bushels	259,555	89,566
Sand and gravel.....	65,860	12,511
Stone and marble.....	23,189	81,924
Other minerals.....		41,481

Fisheries.—The exports of fish and articles produced from fish and other marine animals, amounted in 1881 to \$6,867,715. The value exported from the various provinces was as

follows: Ontario, \$128,839; Quebec, \$747,549; Nova Scotia, \$4,278,731; New Brunswick, \$786,400; Manitoba, \$3,980; British Columbia, \$400,984; Prince Edward Island, \$521,282.

Manufactures.—A great impetus has been given to manufacturing interests throughout the Dominion by the protective act known as the National Policy. In addition to supplying the demand of Canada itself with a very large part of the articles necessary in every department of life and labor, the manufacturers are now able to compete successfully in some important lines with other countries. The amount of capital invested was \$165,802,623; hands employed, 254,935; total value of products, \$309,676,068. Manufactures were exported from Canada in 1881 to twenty-seven other countries, the total value being \$3,075,095.

The value of the principal articles manufactured for export was as follows:

Agricultural implements.....	\$31,269
Biscuits.....	17,923
Carriages.....	46,442
Clothing.....	9,969
Cordage, ropes, and twine.....	12,081
Extract of hemlock-bark.....	180,068
Furs.....	8,222
Grindstones.....	85,756
Gypsum or plaster, ground.....	13,888
Iron: Stoves.....	8,309
Other castings.....	14,587
Scrap.....	191,210
Other, and hardware.....	84,718

Junk and oakum	85,177
Leather: Sole and upper	416,909
Boots and shoes	101,737
Liquors: Ale, beer, and cider	20,824
Whisky	2,598
Other spirits	3,264
Machinery	40,201
Oil-cake	89,474
Organs	27,612
Rars	49,044
Sewing-machines	165,452
Ships sold to other countries	848,018
Starch	82,691
Steel, manufactures of	143,656
Stone and marble, wrought	18,302
Tobacco	44,808
Wood: Furniture	100,857
Doors, sashes, etc.	22,280
Other manufactures of	291,657

	Miles.	Increase during year.
Railways in operation	7,530.44	269.98
Railways having the track laid	539.00	203.70
Railways being graded, etc.	8,139.16	279.16
Total	11,258.60

The nominal capital on June 30, 1882, was:

Ordinary share capital	\$142,936,524 68
Preference share capital	71,581,940 40
Bonded debt	92,487,932 49
Aid from Government and municipalities	108,655,419 85
Total	\$415,611,810 30

This shows an increase of \$26,326,109.99 over the previous year.

The number of passengers carried during the year ending June, 1882, was 9,352,835; an increase of 2,408,664, or 34.68 per cent. The freight handled was 18,575,787 tons, an increase of 1,510,364 tons, or 12.51 per cent.

The earnings of the railways for 1881-'82 are:

		Increase for year.
Passengers	\$10,618,478	\$1,795,294
Freight	17,729,945	*
Mails and express	1,087,460	91,801
Other sources	235,567	90,525
Earnings of roads not detailed	6,049	267
Totals	\$29,097,739	\$1,977,817

The operating expenses are:

Maintenance	\$4,614,041	Increase, \$498,948
Working and repairing of engines	6,384,580	" 850,810
Working and repairs of cars	2,319,015	" 158,801
General operating expenses	8,648,989	" 894,428
Expenses of roads not detailed	72,188	Decrease, 183,092
Total	\$22,890,708	Net inc's, \$2,269,290

Thus the earnings show an increase of \$1,040,280, and the working expenses of \$2,269,290, over the previous year.

The net profits were:

Receipts	\$29,097,739
Expenses	22,890,708
Net profit	\$4,687,081

The construction of the Canada Pacific Railway was one of the conditions under which British Columbia entered into the union of provinces. It was at first the intention to make the work a Government enterprise, and as such it was begun. In 1881, however, the road was transferred to a company. By the terms of contract, this company was bound to complete the line through Canadian territory, from Callander in Ontario to Port Moody in British Columbia. As the most difficult parts of the road were not at that time completed, it was only on receipt of great privileges and subsidies that the company undertook the work. An important privilege granted to the company is that "for twenty years from the issue of the charter (1881), no line of railway shall be authorized by the Dominion Parliament to be constructed south of the Canada

* Though the increase in freight in tons was 12.51 per cent., yet the receipts for freight show a decrease of \$97,087 as compared with the previous year.

Shipping.—The total number of vessels registered in the Dominion, Dec. 31, 1881, was 7,394, measuring 1,310,896 tons, register tonnage. The total estimated value of these vessels was \$39,326,880. Three hundred and thirty-six new vessels were built in the Dominion during 1881, measuring 74,060 tons, register tonnage, and valued at \$3,332,700.

The merchant shipping of the Dominion is now exceeded by that of three other countries: Great Britain, the United States, and Norway.

Exports.—The exports from Canada amount annually to about \$100,000,000. They consist chiefly of the products of the forest, the mine, agriculture, and animals.

The rapid increase in the export trade of the Dominion during the years 1880 and 1881 is shown by the following table:

COUNTRIES.	1879.	1880.	1881.
Great Britain	\$36,295,718	\$45,846,062	\$58,751,570
United States	27,165,501	33,849,909	36,866,235
France	714,875	812,839	662,711
Germany	112,090	83,287	84,982
Spain	50,596	60,727	46,658
Portugal	185,748	165,865	108,594
Italy	143,472	163,737	145,997
Holland	9,718	102,592	215,754
Belgium	40,490	638,311	258,438
Newfoundland	1,641,417	1,510,800	1,528,469
British West Indies	1,955,564	1,906,058	1,757,518
Spanish West Indies	1,287,598	1,319,588	1,167,612
French West Indies	219,131	228,978	111,175
Other W. India islands	88,367	94,459	80,769
South America	741,442	789,940	782,111
China and Japan	56,551	87,546	19,761
Australia	290,762	189,901	146,363
South Africa	45,515	82,178	81,644
Other countries	541,755	534,651	499,287
Totals	\$71,491,255	\$87,911,456	\$93,290,822

In 1882 the largest share of Canadian exports went to the United States, while the greater portion of the imports came from Great Britain. Thus:

COUNTRIES.	Exports.		Imports.	
	Per cent.	Per cent.	Per cent.	Per cent.
United States	48.94	42.86	44.91	43.86
Great Britain	44.88	44.91	44.91	43.86
Other countries	8.78	12.23	10.18	12.28

Railways.—Although the railway system of Canada is yet in its infancy, immense and rapid strides have been made in recent years, as the following statistics show. The total mileage on June 30, 1882, was:

Pacific Railway, from any point at or near the Canada Pacific Railway, except such line as shall run southwest, nor to within fifteen miles of latitude 49. And in the establishment of any new province in the Northwest Territories provision shall be made for continuing such prohibition." This clause was intended to bar the entrance into the United States of any other road; in other words, to force trade through Canada *via* the Canada Pacific Railway, or, if through the United States, over their lines. The province of Manitoba claims that, as it was organized as a province before the passage of that act, the clause is of no effect in its territory; therefore rival lines are being projected to the Dakota border from Manitoba.

The lands of the company in the Northwest are offered on terms as favorable as the Government's, and already some millions of acres have been disposed of.

Recent investigations, coupled with the experience of 200 years, have proved that Hudson bay is navigable, and its ports are open for at least six months each year. This route is attracting attention among capitalists and business men in Great Britain, and two railways are in course of construction from Winnipeg to York Factory. The distance from Liverpool to York Factory, or Fort York, is a little less than to Montreal.

Canals.—The canal system of Canada is extensive, locks being required to overcome the rapids on the St. Lawrence river as well as Niagara Falls. These are the important canals of Canada, but minor ones are in use to render navigable the Ottawa, the Rideau to Kingston, the Trent river and lakes, the Richelieu to Lake Champlain, and thence to Albany, and other waters. The Trent valley, the Georgian bay and Ontario, or the Huron and Ontario canal, is intended ultimately to connect the Georgian bay waters with those of Lake Ontario.

The following table indicates the cost of the canals from the outset, as well as their earnings for the year 1882:

CANALS.	Total cost.	Earnings for 1882, including tolls, rents, etc.
Lachine	\$3,168,718 09	\$114,578 09
Beauharnois	1,624,892 01	
Cornwall	2,532,519 81	
Williamsburg—i. e., Farrar's, Rapide, and Galops	1,826,312 54	
St. Lawrence river below Montreal, dredging, etc.	187,404 08	
Welland	20,209,865 09	116,250 88
St. Ann's	382,248 66	58,511 05
Carillon and Grenville	2,855,858 92	
Culbute	812,577 28	
Rideau	4,192,670 10	
Chambly	651,745 01	7,892 26
St. Peter's	526,747 19	24,022 20
Burlington Bay	926 74
Survey of Baso Verte	9,992 78	8,807 90
Total	\$48,418,602 87	\$326,029 08

Art Education.—Industrial drawing finds a place in the programme of school studies of

every province of the Dominion. The object aimed at is practical drawing. Nothing of a purely artistic nature is taught in the public schools, but only such drawing as can be done by all who attend school. Teachers are compelled to pass an examination on this subject before obtaining their certificates.

Art education, in the strictest sense of the application of the term art, is not neglected. In both Ontario and Quebec the Government makes a liberal grant in aid of art-schools. In Ontario there are three of these special schools of art—in Toronto, London, and Ottawa. In Quebec there are a number of smaller institutions aided by the Government grant, which is made through the Society of Arts and Manufactures. The Marquis of Lorne and the Princess Louise did a great deal for the encouragement of painting in Canada, and it was through their interest in the subject that the Royal Academy of Artists was established. This society holds an annual exhibition in some of the large cities of the Dominion, and has done much to develop the taste of the people, and to direct general attention to the subject of art.

Medical Education.—The various medical colleges throughout the Dominion are in a very efficient condition as regards the theoretical part of the work, but not quite so fully up to the present requirements of complete medical education in a practical point of view. In all the universities and colleges a full four-years' course of study is required, and in some of the colleges there is a summer session. On the more important subjects—as medicine, surgery, and anatomy—there are two courses of six months each. The degrees and licenses granted by the different universities and colleges in Canada are accepted by licensing bodies of Britain, and admit the holder of such degree or license to examination for a qualification to practice in Britain without further attendance upon lectures. A student who obtains the degree of M. B. or M. D. from a Canadian university, is not eligible for practice until he has also obtained the diploma of the licensing body for the province in which he intends to practice. On account of this regulation, nearly all the students take the examinations of the university with which their college is affiliated, and also that of the Council of the College of Physicians and Surgeons, for the necessary license to practice. Students must spend at least three winter sessions in hospital work, and at least six months of a summer term with a regular physician in practical compounding and dispensing, in order to be admitted to the final examination of the council. No qualification whatever from the United States admits to practice in Canada; and only such from Britain as can be registered there as a qualification in medicine and surgery.

CAPE COLONY AND SOUTH AFRICA. The Cape of Good Hope is a British colony at the southern extremity of the continent of Africa. It was first settled by the Dutch, and passed into

the possession of Great Britain during the Napoleonic wars. It has had a responsible government since 1872. The Parliament consists of a Legislative Council of 21 and a House of Assembly of 68 members, both elected by voters qualified by a certain amount of income. The Governor is Sir Hercules G. R. Robinson, appointed in 1880. The Prime Minister is T. C. Scanlen.

Area and Population.—The area of Cape Colony proper is estimated at 199,950 square miles. Its population in 1875 was 720,984, of whom 236,873 were of European origin. The great majority of the European population are descendants of the original Dutch, French, and German settlers. The colored population consists chiefly of Kaffirs and Hottentots. The rest are half-breeds and imported Malay laborers. Cape Colony includes a large extent of annexed native districts, some parts of which contain a considerable white population. Including Basutoland, which was placed under the administration of the colonial authorities in 1875, but again detached in 1883, the total area of Cape Colony was 441,750 square miles, and its total population 1,618,211. These dependencies and annexed districts comprise Griqualand West with an area of 17,800 square miles and a population of 45,277; the Transgariëp, or Damara and Namaqua Lands, having an area of 200,000 square miles, and a population of about 250,000; and the Transkeian districts, otherwise called Kaffirland proper, with an area of 17,000 square miles, and a population of 475,000. The area of Basutoland is 7,000 square miles, and its population 127,000.

Commerce.—The commerce of Cape Colony in 1881 consisted of exports to the value of £4,220,706, and imports to the value of £9,227,171. Wool is the only important export article, constituting nearly nine tenths of the total exports. Minor articles of export are copper-ore, ostrich-feathers, and sheep-skins. The quantity of wool shipped to England in 1881 was 47,165,019 pounds. The number of sheep in the colony in 1875 was 9,836,065. There were 961 miles of railway open on the 1st of January, 1882.

Finance.—The revenue of the colony in 1881 was £4,885,189, including money borrowed; the expenditure, £5,472,263. There was a debt in 1882 of £15,441,700.

Natal.—Natal, formerly a part of the colony of the Cape of Good Hope, was detached and made a crown colony in 1856, administered by a Governor with the assistance of an Executive Council and a Legislative Council, the latter consisting, since 1879, of 18 official and 15 elective members. The area is estimated to be 21,150 square miles. The population in 1881 was computed to be 408,280, comprising 25,271 of European descent, mostly English, 362,477 natives, and 20,586 coolies. There was a decrease in both the white and native population since 1877. The exports in 1881, chiefly wool, amounted to £474,984; the imports to £1,194,-

992. The revenue of the colony amounted in 1881 to £518,924; the expenditure to £492,888; the public debt to £1,631,701. The Governor is Sir Henry Ernest Bulwer.

Transvaal State.—The Transvaal State, or South African Republic, independent since 1852, was annexed to the British crown in 1877. After the Transvaal war complete autonomy was restored by the convention of Aug. 8, 1881, but suzerain rights were preserved with respect to foreign affairs, giving the British Government supreme control over the relations of the republic with the native races. The area is 110,188 square miles. The white population is from 40,000 to 45,000, descendants of the original Dutch and Huguenot settlers of the Cape. The native population numbered, in 1879, 774,980. A triumvirate, composed of S. J. P. Kruger, M. W. Pretorius, and P. J. Joubert, was elected, Dec. 13, 1880, and invested with extraordinary powers. Kruger was elected regular President in 1883.

Orange River Republic.—The Orange Free State achieved independence in 1854. It has an area of 41,820 square miles. The white population, according to the census of March 31, 1880, was 61,022; the native population, 72,496. The Orange Republic has no debt, but possesses a considerable estate in lands, buildings, and accumulated funds. The imports in 1881 amounted to £2,588,738, the exports to £4,001,658. Wool is the chief product; the quantity exported in 1881 was 80,853,025 pounds.

Separation of Basutoland from Cape Colony.—The principal question of the year at the Cape of Good Hope was the rearrangement of the affairs of Basutoland. The Basutos are a tribe of the Bechuana race which inhabits the eastern part of the South African elevation. In the beginning of the century they possessed, besides the present Basutoland, a large part of what is now the Orange Free State. There Mosele, with his Matabele warriors, fell upon them and annihilated the whole tribe, except those who escaped to the inaccessible region in which the Orange river takes its rise. The Boers moved into the deserted plains in the third decade of the century, broke the power of the Matabeles, and formed a bulwark for the Basutos, behind which they grew again into a numerous people. They were reminded by the needs of their now redundant population that the Free State Boers were settled upon lands which had once been their own. The circumstance that no boundary had ever been agreed to between the Free State and Basutoland left the way open for disputes. The Basutos began an aggressive course, as usual, by cattle-stealing. The Boers retaliated, and a long border war followed, in which forays for the capture of cattle and the destruction of crops, rather than the taking of life, were the distinguishing feature. The Basutos, under the tuition of French missionaries, had made astonishing progress in civilization, and possessed in their chief, Moses, a leader of char-

acter and ability. When the war had lasted six years, and both sides suffered severely from the losses of property, a peace was concluded between Moses and the Free State in 1858. The cause of the war remained, and in 1865 the Basutos felt strong enough to attempt another incursion. The Boers mustered in force and, driving Moses and his people into the mountain stronghold of Thaba Bosigo, laid waste the whole country. Thousands of the Basutos perished of hunger. In April, 1866, Moses signed a new treaty of peace which transferred to the Boers a large section of Basutoland. The Basutos, however, remained on the ceded tract, on the pretext of gathering the harvest, until the Boers, perceiving that they intended to break their engagement, again took up arms in August, 1867, and would have totally annihilated the Basuto tribe if the Governor of Cape Colony had not interfered. The Boers were informed that the Basutos had been at their request received as British subjects, March 12, 1868. Baffled and indignant, they were obliged to accept the treaty of Aliwal, in February, 1869. This deprived them of the compensation for their losses and the fruit of their victories, but on the other hand took from the Basutos a strip of land of which they had been in undisputed possession prior to 1865.

As long as the Governor's agent was the only British authority in the newly annexed Basutoland, all went smoothly. When six magistrates were sent to supplement and restrain the authority of the six sub-chiefs, signs of dissatisfaction appeared. The discovery of diamonds in the northwest part of the Orange Free State in 1869, and the annexation of this district by Great Britain in November, 1871, gave another turn to the fortunes of the Basutos. High prices were paid in Kimberley for all the maize, oats, and barley they could raise, and the young men who went to work by thousands in the diamond-fields returned in a few months with breech-loading rifles and with money in their pockets. Reduced to a mere remnant, impoverished and degraded, the Basutos increased in numbers to nearly 180,000 in 1875, and in wealth in an astonishing progression, possessing in that year 85,000 horses, 217,000 head of cattle, 300,000 sheep, 215,000 goats, and paying as much as £16,500 in direct and indirect taxes.

By the action of the Cape Parliament in 1871, the annexation of Basutoland was approved; but upon the adoption of responsible government in the following year the question whether the colony should accept the incorporation or repudiate the act of the Governor and cut loose from Basutoland was reopened. The colonists were not inclined at first to refuse the responsibility, as the Basutos were not only increasing rapidly in wealth, but through the efforts of the French, and now of English missionaries, advanced rapidly in knowledge and refinement. In 1877 the war with the

Gaikas and Gulaekas of British Kaffraria broke out. The circumstance that a large portion of the hostile Kaffirs were armed with rifles, opened the eyes of the British to the mistake of allowing the sale of fire-arms in Kimberley to colored persons. The Cape colonists, remembering that they were surrounded by unfriendly natives, and that the blacks outnumbered them two to one within their own borders, were carried away with the mingled feelings of panic and arrogance which any collision with the natives awakens in English settlers. The Cape Parliament passed a law which not only restricted the sale of arms to natives, but required a large portion of them to deliver up the rifles which they already possessed. Soon after the close of the Gaika war the Basutos were commanded to comply with the disarmament. To require these peaceable and faithful subjects to give up for a nominal compensation the arms which were their proudest possession, which they had earned with months of toil in the scorching sands of the diamond-diggings, and which they had official permits to purchase and keep, was to them both an injustice and an indignity. Some of them delivered up their fire-arms to the half-dozen officials, for which they were rewarded with the epithet of "loyal," but the great majority paid no attention to the proclamation, and were dubbed "rebels." Negotiations with the recalcitrant Basutos, in part carried on in person by the Prime Minister without result, made their refusal appear in a more serious light, so that the Cape Government felt driven to compel obedience by military force. The British Government had taken a stand against lending English troops to fight any more "little wars" for the colonists in South Africa. The Cape Colonists had an opportunity, therefore, of putting to the trial their new conscription laws. Every citizen between 20 and 45 years of age owes military service, those between 20 and 30 being subject to the first, and the rest to a second levy. The magistrates were directed to select the quotas by lot. The law was very loosely administered. Many of the substantial citizens were exempted on a specious excuse of corporal disability, and most of those who were drawn sent purchased substitutes. An army of from 8,000 to 10,000, lacking training and military experience, and without the first notion of discipline and obedience, was thus collected and sent into Basutoland. The rain fell incessantly in the summer season of 1880-'81, fuel was not obtainable, and, except raw meat, all food was very scarce. The Basutos harried them, but avoided a close engagement. Under the privations and the wearying guard duty the army began to melt away, whole companies deserting and returning to their homes without penalty or disgrace. Despairing of chastising the Basutos with such troops, the government, sustained by a growing sentiment in the country against the disarmament

act and the war, concluded a peace with the Basutos by which everything was left as it was before the war.

The triumphant Basutos felt a natural contempt for the poor-spirited or treacherous members of the tribe who had sided with the British. Toward the end of 1882 one of the rebel chiefs fell upon a loyal Basuto, took his cattle, and put to death his women and children. In this condition of affairs, the presence of British resident magistrates and police whose authority was despised was only a sign of impotence. The Parliament was summoned to an extraordinary session in January, 1883, for the consideration of a ministerial proposition to recall the resident authorities and leave the Basuto nation complete independence in the management of its internal affairs, reserving simply the control of its external politics, that is, its relations with the Orange Free State. With a slight modification the act was passed by a bare majority. The cost of the inglorious Basuto war of 1880-'81 was about £1,000,000. The sub-agents were not recalled. The policy of the Government was defined by the Premier, T. O. Scanlen, to be to build up a government by which the people would be able to manage their own affairs. He admitted that, if they failed in the new experiments, there was no course left but abandonment.

Mr. Scanlen had many conferences with the chiefs, ending with a *pitso* or assembly at Matsieng, on the 24th of April. Letsea and the friendly natives accepted the Government proposals, but Masupha and other malcontents angrily refused to accede to the new scheme of modified supervision. At a conference called by the agent of the Cape Government only about 2,000 persons were represented. Convinced that the Basutos desired to have no further connection with the colony, the Cape authorities concluded to terminate relations with them, and hand over the responsibility for the future management of the troublesome dependency to the British Government. As Cape Colony thus laid down the task of governing Basutoland, which had cost more than £3,000,000, and since the Basutos were not able to stand alone, the Imperial Government announced its willingness to take them again under its control and protection, as prior to 1869, on the conditions that the great majority of the Basutos desired it; that they and Cape Colony should bear the principal part of the expenses, and that the Orange Free State should co-operate in keeping order along its boundaries. The British Government did not propose to establish a costly administration of Europeans and govern Basutoland as a crown colony, but to guide and protect the natives in governing themselves in accordance with their own customs. Cape Colony undertakes to pay £20,000 a year toward the expenses of administration. The bill ratifying the arrangement passed the Cape Legislature in July, after a

prolonged discussion. In order to be further relieved of its financial embarrassments, the Cape ministry would be glad to transfer to the crown the Transkei also, with its large population of Kaffirs.

Natal Legislation.—A change was made in the Constitution of Natal, approaching self-government. The number of members in the Legislative Council was increased from 20 to 30. The elected members bear nearly the same proportion to the nominated members as before, being 23 to 7, as against 15 to 5. The franchise, which was confined to holders of real estate of £50 value, or £10 rental, is liberalized, the limitations being a residence of three years and the possession of an income of £96 a year by male British subjects or naturalized aliens. From natives an educational test is required in addition.

Zululand.—Oetewayo was reinstated in his kingdom on Jan. 29th, in the presence of a concourse of Zulus, but he was only given a segment of the territory over which his rule formerly extended. The chief Usibepu was left in possession of the district allotted to him. It was left free to all the chiefs and people to return to their allegiance to Oetewayo, or to receive lands outside of his kingdom. For such a large section, called the Zulu Native Reserve, was set apart.

The restoration of a portion of his former dominions to Oetewayo turned out to be as great a blunder as the other acts of the British Government in connection with Zululand. Instead of leading to the tranquilization of the country—which the British by splitting it up into petty dominions under thirteen different chiefs, had involved in chronic guerilla warfare—the result was an internecine conflict between Oetewayo on the one part, and Usibepu, in league with all the adversaries of the restored monarch, on the other. Oetewayo was anxious to avoid fighting, but the English in Natal and his rivals in Zululand were determined to destroy, while his hot-headed partisans were not averse to the struggle.

Not many weeks after the return of Oetewayo the Usutu party, composed of the younger and more ardent partisans of Oetewayo, marched in a large body, mustering 80 companies, against Usibepu in the northeastern corner of Zululand, the chief who, under the Wolseley settlement, received the wives of the imprisoned king. Usibepu withdrew before the superior force into the bush in the heart of his country, where he prepared an ambush for the invaders. While he lay in waiting with 20 companies and his picked guard of five companies, called the *Mauhlagazus*, small bands flying before the Usutus led them on, flushed with victory and burning the abandoned kraals, into the ambuscade at Baugonono kraal. Usibepu fell upon the advancing column without warning. In accordance with Zulu tactics, he closed in on half of the army, and cut it to pieces. The remaining portion fled in a disorganized

roul, followed for a long distance by the Manhlagazus. Cetewayo denied all knowledge and responsibility as to the ill-fated expedition, but he immediately began to drill soldiers for another conflict with Usibepu, until he had about six thousand. When he was moving forward with his force, Usibepu and Oham fell upon him with all their warriors and defeated him with great carnage.

After some preliminary fighting, in which Oham and his warriors were hard pressed by Cetewayo's bands, a decisive battle occurred on July 21st, in which the king's newly organized military force was crushed. Usibepu, with an army equipped with the aid of the people of Natal and partly led by white men, descended upon Ulundi, Cetewayo's capital. The king's army was cut to pieces, all his possessions captured, his town destroyed, and he himself severely wounded. He was carried away into concealment by his people, and was long supposed to have been killed. Umnyamana and the Usutus kept up the struggle until they were reduced by Usibepu and acknowledged his supremacy. Cetewayo kept out of the way of his enemies, and entered into communications with the British relative to surrendering himself into their protection. Finally, when assured of the safety of such a course, he delivered himself up and was taken to Natal in October.

Border War in Bechuanaland.—The Transvaal Boers have severely tried the Liberal Government, which rendered back to them their independence, by continuing their encroachments in Bechuanaland and assisting the chiefs who were friendly to them to drive the allies of the British off their lands. The troubles in Bechuanaland,* which lies on the west and southwest of the Transvaal, date back to 1872-'73. After the discovery of diamonds in 1871, Great Britain, which had recognized the independence of the two Boer republics in 1852 and 1854, and by the Sand River Convention had bound itself never to encroach north of the Vaal river, broke the treaties by annexing the diamond-fields, and began its interference in the affairs of Bechuanaland. The Bechuana nation was divided into two parties, one headed by the chiefs Montsiva and Mankoroane and the other by Moshette and Massouw. Mankoroane, chief of the Batlapins, and Massouw, chief of the Korannas, laid

claim to the same territory, while Montsiva disputed with Massouw the position of paramount chief of the Baralongs. The South African Republic recognized the claims of Moshette and Massouw, and by virtue of having subdued Moselekatsie, the Matabele conqueror of the country, and of a cession executed by the chief of the Korannas, the most ancient inhabitants, took the country under its protection by annexing it to the Transvaal state. The British Government, by the Keate award, refused to recognize the annexation, gave a portion of the country to Mankoroane, and acknowledged Montsiva as paramount chief of the Baralongs. This award, if not made in the interest of white land-speculators, had the effect of delivering the country over to their machinations and prolonging the tribal disputes. Bechuanaland was to have been reunited with the Transvaal upon its annexation, through Sir Theophilus Shepstone, to British South Africa.

In the Transvaal war which resulted from this act, Montsiva and Mankoroane sided with the British and aided them by furnishing shelter and supplies, although the direct military assistance of the blacks was refused by the English. Moshette and Massouw sympathized with the Boers. In the convention of 1881, by which the British under the auspices of the Liberal party withdrew from the Transvaal, a new boundary-line was drawn. This line cut off a large portion of the annexed territory from the Transvaal and even separated from the Boer state a number of farms and settlements belonging to its citizens. It was objected to and declared impracticable at the time of signing the convention, and has been the subject of frequent reclamations since. The British Government paid no attention to these diplomatic representations. Bechuanaland was at once plunged into warfare and anarchy by the boundary settlement insisted upon by the British Government for the sake of their native allies and the white abettors and advisers of the latter. Montsiva ordered Moshette and Massouw to vacate their lands and find homes within the new boundary-line of the Transvaal. In league with Mankoroane he made war upon them in May, 1881, to compel them to give up the disputed territory. The white volunteers and speculative fomenters of the war who were engaged on both sides were to be paid in farms in the rich pasture-lands of the disputed territory. There was a brief cessation of hostilities; but when the war broke out again in October of that year the Boer filibusters or volunteers took an important part in the operations on the side of chiefs who were in possession.

The Boer Government agreed to place a guard on the frontier, to prevent Boer volunteers from crossing, but their efforts to preserve neutrality lacked earnestness or efficiency. Montsiva and Mankoroane were defeated and forced to sign a treaty, in 1882, which

* The Bechuana are the negroes among whom Moffat and Livingstone labored. They are akin to the Basutos in race, and are more intelligent and far more advanced in civilization than the other Kaffir races. They have schools and churches, are clothed, and many of them are to some extent educated. They have separate property in land, and had made considerable progress in industry and agriculture before the Trek Boers arrived in the country north of the Vaal. The chiefs, unless they led the people in the arts of peace, lost their power and influence. Many of them, including all of the four leaders in this intestine conflict which was provoked by white adventurers, have at various times requested the British Government to take their country under its protection. Nearly all of the internal quarrels of the Bechuana are over disputed claims to chieftainship. They are not of a predatory disposition like the Kaffirs in the east, and have never committed cattle-raids in the Transvaal.

placed their territory under the protection of the Transvaal, and granted lands to Boers who had taken part in the war. This treaty lacks the ratification of the suzerain power. The frontier war did not cease. English filibusters rushed in, on the pretext of supporting the cause of the worsted party. The white participants increased, until Bechuanaland was occupied by adventurers from the Transvaal, the Orange Free State, and the English colonies. The cattle and the lands adjacent to the streams were taken away from the natives belonging to the defeated party. Many of the Bechuanas were reduced to starvation. The Transvaal Government excused the aggressions of the Dutch on the ground that the boundary-line fixed by the Pretoria convention was unfair and injurious to the Boers. When Mr. Fox, their Secretary of State, was called to account for signing a treaty, he replied that his action was not in violation of the convention, but was the consequence of a defect in the convention.

In February, 1883, Lord Derby, British Colonial Secretary, proposed that the Cape Government should organize a police to prevent the incursion of British subjects into Bechuanaland. Sir Hercules Robinson replied that the only remedy would be to send a military force to occupy the country and clear it of white filibusters. The lands which were seized by the Boers, and from which Mankoroane and Montsiva and their people were expelled, were those which they had formerly held, but of which the Pretoria convention had deprived them. The pretended volunteers of Moshette and Massouw who retook the lands by force, had the approval of the Transvaal Government and people, and the sympathy of all the Dutch in South Africa. When Sir Hercules Robinson proposed that the disturbed district should be guarded by a mounted police, the expense of which should be divided between the British Government, the Cape of Good Hope, the Orange Free State, and the Transvaal Republic, the Cape Government were unwilling, the Orange Free State declined on the ground that its Constitution forbade such a use of its forces, and Triumvir Kruger answered for the Transvaal that his colleagues were absent, at the same time expressing his surprise that a remedy should be proposed that was worse than the disease, and saying that the cause of the difficulty is the boundary-line fixed by the convention. A commission constituted by the Volksraad, the 3d of June, 1882, to put an end to the controversy, was instructed to regard the boundary as established in the dis-

allowed treaties with Moshette and Montsiva.

Mankoroane, no longer lord of his territory, which was in part apportioned out among the white volunteers, made a formal appeal to the British Government to annex his country. On the confines of the Transvaal the marauders, Dutchmen from all parts of South Africa, and English adventurers, many of them deserters from the British army, had set up an independent republic, under the name of Stellaland, and elected a president of their own. This community of outlaws numbered about 2,000 souls.

CARLISLE, John Griffin, an American statesman, born in Campbell co., Ky., Sept. 5, 1835.

JOHN GRIFFIN CARLISLE.

He received a common-school education, and became a teacher. Afterward he studied law, and in 1858 was admitted to the Kentucky bar, where he gradually built up an extensive and lucrative practice. He was elected to the lower house of the Legislature in 1859, and to the State Senate in 1866 and 1869. He was a delegate to the National Democratic Convention held in New York in 1868, he was Lieutenant-Governor of Kentucky from 1871 to 1875, and in 1876 was a presidential elector. He was elected to Congress the same year, taking his seat in March, 1877, and has been a member ever since. He soon became prominent as

a Democratic leader, especially as a member of the Committee of Ways and Means, and attracted attention by an able speech on revenue reform. This and the revival of American shipping he looks upon as the important questions now before the country. In the speech referred to he said: "In the broad and sweeping sense which the use of the term generally implies, I am not a free-trader. Of course, that is understood. At least it should be. I will add that in my judgment it will be years yet before anything in the nature of free trade would be wise or practicable for the United States. When we speak of this subject we refer to approximate free trade, which has no idea of crippling the growth of home industries, but simply of scaling down the iniquities of the tariff schedule, where they are utterly out of proportion to the demands of that growth. After we have calmly stood by and allowed monopolies to grow fat, we should not be asked to make them bloated. Our enormous surplus revenues are illogical and oppressive. It is entirely undemocratic to continue these burdens on the people for years and years after the requirements of protection have been met and the representatives of these industries have become incrustated with wealth. This is the general proposition on which I stand." On the organization of Congress in December, 1888, Mr. Carlisle received the Democratic nomination for Speaker of the House of Representatives, and was elected.

CARPETS. Progress of the Industry.—No better carpets are made in America now than were made twenty years ago. Indeed, as early as 1851 an American inventor—the late Erastus B. Bigelow, of Massachusetts—showed English weavers (who were then making more and better carpets for general use than any other people) that success in weaving body-Brussels carpets by power had been fully achieved in America.

Specimens of Bigelow Brussels carpets were exhibited at the Great Exhibition in London in 1851, but not till after the prizes had been awarded. In a supplement to their report the jury said: "The specimens of Brussels carpeting exhibited by Mr. E. B. Bigelow are woven by a power-loom invented and patented by him, and are better and more perfectly woven than any hand-loom goods that have come under the notice of the jury. This, however, is a very small part of their merit, or rather that of Mr. Bigelow, who has completely triumphed over the numerous obstacles that presented themselves, and succeeded in substituting steam-power for manual labor in the manufacture of five-frame Brussels carpets. Several patents have been taken out by different inventors in this country for effecting the same object; but as yet none of them have been brought into successful operation; and the honor of the achievement, one of great practical difficulty as well as of great commercial value, must be awarded to a native of the United States."

The Centennial Exhibition.—The American Centennial Exhibition gave a great and lasting impetus to carpet manufacture; the exhibit of foreign carpets stimulating our manufacturers, color artists, and weavers to an emulation which, in the brief period since elapsed, has transformed a struggling industry into one of the most stately proportions. This expansion has been evidenced in Philadelphia especially by the remodeling of old and the erection of new factories, the undertaking of hitherto rare and costly fabrics, and the substitution on an extensive scale of power for hand looms.

Looms.—English manufacturers adopted the Bigelow patents, and till within a recent period continued furnishing us with body-Brussels carpets for which we had first provided them a power-loom. At home, meanwhile, the Bigelow Carpet Company held fast to their discovery, and remained, until the lapse of their patent-rights, the principal power-loom body-Brussels weavers in the United States.

It is safe, too, to assert that all looms now employed in England and the United States in the weaving of body-Brussels, Wiltons, and tapestry-Brussels carpets may be traced, in the principles of their construction, to the original Bigelow loom. This is largely true, too, of ingrain-weaving. Mr. Bigelow invented a loom for ingrains, which produces a fabric of great excellence, and is now in general use in the older New England factories. Besides the Bigelow Company, two manufacturing firms, E. S. Higgins & Co., of New York city, and John and James Dobson, of Philadelphia, are entitled to the distinction of first undertaking on a large scale the production of high-grade power-woven carpets in America. Indeed, E. B. Bigelow's patent for weaving body-Brussels and tapestry carpets was first employed by E. S. Higgins & Co. on tapestries only, and subsequently the present Bigelow Company applied the invention to Brussels and Wilton fabrics. In Philadelphia, no carpets other than common ingrains were made prior to 1872.

Since Mr. Bigelow's time but one ingrain-loom has been invented in the United States which has proved wholly free from objection, and been regularly adopted. This is known as the "Murkland loom," the invention of William Murkland, of Massachusetts, who died a few years since. The Murkland loom is noted for its fine shading qualities, for its great productiveness, ease of manipulation, and general adaptation to ingrain-weaving, to which it is confined. It is now used almost wholly by new manufacturers.

Equally ingenious, though less adapted to general use, was the Duckworth ingrain-loom, produced under the patronage of Messrs. E. S. Higgins & Co., by John C. Duckworth, a young inventor who died in 1882.

A signal triumph, and by far the most important, lately achieved in America in mechanism for high-grade carpet-weaving, was the loom

for moquette carpets, invented and patented by Halcyon Skinner, of the Alexander Smith & Sons Carpet Company, at Yonkers, N. Y. A loom capable of such results as the Skinner loom produces, emphasizes strongly our singular success in first furnishing power-loom to makers of fine carpets in other lands.

New Fabrics.—Since the Centennial Exhibition three important additions have been made to our carpets. These are the moquette, chenille-Axminster, and Smyrna fabrics.

Moquette is made by power, the two latter by hand, only. Moquette ranks among the best and most luxurious of pile-fabrics, being singularly receptive to colors, and capable of the most subtle and pleasing color treatment. Upon its introduction, the mystery and glamour which had long attached to the finer carpets manufactured abroad quite vanished.

Chenille-Axminster, long known in England, is made in Philadelphia, but only on the most limited scale. It ranks second to none in many elegant essentials, but can not take its proper rank until made by power. A loom for this purpose has recently been perfected by an English firm.

Smyrna, a very thick, reversible chenille fabric, resembling in texture certain Turkish carpetings shown at the Centennial Exhibition,

was easily reproduced here, and has rapidly found favor with American dealers and consumers. It is made almost wholly in Philadelphia, and, though made in lengths for sale by the yard, it is most used in rugs. The Government departments at Washington have adopted this new and useful covering.

Statistics.—Carpet-weaving in America has so advanced within the past few years as to render the exhibit of the census of 1880 wholly insufficient as a basis upon which to estimate the present magnitude of the industry. During the past four years, in Philadelphia alone, numerous extensive carpet-factories, many of them of imposing proportions, have been erected and put in motion, while in New England the Lowell, Hartford, Bigelow, Roxbury, and Worcester companies, the Sanford Mills at Amsterdam, N. Y., and the Alexander Smith & Sons Carpet Company, at Yonkers, have each added very materially to their structures and manufacturing facilities. Vastly more of capital and labor are now employed in varieties of fabric, richness and excellence of texture, and consequent increased value of annual product, than at any period of our history. With this caution, we append for comparison the census statistics of the United States relating to carpets for 1870 and 1880:

CARPET MANUFACTURES (OTHER THAN RAG) OF THE UNITED STATES.

	Factories.		Hands employed.		Capital.		Value of product.	
	1870.	1880.	1870.	1880.	1870.	1880.	1870.	1880.
Connecticut.....	8	2	1,188	1,654	\$1,530,000	\$3,085,000	\$1,200
Maine.....	..	1
Maryland.....	1	1	19	75	10,000	10,000	\$14,000	50,000
Massachusetts.....	6	7	2,200	3,908	3,250,000	4,687,644	4,457,525	6,887,629
New Hampshire.....	3	..	170	810,000	299,750
New Jersey.....	3	2	147	248	153,000	108,000	193,656	179,500
New York.....	18	10	3,424	5,622	4,251,750	6,422,158	4,976,835	8,419,254
Pennsylvania.....	184	237	4,941	11,048	3,026,500	13,400,000	9,753,171	20,300,445
Other States.....	8	..	19	2,500	4,500
Totals.....	215	260	12,096	22,545	\$12,540,750	\$27,657,504	\$21,761,578	\$37,768,587

Imports.—Government statistics for twelve years past show a steady decrease in the imports of carpets. The following table is from official sources:

IMPORTATION OF CARPETS INTO THE UNITED STATES, 1872 TO 1883 INCLUSIVE.

FISCAL YEARS ENDING JUNE 30.	Square yards.	Value.
1872.....	5,072,247	\$5,797,168
1873.....	3,915,997	4,393,257
1874.....	3,122,508	3,649,549
1875.....	2,814,758	2,643,932
1876.....	1,118,736	1,321,692
1877.....	693,589	674,011
1878.....	273,262	293,339
1879.....	257,636	367,105
1880.....	1,448,585	1,287,481
1881.....	991,947	1,064,076
1882.....	715,568	949,670
1883.....	894,939	1,058,912

The increase in the import values of 1880, 1881, 1882, and 1883 is attributable mainly to the sudden demand (began about 1880) for Oriental rugs and carpet "squares," the "an-

tiques" of which have been eagerly sought for and at prices generally greatly in excess of their intrinsic worth. Present imports are largely composed of these Eastern rugs, the makers of which are striving very particularly to retain America as a permanent market.

Exports.—Excepting desultory shipments to Mexico and South America, the exports of carpets from the United States are as yet small. The two countries named increase their demand each year. In South America our floor oil-cloths are highly esteemed, and the trade with Philadelphia is growing.

Tariff.—The United States tariff act of 1882 reduced considerably the duties formerly imposed on foreign carpets, and has resulted in the formation of a national association of manufacturers, whose object is to deter further legislation of the kind and to look generally to the conservation of the industry. Since the passage of the act referred to, certain English carpets, which had wholly disappeared from

our markets, have again been offered and sold here, but at prices not below those asked for similar goods of American origin.

Location of Factories.—The late A. T. Stewart lived to see the decadence of the trade in foreign carpets (first largely undertaken by him in New York), and, determining on manufacture, built, just prior to his death in 1876, an extensive carpet-factory at Groversville, Dutchess co., N. Y. The first roll of carpet from his looms was finished about the day of his death. The Glenham Carpet-Mills, such being their name, now have a capacity for operating 200 power-looms, and for producing annually 2,000,000 yards. Body-Brussels, Wilton, tapestry-velvet, and tapestry-Brussels carpets, also rugs and mats of the same fabrics, besides ingrain carpets, are produced by the Stewart Mills.

It is noteworthy that while New York city distributes through its jobbing houses the greater percentage of the carpets made in the United States, yet only one carpet-factory of importance—that of E. S. Higgins & Co.—exists in the city proper. This was among the first important factories established in the United States, and has expanded into enormous proportions, covering now several acres of ground, and giving daily employment to more than two thousand persons.

The particular locations of factories comprised in the preceding statistics, also the several carpet fabrics made at each point in the several States, are substantially as follow:

LOCATION.	No. of factories.	Fabrics produced.
Philadelphia, Pa.	237	Body-Brussels, Wilton, tapestry-Brussels, ingrain, and Venetian.
Baltimore, Md.	2	Ingrain wool carpets and jute matting.
Little Falls, N. J.	1	Tapestry-velvet, Wilton, and Smyrna.
Paterson, N. J.	1	Jute carpets and matting.
New York, N. Y.	1	Body-Brussels, tapestry-Brussels, Wilton, and ingrain.
Brooklyn, N. Y.	1	Jute carpets and matting.
Yonkers, N. Y.	1	Moquette and tapestry-Brussels, and rugs of same.
Poughkeepsie, N. Y.	1	Ingrains.
Elfton Glen, N. Y.	1	Ingrains.
Amsterdam, N. Y.	2	Tapestry-Brussels (extensively), tapestry-ingrain, body-Brussels.
Auburn, N. Y.	2	Ingrains.
Bridgeport, Conn.	1	Ingrains.
Hartford, Conn.	1	Body-Brussels, Wilton, and moquette.
Roxbury, Mass.	1	Tapestry-velvet and tapestry-Brussels.
Clinton, Mass.	1	Body-Brussels and Wiltons.
Medford, Mass.	1	Tapestry-Brussels.
Palmer, Mass.	1	Body-Brussels and Wiltons.
Lowell, Mass.	1	Body-Brussels, Wiltons, and ingrain.
Lowell, Mass.	1	Ingrains only.
Worcester, Mass.	2	Body-Brussels and Wiltons.

New York city has now one factory making jute carpets.

Advance in carpet-weaving since 1870, at points other than Philadelphia, has been shown more by enlargement of the old factories and the making of new fabrics than by the starting

of absolute new industries. In Philadelphia, not only have these improvements been observed to a most remarkable degree, but new factories, considerably more than the last statistics disclose, and of a most important kind, have been added to the old. The factories, too, reckoned as such in the census of 1870 were, in reality, many of them petty ingrain mills, employing rude hand-looms and producing a low grade of goods. These have largely been transformed into dignified industries, power being used instead of hand-weaving, and better goods produced. In Philadelphia, twelve years ago, only ingrain carpets were made; now there is no fabric known to the art, save the one of moquette and the productions of the East, which does not leave Philadelphia looms.

The annexed table shows the comparative state of the industry in Philadelphia in the two years, 1870 and 1882, according to the United States census and the city census respectively:

COMPARISON OF RETURNS OF CARPET MANUFACTURES IN PENNSYLVANIA (BEING PHILADELPHIA).

	1870.	1882.
Establishments	184	297
Number of persons employed.	4,941	11,043
Capital	\$3,169,500	\$12,400,000
Wages	1,910,968	4,085,920
Product	9,785,787	20,200,445

Rugs.—Notwithstanding the positive revival apparent in the use of rugs, both as accompaniments and as substitutes for carpets, the number of American manufacturers who seriously undertake the production of fine rugs has been surprisingly small. The Glenham Mills (A. T. Stewart's) were, probably, the first regularly to manufacture Wilton, body-Brussels, tapestry-velvet, and tapestry-Brussels rugs, and these to some extent are still continued by them. The Alexander Smith & Sons Carpet Company make successfully moquette and tapestry-Brussels rugs, and this concern and the Glenham Mills are the only houses in America making in variety high-grade, powerloom rugs. Kitchenman & Neall and A. Cameron, of Philadelphia, weave chenille-Axminster rugs of superior fineness by hand.

Carpet-Wools.—Numerous experiments have proved that wools best adapted to carpets can not be profitably produced, if produced at all, in the United States. The grades most employed are from wild and sterile regions in Russia, Turkey, and Asia, where carpet-sheep and shepherd exist in the most primitive manner. Colorado and Texas yield certain wools which find a limited market in our carpet-mills; but as yet we are mainly dependent upon the sources just named. Strong efforts have been made to influence the remission by Congress of the duties imposed upon foreign carpet-wools, and this, if accomplished, would somewhat cheapen our carpet-product, and would also enable us, it is contended, to compete more suc-

cessfully with foreign companies in an export trade.

Rag and List Carpets.—These, the first floor-coverings made in America, have by no means disappeared. The German settlements of Pennsylvania excel in them, and produce rag carpets the texture and colorings of which show of late years a very decided advance.

Wages.—Carpet-weavers, as a rule, earn good wages, and live in as much comfort as journeymen in any other industry. The factory region of Philadelphia is well provided with comfortable brick dwellings, which rent at reasonable figures, and like satisfactory conditions exist around the mills of New England and New York. Practiced weavers earn fifteen to twenty dollars a week. A large percentage of the weavers are of English, Scotch, and north of Ireland origin or descent, and some of the most conspicuous successes in Philadelphia have been by foreigners, who started there as humble toilers on rude hand looms. Not a few such are to-day the owners of factories of great magnitude.

Noteworthy Events.—Certain important changes which have happened within a brief period can best be illustrated by reference to particular industries: The Alexander Smith & Sons Carpet Company, at Yonkers, from being formerly ingrain-makers only, will, during 1884, have 350 looms engaged on tapestry-Brussels, and 218 looms on moquette carpet; the whole having a total daily capacity of 27,500 yards; 500 hands will also be added, in 1884, to their working-force, making the total of persons employed 3,000. Horner Brothers, of Philadelphia, who in 1876 began on Brussels with six looms, have but just finished a factory of vast proportions, and are now among the largest Brussels producers in the world. They have undertaken, also, the weaving of tapestry-Brussels. John Bromiley & Sons, noted ingrain-weavers, of Philadelphia, have of late discontinued all but the Brussels manufacture, and have an extensive factory whose foundation was laid in the humblest way. John & James Dobson, at the Falls of the Schuylkill, have now body-Brussels, Wiltons, velvets, and tapestries on their lines, and conduct an industry famous here and abroad for its magnitude and the variety of its products. McCallum, Crease, & Sloan, of Philadelphia, one of the oldest and most successful firms making ingrain only, now weave Brussels and Wilton carpets of the highest standard, and are just completing an extensive factory. Ivens, Dietz, & Magee, Philadelphia, have completed and entered a stately Brussels and ingrain mill, and will reintroduce a costly fabric once made by them, known as tapestry-ingrain. The Lowell Manufacturing Company, at Lowell, Mass., have of late doubled the number of their Brussels-loom, enlarged their mill, and placed themselves in the front rank on this fabric. The Hartford Carpet Company, in addition to Brussels and ingrain, has begun the manufacture

of moquette, and alone shares the honor with the Smith Company, at Yonkers, of making this fabric in the United States. Hon. Stephen Sanford (Amsterdam, N. Y.) has reared an industry of great extent, employing 200 looms on tapestry carpets.

These facts indicate, not the movements merely of individuals and firms, but are cited rather to show recent enterprise in directions limited a few years since to the efforts of perhaps a half-dozen firms. The achievements of numerous others, though hardly less signal, must of necessity be omitted here.

Cocoa-Matting.—Floor-matting and foot-mats made in East India from the cocoa-fiber, and formerly imported fully manufactured from that country, are now woven equally well in America, and factories are successfully employed on these goods in Brooklyn, N. Y., Philadelphia, and Chester, Pa. Cocoa-fiber is admitted into the United States free of duty, and the fabrics made from it are found preferable to those produced in India.

Floor Oil-Cloths.—The consumption of floor oil-cloths, which diminished considerably with the cheapening of carpets, has revived very greatly, especially in the South and West, and the annual yield of the medium class of goods is greater by far than at any former period. The floor-cloth industries of the several States are as follow: Maine, 8; Massachusetts, 2; New York, 6; New Jersey, 4; Pennsylvania, 8; total in the United States, 18. There is also on Long Island, N. Y., a factory engaged in making linoleum, a cork floor-cloth, used for like purposes as the ordinary floor oil-cloth.

The jute fabrics, or "foundations," used in the manufacture of floor oil-cloths, are imported mainly from Scotland. The Dolphin Company's jute-mill, at Paterson, N. J., and that of the Planet Mills, in Brooklyn, N. Y., have each successfully made the canvas on which the wide cloths, 18 to 24 feet in width, are prepared. The Chelsea Jute Works, of New York city, for the first time in America, are now about producing power-woven, narrow-width jute canvas or burlap. (See *JUTE*.)

Fewer factories are engaged in making sheet oil-cloths—goods 12 to 24 feet wide—than existed ten years ago, and the production consequently has been very much lessened. Out of the oil-cloth factories enumerated, three only give particular attention to the sheet-widths. Narrow-width oil-cloths, 3 to 7½ feet wide, on the contrary, are made in vastly larger quantities than ever before, their low price and useful qualities rendering them exceedingly popular. A machine for printing the colors, of recent invention, has been adopted by one or two firms, which secures a more rapid production than by the block or hand method of printing.

CENTRAL AMERICA. The following five independent republics constitute the Spanish-speaking portion of Central America:

STATES.	Area in square kilometres.	Population.	Per kilometre.	Active army.	Militia.	Capitals.	Popula- tion.
Guatemala	121,140	1,252,497	10	2,180	82,229	Guatemala.....	58,456
Salvador	18,720	554,795	80	1,400	18,500	San Salvador.....	14,039
Nicaragua	133,500	276,815	2	708	9,600	Managua.....	9,000
Honduras	120,480	380,000	3	248	81,500	Teгуcigalpa.....	12,000
Costa Rica.....	51,760	183,000	4	360	All men between 18 and 55.	San José	12,000
Total	445,900	2,618,100					

There was a plan on foot in 1883 to reunite the five republics in one confederacy, to be called the United States of Central America. This scheme was started in Guatemala, which, under President Don Rufino Barrios, has a tendency to exercise a sort of hegemony over the remaining states, and the idea probably originated in the mind of Gen. Barrios himself, who has an ambition to be elected President of the Union, should the project meet with the assent of the people at large. For the present the plan has failed, owing, as was supposed, to the avowed or secret jealousy and intrigues of Don M. A. Soto, ex-President of Honduras, while he was the executive of that republic. Don M. A. Soto, however, left his country, and retired into voluntary exile in the summer of 1883, residing in San Francisco, California, where he published some letters provoking replies from Gen. Barrios. Finally, he resigned his office. The alleged main obstacle to the projected union thus seems to have disappeared. (See articles on the several republics.)

CEREBRAL LOCALIZATION. The whole tendency of recent anatomical study has been toward greater accuracy in minute details. Such knowledge as was to be gained by the scalpel and forceps in the way of dissection has long since been acquired. The microscope still remains, however, and much is to be learned of the minute anatomy and functions of parts the gross appearances and relations of which have long been understood.

The theory of "cerebral localization," briefly stated, is this: The brain is not a homogeneous organ, but a mass composed of a certain number of diverse organs, to each of which belong certain definite physiological properties and functions. The object of recent study has been to locate these different functions each in its own portion of the nerve-substance of the brain. In a crude way, the general fact of a certain amount of cerebral localization has long been admitted. For example, the sense of sight has been located in a certain portion of the cerebrum, as has the sense of smell in another. The gray matter of the cerebral hemispheres was supposed to be especially associated with mental power, and the amount of the former to be an index of the amount of the latter. The nerve-fibers of the medullary portion and the large ganglia at the base of the brain were supposed to be especially connected with the act of locomotion. Further than this, paralysis limited to the leg had been connected with disease of one of the large ganglia (the corpus striatum) and

the adjacent medullary fibers at the anterior portion of the organ; while paralysis limited to the arm had been similarly associated with disease of another ganglion (the optic thalamus), and the surrounding medullary fibers at the posterior part of the brain. It was known that, when the arm and leg were both affected, the disease would probably be found in the base of the brain, rather anteriorly if the leg were chiefly affected, and posteriorly if the paralysis were greater in the arm. The respective functions of the anterior and posterior tracts of the spinal cord were also known, and the cerebellum or smaller brain, to which the posterior or sensory tracts of the cord were traced, was held to be on this account the especial seat of sensation. In 1868 a still further advance was made in locating the cerebral center of articulate speech. The disease known as aphasia consists either in a loss of the memory of words, so that the sufferer is unable either to speak or write the particular word he wishes to use, or else in a loss of the power to articulate a particular word or words, though the sufferer remembers them perfectly, and can write them correctly. In either of these cases it is evident that the diseased point in the brain must be either at the center controlling the muscles of articulation, or in the center of articulate speech itself. Careful examinations of the brains of such patients resulted in locating the lesion at a certain point in the anterior or middle portion of the frontal lobe of the left side, known as the "island of Reil," and supplied with blood by the left middle cerebral artery. It was at first supposed to follow necessarily from these investigations that the function of speech was confined to the left side of the brain; that as speech is learned by use, in most persons only one side of the brain had been educated for that purpose; and that as a person is right-handed as respects movements, he is left-handed as respects the faculty of speech. More thorough study has weakened the supposed force of the first discoveries, and although it still seems to be a fact that in most cases the center of speech is in the left anterior portion of the brain, there have been several reported cases of aphasia in which the lesion was plainly at the corresponding point on the opposite side.

These and a few other similar conclusions constituted about all that was definitely known as to the functions of the different parts of the brain till within the past few years. The field of study has always been attractive, both for

the anatomist and the physiologist, and their labors have been well repaid. The following account of the experiments of Dr. R. W. Amidon, of New York, may be of interest. They were based upon the following propositions: 1. Marked local variations in the temperature of the cephalic contents may be demonstrated by the use of specially constructed surface-thermometers. 2. Cerebral cortical localization is now sufficiently far advanced to warrant the assertion that the psycho-motor centers for one half of the body occupy a certain area in the cerebral cortex of the opposite hemisphere. 3. Functional activity of an organ implies increased blood-supply and tissue-change, and

cured to the head by buckles. The desirable points in the subject to be experimented upon are, a well-shaped head, thin hair, well-developed and trained muscles, power of facial expression, especially of unilateral facial movements, and the ability to contract individual muscles, and moderate intelligence. A man is preferable to a woman, and a European to an African.

The arrangements being completed, the subject of the experiments is made to exercise repeatedly a certain muscle or set of muscles; for example, to move repeatedly the right arm. The thermometer which registers an increase of temperature as a result of the movements is

FIG. 1.—LATERAL VIEW OF THE HUMAN BRAIN, SHOWING ITS LOBES AND FISSURES. (After Ferrier.)

F, frontal lobe; P, parietal lobe; O, occipital lobe; T, temporo-sphenoidal lobe; S, fissure of Sylvius; S', horizontal portion; S'', ascending portion of the same; c, sulcus centralis, or fissure of Rolando; A, anterior central convolution, or ascending frontal; B, posterior central convolution, or ascending parietal; F₁, superior; F₂, middle; F₃, inferior frontal convolution; F₁, superior; f₁, inferior frontal sulcus; f₂, sulcus præcentralis; P₁, superior parietal lobule, or postero-parietal lobule; P₂, inferior parietal lobule, viz.: P₂, gyrus supra-marginalis; P₃, gyrus angularis; p, sulcus intra-parietalis; a m, termination of the caloso-marginal fissure; O₁, first, O₂, second, O₃, third occipital convolutions; p₀, parieto-occipital fissure; α, sulcus occipitalis transversus; α₁, sulcus occipitalis longitudinalis inferior; T₁, first, T₂, second, T₃, third temporo-sphenoidal convolutions; t₁, first, t₂, second temporo-sphenoidal fissures.

consequent elevation of the temperature of that organ. 4. Willed contraction of muscles presupposes an increased activity of the volitional motor-center of those muscles in the cerebral cortex. From this it was natural to make the deduction that voluntary activity in a peripheral part would cause a rise of temperature in the psycho-motor center for that part, which might be indicated by thermometers applied to the skull over such center. Numbers of self-registering surface-thermometers were applied to the surface of the skull to be tested, by passing them through holes in rubber straps se-

supposed to be placed over the part of the brain controlling such movements, and in this way the cerebral center for movement of the arm is localized.

This is but one of the many means of investigation which have been employed in the study of this question. A study of Fig. 1 will show the normal arrangement of a human brain as seen from the side; and Fig. 2 shows what has been accomplished in the way of localization as regards the surface of the organ—what is known in anatomy as the gray matter of the cerebral convolutions, or of the cortex. These

results, as concisely stated by Ranney, may be briefly summarized as follows:

1. The cortex is capable of artificial stimulation, and the functions of certain areas may thus be accurately determined. 2. A well-defined relation exists between the cortex and certain muscular groups. 3. The excitable region of the cortex, where motor effects are chiefly produced, may be said to be localized in the following parts, some of which may be seen by reference to the figure: The center

movements of the forearm and hands (6); for extension and forward movement of the arm and hand (5); centers for complex movements of the arms and legs when acting together (2, 3, 4). The ascending parietal convolution presents, from above downward, four centers for complex movements of the hand and wrist (a, b, c, d), such as the use of individual fingers, etc. The superior parietal convolution presents the center which presides over the movements of the leg and foot, as in the act of

FIG. 2.—SAME VIEW OF THE HUMAN BRAIN, SHOWING THE AREAS OF THE CEREBRAL CONVOLUTIONS. (After Ferrier.)
 1 (on the postero-parietal [superior parietal] lobule), advance of the opposite hind-limb as in walking; 2, 3, 4 (around the upper extremity of the fissure of Rolando), complex movements of the opposite leg and arm, and of the trunk, as in swimming; a, b, c, d (on the postero-parietal [posterior central]-convolution), individual and combined movements of the fingers and wrist of the opposite hand: prehensile movements; 5 (at the posterior extremity of the superior frontal convolution), extension forward of the opposite arm and hand; 6 (on the upper part of the antero-parietal or ascending frontal [anterior central] convolution), supination and flexion of the opposite forearm; 7 (on the median portion of the same convolution), retraction and elevation of the opposite angle of the mouth by means of the zygomatic muscles; 8 (lower down on the same convolution), elevation of the ala nasi and upper lip with depression of the lower lip, on the opposite side; 9, 10 (at the inferior extremity of the same convolution, Broca's convolution), opening of the mouth with 9, protrusion, and 10, retraction of the tongue—region of aphasia, bilateral action; 11 (between 10 and the inferior extremity of the postero-parietal convolution), retraction of the opposite angle of the mouth, the head turned slightly to one side; 12 (on the posterior portions of the superior and middle frontal convolutions), the eyes open widely, the pupils dilate, and the head and eyes turn toward the opposite side; 13, 13' (on the supra-marginal lobule and angular gyrus), the eyes move toward the opposite side with an upward 13, or downward 13' deviation; the pupils generally contracted (center of vision); 14 (of the infra-marginal, or superior [first] temporo-sphenoidal convolution), pricking of the opposite ear, the head and eyes turn to the opposite side, and the pupils dilate largely (center of hearing). Ferrier, moreover, places the centers of taste and smell at the extremity of the temporo-sphenoidal lobe, and that of touch in the gyrus uncinatus and hippocampus major.

for movements of the lips and tongue lies at the base of the third frontal convolution, near the fissure of Sylvius (9 and 10 on figure). On the first and second frontal convolutions there is a center (12) for lateral movements of the head, for elevation of the eyelids, and for dilatation of the pupil. The ascending frontal convolution presents, from below upward, the following centers: for elevation and depression of the corners of the mouth (8 and 7); for

walking. The sensory region of the cortex is confined to the parietal, temporal, and occipital lobes of the cerebrum. In it certain centers have been definitely located by Ferrier which are not as yet accepted as fully proved.

It may be asked whether these facts, which have resulted from physiological experiment and from faradization, are of any practical value at the bedside. Their value may easily be shown. In a case of brain-disease, where

the faculty of speech is affected to any extent, it is safe to conclude that the lesion must be in one of three places nearly connected with each other—the island of Reil, the base of the third frontal convolution, or the white substance lying between the third frontal convolution and the base of the cerebrum. It will also, in most cases, be upon the left side, as already shown. Paralysis of motion affecting only the upper extremity, leads to a location of the lesion on the side of the brain opposite the affected arm, and either confined to or involving the ascending convolutions of the frontal and parietal lobes. In the same way, the affected point may be predicted, with an approach to certainty, in paralysis of the leg, of the muscles of the face, of the eyes, etc. Supposing, now, that a patient affected with certain forms of paralysis, either of motion or sensation, with difficulty of speech, or with a certain variety of strabismus, gives a history of an injury at some time long passed, to the head. The surgeon concludes that as a result of such injury the bones of the skull have become gradually thickened until the pressure of new bone upon the brain-substance is causing the symptoms which he observes. From the muscles and parts affected he is enabled, in some cases with almost absolute exactness, to predict where the thickened bone on the inner surface of the skull will be found, and by the use of the trephine upon this point he may cure the disease—a result which could not be obtained without the accurate knowledge which has resulted from the study of cerebral localization. Abscess in the substance of the brain, following a few weeks after an injury is by no means uncommon. Such abscesses may be treated as abscesses are in other parts of the body, by opening them and allowing pus to escape, provided only they can be located with sufficient exactness, so that the trephine may first be used to remove a portion of the skull and thus allow the plunging of a knife into the brain-substance and reaching the abscess-cavity. Suppose that a person who has been injured on the head develops aphasia, or the loss of words, after a few weeks. The indications are all in favor of the diagnosis of an abscess in the anterior part of the brain on the left side, and an operation at this point may save the patient's life, and has done so.

The surgical importance of these discoveries may be still further exemplified. Thus, if a person receive a severe injury on one side of the head, and there follows a paralysis of the hand and arm on the same side of the body, instead of on the opposite side, any surgical interference is contraindicated; for the reason that, were the injury to the brain confined to the seat of the wound, the paralysis would be on the opposite side of the body; but, being on the same side, it is proved that the brain-injury must be on the opposite side; in other words, that the brain has been extensively damaged, so extensively that the side opposite the point of

injury is also deeply affected, and therefore surgical interference is probably useless. Again, the completeness of the paralysis may indicate that the brain-disease is not confined to the surface, but has involved the deeper portions, and that the operation of trephining is likely to do little if any good.

The celebrated "American crow-bar case," which was for a time looked upon with incredulity as a "Yankee invention," has recently been appealed to as an argument against the fact of cerebral localization, and as a proof that the most extensive injury may be done to that portion of the brain supposed to be the center of voluntary motion, without causing paralysis. The case was that of a man, aged twenty-five years, who was tamping a blasting-charge in a rock with a pointed iron bar three feet seven inches long, $1\frac{1}{2}$ inch in diameter, and weighing $13\frac{1}{2}$ pounds. The charge exploded prematurely, and the bar entered with its pointed end at the left angle of the patient's jaw, passed through the skull and out at the forehead, and was picked up at some distance, covered with blood and brain. The patient was stunned, but within an hour after the accident he was able to walk up a long flight of stairs, and give an intelligent account of the injury to the surgeon who attended him. He ultimately recovered, after an illness which it was supposed must necessarily end fatally, and lived twelve and a half years, dying of epileptic convulsions, without medical supervision. The skull was subsequently exhumed, and may now be seen in the Medical Museum of Harvard University.

The case is generally cited as one in which the man suffered no permanent damage from the injury, either mental or bodily; but a more careful study of it, made by Charcot, proves quite the contrary, and in fact brings it within the ranks of the proofs of cerebral localization. An examination of the parts of the brain which must have been lacerated by the projectile, proves that the whole track of the bar was in the præ-frontal region, and that the absence of paralysis was exactly what should have been anticipated from experimental research. The outer root of the olfactory bulb may also have been injured, and if such were the case there should have been a partial loss of the sense of smell; but on this point the history is silent. There should have been also more or less intellectual disturbance, and on this point the history by Dr. Harlow is conclusive: "His contractors, who regarded him as the most efficient and capable foreman in their employ previous to his injury, considered the change in his mind so marked that they could not give him his place again. The equilibrium of balance, so to speak, between his intellectual faculties and animal propensities seems to have been destroyed. He is fitful, irreverent, indulging at times in the grossest profanity (which was not previously his custom), manifesting but little deference to his fellows, impatient of restraint

or advice when it conflicts with his desires, at times pertinaciously obstinate yet capricious and vacillating, devising many plans of future aspiration, which are no sooner arranged than they are abandoned in turn for others appearing more feasible. A child in his intellectual capacity and manifestations, he has the animal passions of a strong man. Previous to his injury, though untrained in the schools, he possessed a well-balanced mind, and was looked upon by those who knew him as a shrewd, smart business man, very energetic and persistent in executing all his plans of operation. In this regard his mind was radically changed, so decidedly that his friends and acquaintances said he was 'no longer Gage.'"

CHADBOURNE, Paul Ansel, an American educator, born in New Berwick, Me., Oct. 21, 1823; died in New York city, Feb. 23, 1883. He was graduated at Williams College, at the head of his class, in 1848, and became a teacher in Willis's Academy, Freehold, N. J. From

PAUL ANSEL CHADBOURNE.

Freehold he went to the Theological Seminary, East Windsor, Conn., and after graduation went to Exeter, Mass., where he married. His wife and two children survive him.

Mr. Chadbourne next became tutor in his Alma Mater, and in 1853 was raised to the professorship of Chemistry and Natural His-

tory. It is worthy of note that he was also, without giving up his chair at Williams, elected to the same chair in Bowdoin College, and did the duty of both for seven years. He served as professor in the Berkshire Medical College, Mass., and for thirteen years was Chemical Lecturer in Mount Holyoke Seminary.

In 1855 he visited Newfoundland. Two years later he was at the head of a scientific party in Florida; and two years after this he visited Europe. For the purpose of studying the geysers and volcanoes, he extended his tour to Iceland. In 1869 he made a journey to Greenland, for exploration and research.

With all his devotion to science and learning, Dr. Chadbourne was a careful observer of public affairs, and quite as anxious to do his share in this line of duty as in any other. He was elected to the Senate of Massachusetts in 1865, and in 1876 was a delegate-at-large to the Republican National Convention. For the benefit of his health he removed to the West, and was soon after elected President of the

University of Wisconsin. He discharged the duties of this post for three years, and then passed two years in examinations and experiments among the Rocky Mountain mines.

At this date (1872) he was chosen to succeed the venerable Dr. Mark Hopkins as President of Williams College. His occupancy of this office may be called the great work of his life. Under his able and skillful oversight the college prospered greatly; the number of its students was increased, and funds were liberally poured in for its support. He held the office for nine years, with unvarying success, after which he resigned, in order to carry out some extensive literary plans which he was very desirous to execute.

Dr. Chadbourne was first President of the Massachusetts Agricultural College, and in 1882 was re-elected to that post. He also held it at the time of his death. He was a member of the Massachusetts Historical Society, of the Albany Institute, and of other learned societies abroad as well as at home. Two honorary degrees were conferred upon him by Amherst College, and the degree of M. D. by the Berkshire Medical College. He was the author of several books, among which were "Natural Theology,"

"Instinct in Animals and Man," and the "Relations of Natural History." He was chief editor of an elaborate work entitled "The Public Service of the State of New York." He was actively interested in manufacturing enterprises, as well as financial operations, and was a marvel to those who knew the

amount and number of works to which he put his hand and carried through successfully, despite the infirmities of body and the perils of uncertain health. He started for a visit to New York on the 18th of February, but, before leaving the cars, he was seized with what proved to be a fatal attack. He was carried to the residence of his brother-in-law, Mr. A. Schenck, peritonitis ensued, and he died on Friday, the 23d.

Dr. Chadbourne was a man of mark in many ways. As a scholar of varied acquirements, and an educator of rare skill and ability, he has had few equals in his day. Activity and zeal were specially prominent in his career, and his experiences of life were multiform. He was born in Maine, fitted for college in New Hampshire, and graduated at college in Massachusetts. He traveled extensively in his own country as well as in foreign lands. His life was full of adventure, of singular vicissitudes, and of noble, memorable work. He served four institutions of learning, three of them as president. He led parties for scientific exploration and research; he managed large and important business enterprises; and he published a number of learned scientific books. He was a theologian, too, of no mean power, and his mind and heart were at rest in possessing and enjoying those truths firmly held by the denomination with which he was connected.

CHAMBERS, WILLIAM, a Scottish author and publisher, born at Peebles in 1800, died in Edinburgh, May 20, 1898. At the age of thirteen, after receiving the education which the schools of his native town afforded, he was apprenticed to a printer in Edinburgh. Three years later he opened a book-stall, and before 1832, when his brother Robert joined him, he eked out the profits of a small trade by working at case and press, and in 1830 published his "Book of Scotland," an elaborate and comprehensive account of the usages and institutions, the schools, social system, and civil and religious organization of that country. Previous to this time the brothers united in preparing a "Gazetteer of Scotland," which was written in the intervals of business and published in 1832. In February of that year appeared the first number of the "Edinburgh Journal," designed "to supply intellectual food of the best kind, and in such a form and at such a price as must suit the convenience of any man in the British dominions." It almost immediately attained a circulation of 50,000, whereupon the brothers united their business (Robert having also carried on a small book-store) into one establishment. The "Journal" has remained for fifty-two years one of the most widely circulated of British periodicals, and is at present conducted by Robert Chambers, son and nephew of the original founders. In 1834 W. & R. Chambers began the publication of a series of scientific and historical treatises, written in a popular style, under

the title of "Information for the People," the average sale of the numbers of which was more than 100,000 copies. They were followed by the "Biographical Dictionary of Eminent Scotsmen" (1835); "Cyclopædia of English Literature" (1844); the "Popular Edition of Standard English Works," "Papers for the People," "Miscellany," "Repository of Instructive and Entertaining Tracts," and other similar collections—all of which were in a cheap form, and were widely read. "Chambers's Educational Course," which has been completed by degrees, includes works in almost every branch of knowledge, and was followed by "Chambers's Encyclopædia" (10 vols. 8vo, 1860-'68; new edition, 1871-'72)—all of which were in whole or part edited by William Chambers and his brother. The former contributed numerous essays to the "Journal," of which he was for many years after his brother's death the editor, and gave his impressions of the United States in a work entitled "Things as they are in America" (republished in New York in 1854). He was also the author of "Slavery and Color in America," "Peebles and its Neighborhood," "About Railways," "Wintering at Mentone," "Youth's Companion and Counselor," and "Improved Dwelling-Houses for the Humble and other Classes in Cities," suggested by his experiments in improving the dwellings of his tenantry on his estate of Glenormiston, near Peebles. He presented to his native town, at a cost of \$150,000, a substantial building and an excellent library, known as the "Chambers Institution," and served two terms as Lord Provost of Edinburgh. In 1872 he published his last work, entitled "Robert Chambers, with Autobiographical Reminiscences." The crowning act of his long career was the restoration, at a cost of \$150,000, of the interior of the old Cathedral Church of St. Giles, Edinburgh, to its former state of grandeur. Three days before the cathedral was to be reopened with appropriate ceremonies, the restorer was no more. The publishing-house of W. & R. Chambers is the largest in Scotland, employing more than three hundred persons.

CHAMBORD, Comte de (Henri Charles Ferdinand Marie Dieudonné d'Artois, Duc de Bordeaux), the last of the principal line of Bourbons, and, under the laws of the old French monarchy, heir to the throne of France, died at Frohsdorf, in Lower Austria, Aug. 24, 1883. He was born in the Tuileries, Sept. 29, 1820, eight months after his father, the Duc de Berry, son of the Comte d'Artois, afterward Charles X, was assassinated by a political fanatic. The birth of a prince in the continuation of the elder line, the one which preserved, untainted by any compromise with the Revolution, the traditions and principles of the monarchy, was hailed with ostentatious demonstrations by the royalists. The infant received the surname "Child of a Miracle," and was christened Dieudonné, or "God given." A national sub-

scription was opened, and with the proceeds the beautiful castle and estate of Chambord were purchased, and presented to the Prince as a public offering. The title of Duc de Bordeaux was given him out of compliment to the city which was the first to proclaim the Bourbons after the fall of Napoleon. He was now created Count de Chambord by the King, his great-uncle.

The birth of the Prince occurred at the time when a reaction against liberal ideas had set in, the main cause of the revival of royalist ideas being the murder of his father. The Duke of Orleans, who was descended from Philippe of

Orleans were accused of inspiring the crime. When the Duchesse de Berry gave birth to a prince, the report was circulated by the Liberals that the child was a changeling.

The education of Henri was planned to foster in his mind the principles of absolutism and divine right. The chiefs of the ancient nobility, who served him as tutors and governesses, filled his brain with their romantic ideas of the ancient *régime*. When he was in his fifth year his grandfather succeeded the shrewd and prudent Louis XVIII, as Charles X, and the glories of the old monarchy were revived, and, in the exhibitions of royal splendor, the handsome little prince was made a central figure. Dressed in white and blue until he was six years old, in token of his dedication to the Virgin Mary, he reviewed his regiment of hussars, and distributed boons and pardons to suppliant crowds. In 1830 Charles X, with the assistance of his minister, Prince Polignac, attempted to reassume the prerogative of the kings of France. After twice dissolving the Liberal Chamber, he issued an ordinance, on the 25th of July, 1830, abrogating the charter of 1815. At the end of three days of barricade-fighting, the royal troops were beaten by the people of Paris. The Duke of Orleans accepted the crown as King of the French, and the deposed monarch journeyed slowly in royal state to Cherbourg, still expecting to be restored to the throne by an uprising of the provinces, and then set sail with all his family, followed by a frigate, which had orders to sink the ship if she should put back for the coast of France.

The proscribed King set up a court in the palace of Holyrood, at Edinburgh, until the ministry of William IV gave him to understand that there were political inconveniences attending the stay of the royal family in Great Britain. Before settling at Hradjin, near Prague, where they next established themselves, the

Duchesse de Berry, a princess of energetic character and adventurous spirit, undertook an expedition into France, for the purpose of heading a movement to place her son on the throne. With her boy she landed secretly in the Vendée. The plans of the expedition were well laid, and the Legitimists formed in a military body without detection. But the Breton peasants did not flock to the white flag as was expected, not understanding the grounds for upsetting one Bourbon King to establish another. In a single engagement with the King's troops the insurgent band was routed. The Duchess was betrayed into the hands of the Government, and, when confined

COMTE DE CHAMBORD.

Orleans, second son of Louis XIV, and was the son of Philippe Égalité of the Revolution, stood heir to the murdered Duke in default of male issue. He was the hope of the party of liberal-constitutional ideas. Between the throne and the Duke of Orleans were, in the regular line of succession, the Comte d'Artois, brother to the reigning King, the infirm Louis XVIII, and the Comte's surviving eldest son, the childless Duc d'Angoulême. It was in the hope of destroying the elder branch of the Bourbons that the saddler Louvel assassinated the Duc de Berry, under the portico of the Opera-House, Feb. 13, 1820. The Liberal ministers were driven from office, and the supporters of the Duke of

in the Château de Blaye, was discovered to be pregnant, and declared that she had contracted a secret marriage with an Italian, Count Lucchesi-Palli. This episode not only brought the cause of Henri V into ridicule, but separated the young pretender thenceforward from his mother, as Charles X could never forgive her misalliance. Henri, who was safely brought back from the unlucky expedition by faithful adherents, was placed by his grandfather under the guardianship of the Duchesse d'Angoulême, a woman of strong will and masculine nature, while the Duchesse de Berry, who was a princess of Naples, was banished to the land of her nativity.

Chateaubriand, the celebrated expositor of clerico-royalist theories, filled with ideas similar to those which stirred Disraeli, Bismarck, and other statesmen, made the pilgrimage to Prague, in the hope of taking the direction of the young prince's education and bringing him up to become a democratic ruler, who should realize under the old patriarchal forms the popular aspirations of the Revolution, which the *bourgeoisie*, after becoming the dominant class under Louis Philippe, had selfishly forgotten. But democratic ideas were regarded with dread and aversion by the people surrounding the young Duc de Bordeaux. He was trained by his tutor, the Duc de Damas, in doctrines at variance with the whole movement of the century, and in the hope of simply restoring the old order as he was taught to conceive it by clerical guides, who made him believe that the kings of France were all men of saintly character, and that the dalliance of the aristocracy with Voltairian heresies was the cause of the fall of the monarchy. Henri grew up a religious devotee, completely ignorant of the world, and possessing ideas of the religious nature of the kingly office which created astonishment in the courts of Europe, when in his twentieth year he made a tour by the counsel of Cardinal Lambruschini, who feared the effects of his ascetic devotions upon the mind of the Prince. The family lived for some years at Goertz, or Göriz, in Istria, where Charles X died in 1836. When he was twenty-one years old he was thrown from his horse and sustained a fracture of the thigh, which made him slightly lame for life and unfitted him for robust exercise. The same year the Duchesse d'Angoulême purchased the castle and estate of Froschdorf, or Frohsdorf, forty miles from Vienna. The Comte de Chambord (which was the title that the Prince was called by after the expulsion of his family from France) was not able to leave his bed for two years after his accident. Shortly after his own mishap, the popular Duc d'Orleans, Louis Philippe's heir, was thrown from his carriage and killed, leaving the infant Comte de Paris as next heir, with the prospect of a regency under the Duc de Nemours, who was not popular. In November, 1843, as soon as he left his sick-bed, he took up his residence in London, and

publicly called upon his partisans to come and take the oath of allegiance. The Legitimist members of the Chamber and the House of Peers, with thousands of others, flocked to his mansion in Belgrave Square to pay homage to Henri V. A vote of condemnation passed by the Chamber on the conduct of these deputies had the effect of exposing the weakness of Louis Philippe's tenure of the throne and the seeming hopefulness of Chambord's prospects. The censured deputies resigned, and were all re-elected. It became the fashion in Paris to praise the Comte, and rave over the glories of the old *régime*. He strengthened his position and augmented his great fortune by marrying Maria Theresa, daughter of the Duke of Modena, in 1847.

With the brilliant Berryer to lead his party, which grew in numbers and importance up to the Revolution of 1848, there was an opportunity, if Chambord had been daring, unscrupulous, and despotic, and willing to sacrifice his principles to expediency, of obtaining the crown after the ignominious overthrow of Louis Philippe, though scarcely of holding it. But Chambord's lack of courage and decision of character kept him from making the attempt. It was necessary that he should pledge himself to rule constitutionally, a condition which he had already accepted in letters and addresses, and in the columns of his organs.

The communistic outbreak of June decided the fate of the second republic. After its rigorous suppression by Cavaignac, a Chamber was elected containing a strong group of Legitimists, and a large number who were ready to rally around Chambord, provided he would issue a manifesto embodying a charter of popular representation. He appointed many meetings with his political friends, and made frequent promises to adopt this course, but whenever the moment for decision arrived he escaped from his political advisers to meditate in some monastery and take priestly counsel. Prince Louis Napoleon canvassed the country, and secured the election to the presidency. The Legitimists voted for him, to keep out Cavaignac. The Comte de Chambord could not bring himself to renounce the absolutist theory of the monarchy by right divine and the re-establishment of the old ecclesiastico-feudal order. He shrank still more from the employment of military force. There was no hope of re-erecting the old Bourbon throne under any compromise or possible concessions without a sharp, sanguinary conflict with the democracy of the cities. While Thiers, Guizot, and Berryer were laboring to bring about a fusion between the Legitimists and Orleanists, which advanced to the point of direct negotiations with the Comte de Chambord at Wiesbaden after the death of Louis Philippe, and while Marshal Bugeaud, the first general of the French army at the time, held 50,000 of the choicest troops ready to strike at the orders of Henri Cinq, Prince Bonaparte strengthened his grasp on the cen-

tralized administrative machinery, and two years later destroyed the hopes of the royalists by himself establishing an absolute monarchy, and subsequently assuming the duty of defending the temporal power of the Pope. The Comte de Chambord still expected that the French people would fall at the feet of their hereditary sovereign, and accept him unconditionally.

His wavering conduct during this crisis disgusted his adherents. Yet many still upheld his pretensions as embodying the principles of Legitimism. In his comfortable retirement at Frohsdorf, where he maintained a stately court as a king in exile, he entertained courteously all who came from France. He enjoyed sport, following the hunt in a carriage, but occupied his mind chiefly with ecclesiastical antiquities, acquiring a remarkable acquaintance with the shrines of all countries and the religious relics they contained. The imperial court of France always treated him with deep respect, as a means of conciliating the old nobility, who kept aloof from the Tuileries, and after a while he seemed to be completely forgotten. When he abandoned the hope of having children, not only was the chief motive for establishing his claim to the throne taken away from him, but a deterrent sentiment took its place. Like all his family, Chambord hated the house of Orleans. The fall of the empire in 1870 drew him from his retirement at the age of fifty to resume the active rôle of a pretender. The crown was almost thrust upon him by his energetic partisans, and the dangers threatening the Church gave his cause a political significance which was lacking in 1848-'52, but he performed his part in a more reluctant, vacillating, and half-hearted way than before. After Sedan, he issued from Geneva a manifesto bewailing the fate of France, rather than announcing his candidacy. The royalists were politically active in the midst of the war, and the precipitate election of February, 1871, they turned to their advantage.

After the suppression of the Commune, the Comte resided for a time in his castle at Chambord. He wrote a series of letters disclaiming any intention of abolishing the tricolor, or representative government, or political equality, or of reviving church tithes. After launching a second manifesto, he withdrew to Marienbad. On the understanding that the Comte de Chambord would accept the crown as a constitutional monarch, and would appoint the Comte de Paris his heir, the Legitimists pursued their efforts to undermine the Thiers republic, and in the winter of 1872 they went to Bruges to pay homage to the pretender. Thiers declared that he would prosecute the actors in this demonstration, and have Chambord escorted across the frontier if he showed himself in France. On May 24, 1873, the royalist cabal overthrew Thiers, and on the 5th of August the Comte de Paris went to Frohsdorf in acknowledgment of the claims of the head

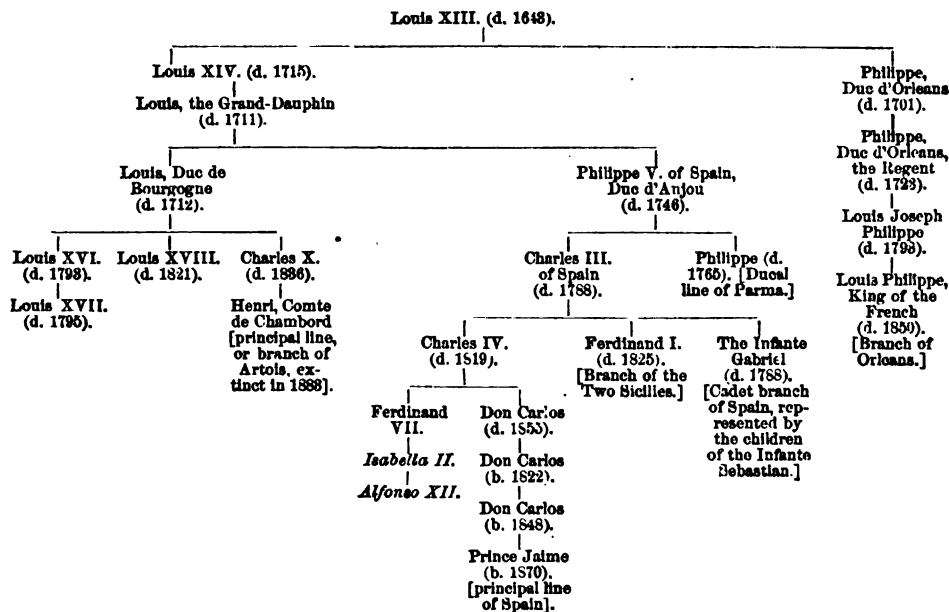

of the family. In October the Comte de Chambord was at Versailles, and everything was ready for the *coup de main* which his friends urged upon him. The royalist majority in the Assembly would hail him King by acclamation, if he would only enter the hall and declare himself; while Marshal MacMahon stood ready to uphold his rights with the army. But he shrank from such a course, perceiving that the French people were not in sympathy with the restoration of the Bourbons. A deputation from the Right waited upon him at Salzburg and made a formal offer of the crown in the name of the parliamentary majority. The Prince, racked by the old questions, wavered and vacillated as before. To the delegates he replied that he accepted the crown, and would leave it to the National Assembly to frame a Constitution. His friends supposed that all difficulties were removed, and state carriages and decorations were ready on the 25th of October for the solemn entry of the King. Six days later his official organ, *L'Union*, published a manifesto declaring that he would never disown the white flag of Henri IV, or consent to become "the King of the Revolution."

The Orleanists were indignant. The republicans praised the Prince for his consistency of character and firmness of principle. The slender group of pure royalists clung still closer to the Comte de Chambord.

The Royal Succession.—The legitimate successor to the French throne is now the Comte de Paris, chief of the Orleans branch, who was formally accepted as such in the meeting between the heads of the two houses at Frohsdorf in 1888. Still the question can be raised by the dwindling party which adheres to the principles of feudalism and absolutism, whether the Spanish Bourbons, who are the eldest branch by descent, do not come legally next in the order of succession, since they are cut off from the Spanish throne.

The cadet branch of Orleans is almost as old as the Bourbon dynasty, being sprung from Philippe, Duke of Orleans, second son of Louis XIII, who was the son and successor of Henri IV, the first of the line. All the other living Bourbons are descended from Louis XIV, the elder son of Louis XIII. The appended genealogical table on page 107 exhibits the relationship of the various branches of the Bourbon family.

The house of Orleans has many living members, descended from Louis Philippe. His eldest son, who was accidentally killed, July 13, 1842, left two sons; the eldest, Louis Philippe, Comte de Paris, born Aug. 28, 1838, has a son, Louis Philippe Robert, born Feb. 6, 1869. His brother, the Duc de Chartres, has two sons. His uncle, the Duc de Nemours, has sons and grandsons; and of his other uncles, the Prince de Joinville, the Duc de Montpensier, and the Duc d'Aumale, the two former have male issue.

CHANZY, Antoine Eugène Alfred, a French general, died in Chalons, January 4th. He was born at Nouart, in the Ardennes, on the 18th of March, 1823. His father was a captain of cuirassiers. He entered the navy at the age of sixteen, and a year and a half later joined a regiment of artillery; was then received into the Academy of St. Cyr, and in 1843 was commissioned sub-lieutenant of zouaves, was given a lieutenancy in the line in 1848, became captain in 1851, and was then appointed chief of the Arab bureau in Hemsan. He became chief of battalion in 1856, fought in the Italian campaign, and as lieutenant-colonel took part in the Syrian expedition. Being promoted to a colonelcy, he commanded a regiment stationed at Rome, and in 1864 was transferred back to Algiers, and became general of brigade and commandant, first of Bel-Abbes and then of Hemsan.

At the beginning of the German war he went to Paris, and asked to be assigned to a command, but Marshal Leboeuf ignored him.

After the surrender of the imperial army at Sedan, and the investment of Paris, when the Government of National Defense marshaled the raw bodies made up of the remaining fighting material of the country, in the hope of still redeeming vanquished France, Chanzy was made a general of division, as most of the superior officers of the army were prisoners of war. After the retirement of General d'Aurelle de Paladines he was selected by Gambetta as "the true soldier revealed by events" to lead this second Army of the Loire in its stubborn resistance.

He has been spoken of as the one great soldier produced by France in 1870-'71, and the magnificent stand he made against the

huge German forces in the region of the Loire gained the respect and admiration of Europe. The quality of his troops at this time was of the poorest, and discipline scarcely existed.

With Chanzy in immediate command under the direction of Gen. d'Aurelle, a new spirit was breathed into this mass. The Sixteenth Corps, joined with the Fifteenth, was now given the name of the Army of the Loire, and, by Nov. 1, 1870, it held the country to the north of the river, between Beaugency, Blois, and Marchenoir. D'Aurelle now resolved to march on Orleans, which had been captured by a raid from Paris, and, if possible, to cut off a Bavarian detachment, which was the only hostile body in his path. For this purpose he advanced his two corps, combining his operations with a French division which was to descend on Orleans from the upper Loire. These movements led to the battle of Coulmiers, the one French victory gained in the war, and though, owing to the delay of the distant French wing, the Bavarians contrived to effect their escape, they were rudely handled and badly beaten. Chanzy was in command of the French left, but, through the mistake of a cavalry leader, his operations were not brilliant.

The apparition of a victorious army perplexed the counsels of the Germans at Versailles; and it is now known that the French commander might have struck with great effect. The Bavarian detachment, not 20,000 strong, was literally the only hostile force between D'Aurelle and the capital of France, and had that general advanced boldly with his 60,000 or 70,000 men, he would almost certainly have crushed Von der Tann, very probably have defeated the Grand Duke of Mecklenburg, who was hurriedly sent off with a

few thousand men to attempt to reach his Bavarian colleague, and might possibly have raised the siege of Paris, for Von Moltke contemplated even this contingency. D'Aurelle, however, fell back on Orleans, his object being to make the position an entrenched camp of formidable strength, and a base for future offensive movements. Chanzy protested against this, urged his chief to advance to the line of the Coulie and be ready to assume the offensive, and especially entreated him to attack in detail Von der Tann, the Grand Duke, and Prince Frederick Charles, as, gathering together from wide distances and presenting their flanks to their collected enemy, these generals slowly converged on Orleans.

By the close of November, the Fifteenth

For this purpose the Eighteenth Corps was prematurely thrown forward on Beaune-la-Rolande, the Twentieth failing to give it support, while the Fifteenth, the Sixteenth, and the Seventeenth were ordered to make what really was a flank march within reach of a foe at this moment all but concentrated. The Eighteenth Corps was at once defeated; and then the Prince, by a masterly movement, combined with his supports on the left, fell on the French center, the Fifteenth Corps, and shattered it after a brave resistance. This stroke forced Chanzy, who up to this time had gained slight advantages, to fall back with the Sixteenth on the Seventeenth Corps; the German commander followed up his success with energy and skill, and the result was that the Fifteenth Corps was all but ruined as a military force; Orleans and the entrenched camp were carried, and the Army of the Loire was rent in twain, the Eighteenth and Twentieth Corps being driven across the river, while the Sixteenth and Seventeenth and the wreck of the Fifteenth were rallied by Chanzy on the northern bank. A succession of false movements had inflicted a ruinous defeat on France; neither the defensive strategy of D'Aurelle nor the bolder plans of his able lieutenant had had a chance to be carried out.

D'Aurelle was dismissed. The divided parts of the Army of the Loire were separated into two bodies, the first army given to Bourbaki, and the second remaining under Chanzy, whose forces had been strengthened by the Twenty-first Corps, and by a flying column from Tours. By Dec. 6th he had placed the army between Marchenoir, Josnes, and Beaugency, having skillfully chosen a strong defensive line, with his flanks covered by a great forest and the Loire. He was forthwith attacked by Prince Frederick Charles, who, having entered Orleans on the 4th and 5th, turned against the enemy hanging on his flank, no doubt confident of easy success; but his calculations were completely baffled. In a series of stern and sustained engagements, Chanzy for four days repelled his assailant, inflicting considerable loss, and though the Prince was reinforced from Orleans by a detachment under the Grand Duke of Mecklenburg, he made no impression on his heroic enemy, until a demonstration from the Loire and Blois placed a German corps on the French rear.

Chanzy's skill was not more remarkable than his confidence and tenacious energy; his presence electrified his young levies, and from this moment he held absolute sway over the hearts of officers and men. The astonish-

ANTOINE EUGÈNE ALFRED CHANZY.

and Sixteenth Corps had been reinforced by the Seventeenth, the Eighteenth, and the Twentieth, and the French army, 200,000 strong, filled the region around and in front of Orleans. The purpose of D'Aurelle was to await the attack of the enemy in his entrenched camp. Gambetta, however, believing himself as capable of directing armies as he was of levying troops, having heard that Trochu was about to make a great effort to break out of Paris, insisted upon a general movement in the very teeth of Prince Frederick Charles.

ing efforts which he made once more disconcerted the strategists of Versailles. The great sortie from Paris had, no doubt, failed; but it had cost the Germans thousands of lives, and the proud city still defied its enemy. D'Anrelle had succumbed with Orleans; but a fresh army had arisen from the wreck, and it had found a chief who could make it accomplish feats that seemed impossible to professional soldiers.

While Chanzy was making his heroic stand, exposed to the whole weight of his enemy's force, Bourbaki did nothing, and declared that he could not detach a man from his quarters at Bourges to aid his colleague. This remissness enabled the Germans to make the movement along the Loire which endangered the flank of Chanzy when it had been found impossible to break his front, and it compelled him to leave his position. The great object of the French Government was to direct a relieving force on Paris, already besieged for four months. Accordingly, Chanzy resolved to ascend from the Loire toward the capital by the northwest, and by the 18th of December the French army was in position around Vendôme.

On Dec. 15th Chanzy was attacked again, Prince Frederick Charles having rightly judged that he was the foe to strike down at all cost. The French made a gallant resistance; but on the second day their right wing was turned, and shattered by an attack in flank. Chanzy decided on a retreat to Le Mans, a strong position upon the Huisne, and a strategic point of no little value, his object being still to attain Paris. He drew off his army without difficulty, and having been re-enforced by a Breton detachment, he reached Le Mans on Dec. 20th. During three weeks of incessant fighting he had held the main German army at bay. Having soon established his army on the Huisne, he threw out posts to the Bruye and the Loire. Meanwhile Prince Frederick Charles had fallen back, holding a long line from Chartres to Orleans, his worn-out troops being in sore distress. A pause in the contest now occurred.

The position of France was very far from hopeless, but another interference of Gambetta's brought disaster. He rejected the judicious scheme of the general, and adopted the fatal project of detaching the First Army far to the east in order to raise the siege of Belfort and reach the German communications with the Rhine. Bourbaki, thus sent off to destruction amid the snows of the Jura, freed Prince Frederick Charles from an enemy on his flank, and enabled him to turn his whole forces against the one chief he had found invincible. Drawing together his army and that of the Grand Duke, the German commanders in the first week in January began to move toward Le Mans and the Huisne. The advanced posts of Chanzy were gradually driven in, though not without a tenacious resistance; but his trust was in his positions on the Huisne, which he had strengthened with remarkable skill, and

he fell back on them with unabated confidence. He had still 90,000 men, against 60,000 or 70,000 Germans; but his troops were not to be compared to their foes. The attack began on Jan. 10th, but the decisive effort was made next day; and the Prince struck home with his full strength. The defense was stern and sustained; Chanzy's tenacity, and his strong positions, made up for the defects of his soldiers, and after ten hours of desperate fighting the French were still in possession of their lines.

A sudden attack, made after nightfall, by a German corps, discomfited the Breton levies, and placed a hostile force on Chanzy's flank. Scenes of confusion and panic followed, an effort to drive away the enemy failed; and Chanzy was compelled to make a general retreat. Although part of the French army disbanded, and several thousand were taken prisoners, it was in tolerable order within two days. By the 20th, having been scarcely pursued, so heavy had been the loss of the Germans, Chanzy was once more in a good position, around Laval and upon the Mayenne, and having been joined by a new corps, he still expected to make, as quickly as possible, good use of his force, and to march to the relief of Paris. But the fall of that city on Jan. 28th, and the catastrophe of Bourbaki's army, prevented him from attempting that march. He received the thanks of the Assembly at Versailles, and held afterward high command.

After the close of the war he was elected deputy to the National Assembly for Ardennes, and became the leader of the Left Center, declaring in favor of the republic from "patriotic and rational" grounds. Gen. Chanzy was reputed to be attached to the cause of the Orleanist monarchists, and it is certain that through his secret protection the Orleans princes entered the army under assumed names, and fought in the final campaign. After he was appointed on the committee of defense, on July 29, 1872, and placed in command of the Seventh Army Corps, he took no further part in political discussions.

On June 15, 1873, he was appointed Governor-General of Algeria, where he had difficulties with his subordinates, and declared a state of siege in the commune of Algiers. On Dec. 10, 1875, he was made a Senator, and in the election for President on Jan. 30, 1879, received 99 votes. On Feb. 18, 1879, he was appointed ambassador to St. Petersburg, his political activity and ambition having awakened distrust in France. He was a *persona grata* at the Russian court, and his suspected royalist proclivities led to his recall toward the close of 1881. From Feb. 19, 1882, he commanded the Sixth Army Corps at Châlons.

CHEMISTRY. Chemical research during 1888 can not be said to have exhibited very marked progress in any one department, nor has it yielded much that is particularly striking in the way of new discoveries. There has been clearly apparent, however, on the part of those

devoted to the advancement of chemistry, a disposition to test the later results of investigation, with a view to the elimination of error, and the compacting and strengthening of the foundations of the science. This is seen in the study and discussion, by eminent authorities, of such questions as the variability of the law of definite proportions; the principles that should govern in the simplification and extension of the nomenclature; the revision of atomic weights; and the verification of old and the introduction of new and improved methods of analysis; while much valuable work has also been done in simplifying and perfecting methods and processes in the several departments of practical and applied chemistry.

Chemical Philosophy.—In a paper presented to the Chemical Society of Paris, Boutlerow alluded to the announcement by Schützenberger, that in analyzing some hydrocarbons, the sum of the carbon and hydrogen was 101 for 100 parts of material; the result under other conditions being normal. The question thus raised, as to whether the law of definite proportions may not, like Boyle's and Mariotte's laws, vary within small limits, Boutlerow has undertaken to examine by a series of experiments. If we disregard the physicist's theory that atoms are definite indivisible particles, the atomic weight of an element represents merely that weight of matter which carries a fixed quantity of chemical energy. The quantity of forms of energy other than chemical is not determined by the mass of the portion of matter in which they reside. The energy may increase while the mass remains the same, as when the velocity of a moving body increases, and it is supposable that chemical energy varies similarly to a very slight extent. This would make possible a variation in the composition of compounds, but the varieties would be identical as far as their chemical properties are concerned. The properties of a compound result simply from the reciprocal action of the mutually saturated combined elements, and this state of saturation would remain unchanged in these varieties, since the quantities of chemical energy acting on each side are still the same, only the mass of the carriers changing. This paper was followed by a statement from Schützenberger of his views on the subject. His researches would seem to show that within the very narrow range through which a body may vary in composition, is a ratio which gives the maximum stability, and this ratio represents the normal composition. Crystallization imposes a rigid constancy of combining proportions, but the composition of bodies can generally be varied by varying the circumstances under which they are formed. Among the cases enumerated by Schützenberger are the following: 1. Hydrocarbons, such as are obtained from Caucasian petroleum, or even turpentine, when burned in a combustion-tube with CuO and a current of oxygen, show always a loss of carbon of 1 to 1½ per cent. when effected at a low

temperature and under circumstances where no carbonous oxide or empyreumatic products could escape. 2. When diamond is burned at a high temperature in pure oxygen, the carbon dioxide formed has oxidizing properties which it does not possess when produced by the combustion of an organic compound at the expense of CuO. 3. Barium carbonate obtained by precipitating baryta-water pure, boiling, by an excess of CO₂, washing and drying at 100°, then at 440°, contains, as Berzelius showed, 21.7 per cent. CO₂ for 78.5 per cent. BaO. Heated to a red heat in a current of dry oxygen, it increases considerably in weight without losing CO₂; and the product gives 22.0 to 22.05 of CO₂ to 76.6 of BaO. 4. Numerous analyses of metallic oxides show variation in composition within narrow limits, according to their mode of formation. HgO derived from the nitrate produces, in oxidizing formic acid, more carbon dioxide than the precipitated oxide. Ferric oxide obtained from the nitrate gives the atomic weight 54 for Fe, from the formula Fe₂O₃; while the ferric oxide obtained by roasting ferrous oxalate gives 56. The same differences are observed with tin, manganese, lead, cadmium, zinc, and copper oxides.

Prof. A. W. Williamson, in his address at the British Association, on "Chemical Nomenclature," remarked that the chief object sought in the nomenclature had been to state in a name, as briefly as possible, certain important facts. The first condition and requirement of a name was that it should call to mind, without ambiguity, some particular thing or one particular idea. The more a name could be defined and shortened the better it would be for chemistry. In the modern progress of the science—particularly in the department of the carbon compounds—the purpose of obtaining clearness and avoiding ambiguity in the nomenclature had been, with few exceptions, satisfactorily attained; but the chief object of convenience had not been reached to an equal extent in giving names to some of the more complex compounds. Some of the names told their story in a manner really free from any ambiguity, but in a very long and inconvenient word. On the other hand, the systematic process had been adopted to a considerably less degree in the names of common substances, which in the case of the older names were based upon facts indeed, but upon facts which were by no means the only ones to be recalled. Other names had grown up which were purely empirical, which did not recall any particular properties, but seemed with great convenience and without ambiguity to indicate the body. It was sometimes proper to change a name under the sanction of new information, but this should be done as little as possible, especially when a name once given had come to be used in relation to a particular substance. When changes tended to introduce confusion, they were necessarily injurious to the progress of

science. The best way to obtain a name was as the result of experiment, and then there could be no ambiguity. Names intended to indicate molecular constitution had better be avoided, because investigations in this direction had not arrived at finality. The chemists of fifty years ago were as confident as the chemists of the present day in the matter of nomenclature; and therefore the more they could obtain names without ambiguity and without liability to change in the future, the more probable was it that such names would stand and continue to be used.

New Substances.—Jannay, working under the direction of Von Meyer, has produced, by the action of hydroxylamine upon various ketones, a new class of organic bodies which he calls acetoxims. The term acetoxim is applied to a body containing the group $\text{ONOH}=\text{}$ combined on both sides with carbon. If hydrogen saturates on one side, a body is formed to which Jannay gives the name aldoxim. The simplest acetoxim is dimethyl-acetoxim, $\text{CH}_3-\text{CNOH}-\text{CH}_3$, or acetoxim proper, analogous to dimethyl-ketone or acetone, and is produced by the action of hydroxylamine upon acetone in the cold in aqueous solution. It is easily soluble in water, alcohol, and ether, fuses at 59° to 60° , and boils at 134.8° . Petraczek has studied the aldoxims in the same laboratory, and describes ethyl-aldoxim $\text{C}_2\text{H}_5\text{NO}$, or $\text{CH}_3-\text{CNOH}-\text{H}$, and others. They are formed by the action of hydroxylamine upon the respective aldehydes.

Von Lippmann has examined the incrustations formed upon the pans in which beet-juice is evaporated. Besides finding in them citric, acetic, tricarballic, and malonic acids, he has isolated a new acid, which was obtained by fractional solution in ether and evaporation. The resulting sirup, after standing two years, became a mass of needle-shaped crystals soluble in water, alcohol, and ether, and having the formula $\text{C}_8\text{H}_8\text{O}_8$. The acid is tribasic, and appears to be identical with the oxycitric acid described by Pawolleck as obtained from chloritic acid.

Divers and Shimosé have obtained a new oxide of tellurium by heating in a vacuum the compound of sulphur trioxide and tellurium until it decomposes. It is a solid body which, on heating, decomposes into tellurium dioxide and free tellurium, and appears to have neither acid nor basic properties. It is stable in ordinary dry air, is black with a brown shade, has a graphitic luster when pressed, is represented by the formula TeO , or a multiple of it, is decomposed by potassium hydrate on boiling, and by hydrochloric and sulphuric acids in the cold, is oxidized readily by nitric acid, and colors sulphuric acid red as it dissolves it, the solution giving a deposit of tellurous sulphate. The same chemists have also obtained, by the action of sulphur trioxide on tellurium, tellurium sulphide, as an amorphous solid, of a beautiful red color, transparent in thin layers, which

softens at about 80° without melting, and is quite stable when kept in close tubes. Its composition is represented by the formula SO_2Te , and it is decomposed by water into tellurium, tellurium monoxide, tellurous acid, sulphurous and sulphuric acid. It appears to exist in two modifications, as the red variety is at 90° converted instantaneously into a brown substance of identically the same composition.

Victor Meyer was led by certain observations to the conclusion that some difference existed between the benzene obtained from coal-tar and that from benzoic acid. He continued his experiments, and succeeded in isolating from coal-tar benzene a peculiar substance containing sulphur, which he calls thiophene. It is a light, limpid, very mobile oil, with a slight odor suggesting that of benzene. It does not solidify in a mixture of ice and salt. It dissolves in concentrated sulphuric acid, giving a deep-brown solution. Its derivatives under the action of various reagents resemble the corresponding derivatives of benzene, and their constitution is similar, except that they are derived from a mother-substance containing sulphur. It is stable toward alkalies and even toward the alkali metals. All commercial benzene contains thiophene.

Dr. Albert R. Leeds has formed from the union of œnanthol with the aromatic bases the oils of closely related physical properties, œnantholamine, a reddish mobile oil of pleasant ethereal smell, œnantholxylidine and œnantholnaphthylamine. The ethereal smell of the latter oil is very pronounced and agreeable, and resembles the odor of pineapple. The processes of the formation of these substances are accompanied by great energy and a remarkable elevation of temperature. The compounds are permanent, and can be sublimed with only partial decomposition. By the sublimation of xylidinaolein was obtained an oil with an unpleasant smell and very bitter taste, which forms crystalline salts with sulphuric, hydrochloric, and other acids. From the hydrochloric salt was obtained an oil of reddish color and unpleasant smell, having the composition of cryptidine. This is the first attempt to isolate this member of the pyridine series, only its salts having been obtained before, and it is of further interest as being accomplished by a process of synthesis.

New Processes.—Dr. A. R. Leeds has described an actinic method for the determination of organic matter in potable water, which he considers more accurate than any of the other methods in common use. It depends upon the fact that compounds of silver are not decomposed by light when they are in solution in water, unless organic matter is present in the water also; and upon the other fact that stable organic bodies, like sugar, starch, gum, etc., have very little influence, while decomposing substances precipitate the silver very rapidly. The amount of silver thrown down can be readily weighed, and the relative amounts of

organic matter present in the water thus determined.

While the method of testing sugar for the presence of starch glucose by the optical saccharometer is satisfactory, it can be applied only by the very few persons who have such an instrument. Mr. P. Casamajor has described a process which can be applied by using such means as are at the command of every one, and is effective for the detection of adulteration with either anhydrous or hydrated glucose, as follows: Take two beaker-glasses, or two teacups; in one put a quantity of the suspected sugar, and in the other put about the same quantity of a sugar known to be refined sugar, free from adulteration. Add, cautiously and gradually, a quantity of water to each sugar sufficient to make each equally and decidedly moist, and stir the sugar to mix it well and get it uniformly wet. Then place both cups in hot water—at any temperature between 50° and 100° C. In about ten minutes the pure sugar will appear more moist than when cold, while the other sugar, if it contains a sufficient amount of starch-glucose, will have sunk into a pasty, sticky mass, analogous to the fill-mass of sugar-refiners. The application of heat is not indispensable, as a difference may be obtained by allowing the two sugars to stand several hours after being moistened, but with heat the effect is immediate, and is much more marked. If the two samples of sugar are allowed to stand in the cups after they have cooled down, the pure sugar will look drier on becoming cold, while the adulterated sugar will continue in the state of a pasty, sticky mass. This test is founded on the property possessed by cane-sugar of forming viscous, uncrystallizable compounds, of which molasses is an example, when mixed with many organic or inorganic compounds, among which are anhydrous and hydrated glucose. As long as a mixture of cane-sugar and starch-glucose is sufficiently dry, it may look fairly enough, as the elements which form molasses are kept from combining by want of water. Hence adulterators are careful to dry their sugars before mixing with glucose. Indeed, one characteristic of adulterated sugars is, that they are drier than refined sugars of the same grade, which are known as coffee-sugars, and are always sold moist.

Peter Claësson proposes a new method for determining sulphur in organic substances by effecting the complete oxidation of the substance in a current of oxygen and nitric oxide—i. e., nitrogen tetroxide gas. A combustion-tube somewhat longer than the furnace is drawn out at one end and bent at a right angle. Next to the bend is placed a roll of platinum gauze; beyond this a boat containing fuming nitric acid; beyond which follow a second and a third roll of platinum gauze, and beyond this the sulphur-boat and a fourth roll of platinum gauze. The bent end of the tube dips into water in a small flask, and the other

end is closed with a stopper admitting the connecting tubes to the oxygen and nitric oxide supplies. After filling the tube with the mixed gases the platinum roll on either side of the nitric-acid boat is heated to low redness, then the boat farthest from the substance. The tube is then heated. The color of the tube between the two boats serves as an indicator; if the red color disappears, the combustion must go more slowly. The nitric acid in the boat acts as a reserve; the hot gases in passing over it always take up enough oxygen compounds to complete the oxidation of any unburned particles. At the end of the combustion the heating is extended forward until all the nitric acid and the sulphuric acid formed in the reaction have distilled over into the flask. After cooling, the contents of the flask and the washings of the tube are evaporated to dryness, and after dilution with water the sulphuric acid is determined as barium sulphate.

C. Böhmer has described a new method of estimating nitric-oxide gas obtained by the reduction of nitric acid. It is based on the fact, which the author had shown in an earlier paper, that chromic acid is an excellent absorbent for nitric oxide. The nitrate or nitric acid is decomposed in the usual way, and the resulting gas, after being dried by calcium chloride, is absorbed in a Liebig's potash-bulb containing chromic acid, and the nitric oxide is determined by the increase in weight.

W. Halberstadt has proposed a new method for the separation of vanadic acid from metals, which is based on the fact that, when a mixture of the acid and metals is heated with ammonium oxalate and acetic acid, the metals are precipitated as oxalates, while the acid sought for remains in solution. The hydrochloric-acid solution of vanadic acid is evaporated to dryness, the residue is heated with a solution of ammonium oxalate in water, and a few drops of strong acetic acid are added till all has dissolved. The liquid is poured into a beaker and heated over a free flame, while acetic acid is added drop by drop—not too rapidly, for then the precipitate is difficult to wash—until the precipitate ceases to form. After filtering off the precipitate and washing with a mixture of equal parts of strong acetic acid, alcohol, and water, the filtrate is evaporated to dryness in a weighed platinum dish, and the residue is heated slowly to expel volatile ammonium salts, and then the remaining vanadium oxide is converted into vanadic acid by heating in a current of oxygen. The method gives good results in the presence of barium, calcium, zinc, or lead, but not with cobalt, nickel, manganese, magnesium, bismuth, copper, or cadmium.

Mollenda determines, volumetrically, the phosphoric acid in superphosphates by finding the amount of a standard solution of sodium carbonate necessary to neutralize the acid phosphate of calcium, which forms the solu-

ble portion of the superphosphate. In order to prevent the precipitation of calcium carbonate from any sulphate of calcium that may be present, the entire amount of calcium is precipitated by sodium oxalate, and the acidity of the resulting mono-sodium phosphate is determined. If free sulphuric or phosphoric acid is present in the superphosphate, sodium carbonate is added before titration, until the liquid becomes slightly turbid.

Mr. L. Marquardt has described a new method for the quantitative determination of fusel-oil in brandy. The oil is extracted with chloroform, and the product is oxidized with bichromate of potash, distilled, and treated with barium carbonate. The chloroform and the excess of barium carbonate are removed, when the baryta and the barium chloride are determined by means of nitric acid. The quantity of amyl alcohol or fusel-oil is calculated from the baryta.

G. Larsen has shown that copper and zinc can be separated by one precipitation with hydrogen sulphide if hydrochloric acid is added to the hydrogen sulphide with which the precipitate is washed. Emil Berglund finds that the method holds good when the amount of hydrochloric acid added to the wash-water is smaller than recommended by Larsen, and further, that zinc is not precipitated with copper if the amount of hydrogen sulphide in the wash-water is small.

Spring has communicated the results of experiments in producing sulphides by exposing various metals mixed with sulphur, both finely divided, to a pressure of 6,500 atmospheres. Magnesium after six pressings, each time being reduced to filings, gave a gray homogeneous mass having a weak metallic luster. Zinc, after three pressings, gave a sulphide resembling the natural blende; iron, after four pressings, gave a block which was hardly touched by the file, and appeared homogeneous under the microscope. Cadmium sulphide was formed easily in three pressings, in a yellowish-gray, homogeneous mass. Bismuth sulphide and antimony sulphide were formed in two pressings, and lead sulphide still more easily; copper and tin yielded the sulphide in three pressings. Silver required from six to eight pressings before a homogeneous mass could be obtained. Aluminium and carbon gave imperfect results. Spring has drawn the conclusion from his experiments that allotropic states are only different conditions of polymerization, in which the chemical activity decreases as the process goes on.

The method almost exclusively employed for estimating the halogens in organic compounds, that of Carius, consists in heating the substance in a sealed tube with fuming nitric acid and silver nitrate. R. T. Plimpton and E. E. Graves propose, in the case of volatile compounds, a method by which the substance is introduced into a U-tube through which illuminating gas and air are passed, as in a Bunsen burner. The volatile substance evaporates and burns with

the gas at a tip on one end of the tube, while the halogens are left partly free and partly in combination with hydrogen. The evaporation is sometimes aided by warming the tube with hot water or otherwise. The temperature is raised or lowered so that the substance may always be detected in the flame, yet not in sufficient quantity to make the flame luminous. The products of combustion are aspirated through a bent funnel tube and collected in dilute caustic soda; this is boiled with sulphurous acid to reduce chlorates, etc., and the halogens are then precipitated with silver nitrate. The success of the experiment depends upon the regular volatilization of the compound.

Mr. W. G. Strype, of Wicklow, Ireland, has devised a method of purifying the hydrochloric acid used in the manufacture of chlorine from sulphuric acid before admitting it into the chlorine-stills, by which the difficulties arising in this manufacture from the accumulation of calcium sulphate are to a large extent obviated. His process depends upon the fact that while calcium sulphate is somewhat freely soluble in hot hydrochloric acid, it is only slightly soluble in the cold acid.

Successful experiments have been made by M. J. Garnier at works near Rouen, France, with a new process for removing arsenic and antimony from copper. It comprises the employment of a sole of chalk and tar, over which, for each separate operation, is placed a false sole of limestone and manganese peroxide. With the melting of the copper, a generation of carbonic acid and oxygen begins from the upper sole, which oxidizes the charge. As soon as the metal is sufficiently liquid, the lime and manganese protoxide rise and dissolve the arsenic acid. By this one operation the amount of arsenic, according to M. Garnier, is reduced to one-fifth. Subsequent fusions with basic fluxes are said almost completely to eliminate the arsenic.

Dr. Sidersky bases a method for the separation of calcium from strontium on the statement that on adding a mixture of sulphate and oxalate of ammonium to a solution of strontium, the latter is all precipitated as sulphate; while, if the mixture is added to a calcium salt, only oxalate is precipitated. If it is added to a solution containing both strontium and calcium, the former is precipitated as sulphate and the latter as oxalate. The two precipitates are separated by the solubility of the oxalate in acids.

Otto F. von der Pfordten has published a new method for the estimation of tungstic acid by reduction with zinc and hydrochloric acid to tungsten dioxide. The reduction is best effected by using a 27-per-cent. solution of hydrochloric acid. The solution first becomes blue, then a black-green, and finally a dark brownish-red, the end product being tungsten dioxide, which is determined by titration with potassium permanganate. The method has the disadvantage that only very small quantities of

tungstic acid can be used in the reduction, so that the percentage of error may easily become large.

Industrial Chemistry.—The manufacture of organic coloring-matters from coal-tar has made enormous progress within recent years, but the activity of chemists has been exerted to a much higher degree in developing the application of the direct products of tar-distillation than in bettering the methods of obtaining those products. Several of the coal-tar hydrocarbons have found extensive practical applications in the manufacture of the azo colors. The azo compounds, containing the group— $N=N$ —in combination with two aromatic nuclei, are all colored, but the azo hydrocarbons themselves have no affinity for animal and vegetable fibers, and hence can not be used as dyes. On the other hand, such of their derivatives as contain amido or hydroxyl groups are coloring matters. Some of these have long been known, but, with the exception of aniline yellow and Bismarck-brown, the azo compounds were not made use of until 1876. Since then, a great number of new ones have been made, many of which have been patented and manufactured on a large scale. The oxyazo colors are made from a diazo salt and the combination of a phenol with an alkali metal. The amidoazo colors are made on a large scale by the action of nitrous acid on a free amine, or, when this is not practicable, by the action of a diazo salt on an amine. By means of these reactions the number of azo colors which may be formed from aromatic compounds containing amido and hydroxyl groups is almost infinite. The popularity of these colors has become so great that the demand for the hydrocarbons used in making them has vastly increased, and their price has risen considerably, while attention has been given to means of producing them in greater abundance and in the state of purity in which they have to be to secure perfect colors.

The manufacture of soda by the ammonia process has been greatly increased within a few years past. Tables of the relative amounts of soda manufactured in different countries by the Leblanc and the ammonia processes, prepared by Mr. Walter Weldon, show that out of a total of 708,725 tons, representing the annual products of Great Britain, France, Germany, Austria, Belgium, and the United States, 163,225 tons are manufactured by the ammonia process and 545,500 tons by the Leblanc process. A new enterprise has been begun for the working of the Leblanc process in connection with the extraction of copper and iron from Spanish and Portuguese pyrites, in which the sulphuric acid evolved in that manufacture will be made economically available. The Rio Tinto Company is building factories in France for the exploitation of a combined process in which copper and oxide of iron will be relied upon as the products of chief importance, while soda and hydrochloric acid will be made as

by-products. Thus, at first soda was the only product of the Leblanc process that had commercial importance; then in time a demand grew up for chlorine, and the hydrochloric acid formed during the process became valuable; next, soda ceased to be profitable, and became a kind of by-product that continued to be made because chlorine could not be made without it. Now Leblanc soda, says Mr. Weldon, gives no profit at all, and chlorine none to speak of; and both have come to be regarded as secondary products, to be made only incidentally, and only because making them is essential to the application to certain ores of the wet method of extracting copper. The difficulty of obtaining a supply of ammonia commensurate with the extension of the demand, which it was at one time thought would hinder the speedy development of the ammonia process for making soda, has been removed—so completely that, notwithstanding the great increase in the development of the process, the price of ammonia is falling. It is now obtained commercially from coke-ovens; and Mr. William Ferrie has introduced with success a method for collecting it from the gases of blast-furnaces in which raw coal is used. From two of the sixteen blast-furnaces at the Gartsherry Iron Works in Scotland, ammonia and tar are now regularly collected at the rate of twenty pounds of ammonium sulphate per ton of coal consumed. Thus it appears to be possible to collect and utilize as ammonia a portion at least of the nitrogen of nearly all the fuel burned for industrial and domestic purposes. A suggestion has been made that the soda-maker shall entirely cease to use raw coal as fuel, but shall convert all his coal into coke, collecting for sale the oil and ammonia evolved during the conversion, and himself using for heating purposes the gases evolved during the coking operation and the coke itself. It is believed that the soda-maker might by this mode of proceeding obtain his fuel virtually for nothing. In the Leblanc process the chlorine of the salt decomposed is yielded as hydrochloric acid; in the ammonia process it is yielded as a somewhat dilute solution of calcium chloride. This is a matter of small importance in England, where hydrochloric acid is produced in excess; but on the Continent, where the demand for chlorine is greater than the supply, it operates against the Leblanc process. M. Solvay is accordingly about to try at his ammonia-soda works in Dombasle, France, a process for obtaining hydrochloric acid from calcium chloride. Having concentrated by evaporation the mixed solution of calcium and sodium chlorides which is the residual product of the ammonia process, he mixes it with clay into balls, dries the balls and heats them to redness in a current of steam, whereby he obtains a mixture of the vapor of water and the vapor of hydrochloric acid, which he dries by passing through a very strong solution of bichloride of calcium.

The Société de St. Croix at Lisle is manufacturing potash upon a large scale by the trimethylamine process, which is similar in principle to the ammonia process for the manufacture of soda. The latter process can not be used for the manufacture of potash, by reason of the too great solubility of hydro-potassic carbonate in solution of ammonium chloride. Bicarbonate of potash is, however, but very slightly soluble in chloride of trimethylamine. Besides the nature of the ammonia employed, the chemistry of this process appears to differ from that of the ammonia process also in the fact that, instead of using a bicarbonate as in that process, the sesquicarbonate, the highest carbonate of trimethylamine that can be obtained at present in a free state, is employed, and the reactions are more complex. The trimethylamine process is limited in its application, for it is available for the manufacture of potash only from potassium chloride, while the Engel process is efficient either with that salt or with the sulphate.

G. Archibald describes a new industrial method of preparing paper-pulp, which has been patented in the United States and Canada. Wood or straw is cut to pieces, macerated with milk of lime, transferred to a digester after twenty-four hours, and saturated with sulphurous acid, with the simultaneous application of a pressure of five atmospheres for one or two hours. The material is then washed with water and again treated under pressure with three per cent. calcium chloride and half per cent. aluminum sulphate. After these substances have been washed out, the pulp resembles cotton in appearance, and can be employed for manufacturing the finer grades of paper at once. The process requires about three hours after the treatment with milk of lime.

A. Houzeau and Fr. Goppelsroeder have traced the active agency in grass-bleaching, which Schoenbein ascribed to ozone, to peroxide of hydrogen. The proportion of this substance in the air was found to differ, according to a variety of circumstances; and the preponderating influence in its production is believed to be light. Atmospheric precipitations, particularly hoar-frost, contain considerable quantities of it; and the quantity that came to the earth within four months was found to amount to 62.9 milligrammes per square metre. The ordinary processes of open-air and wax-bleaching are attended with so many inconveniences in delays that the production of the effective agent in a concentrated form was suggested as a manifest remedy. The peroxide of hydrogen is superior to all other media for oxidation in bleaching, in that it can be used without inconvenience and without any danger of injuring the fiber. It may be concentrated from its solutions by freezing out, or by evaporation in a vacuum over sulphuric acid, at a temperature of from 52° to 68° Fahr. Diluted solutions of it are equal to solution of chlorine in effect, and will keep for months in a temperature not exceed-

ing 77° Fahr., if protected from the light. All products which are to be bleached by this substance must be submitted to a preparatory treatment, the purpose of which is to render them capable in every part of being moistened with the watery solution.

Dr. Max Schaffner and Mr. W. Helbig, of the Aussig Works, Bohemia, have applied a process for recovering sulphur from alkali-waste, which, while it requires no acid, saves the whole of the sulphur originally contained in the waste, and in addition all of the calcium as carbonate. It includes three operations, the first of which consists in heating fresh waste with solution of magnesium chloride in a closed iron vessel furnished with a mechanical agitator, when two double decompositions take place—calcium sulphide and magnesium chloride into calcium chloride and magnesium sulphide; and a reaction of the last upon some of the water present to produce magnesia and sulphureted hydrogen. The sulphureted hydrogen is evolved in a continuous stream until the charge of waste is completely decomposed, and then there remains in the boiler a solution of calcium chloride holding in suspension an equivalent of magnesia. In the second operation, one third of the sulphureted hydrogen is burned into SO₂, and steam, and these products are mixed with the other two thirds and passed through a solution of calcium chloride, whence is derived a thin magma, consisting of solution of calcium chloride holding in suspension free sulphur. The third operation consists in injecting carbonic dioxide into the solution of calcium chloride, holding magnesia in suspension, which had been obtained as the residual product of the first operation, thereby reproducing the quantity of magnesium chloride which had been begun with, and at the same time regenerating all the calcium carbonate which had been employed for the production of the black ash, of which the waste had been one of the constituents. Mr. Alexander Chance, of Birmingham, has applied a modification of the third part of the process, by which all of the sulphureted hydrogen evolved in the first operation is burned, and the resulting sulphurous oxide is sent into the vitriol chambers, by which the cost of the process is reduced simply to the cost of the operation of reducing the magnesium chloride.

MM. Benker and Lasne have introduced a process for economizing nitrous compounds in the manufacture of sulphuric acid, which consists in the reduction of the nitric peroxide in the chamber gases before they reach the Gay-Lussac tower into nitrous anhydride (N₂O₂), which forms a stable compound with sulphuric acid. This is done by injecting into the conduit conveying the exit gases from the last chamber to the foot of the Gay-Lussac tower, a regulated quantity of sulphurous oxide, accompanied with just the quantity of vapor of water necessary to form, with the SO₂ + NO₂, nitro-sulphuric acid. Another plan for accom-

plishing the same object consists in making the gases which have traversed the ordinary Gay-Lussac tower afterward traverse several supplementary towers, supplied with weaker sulphuric acid than is supplied to the Gay-Lussac tower itself.

Domestic Chemistry.—F. P. Hall, of the Massachusetts Institute of Technology, has published in the "American Chemical Journal" the results of some investigations on the corrosion of fruit-cans and tin-foil by the acids of the articles of food inclosed in them. Acetic, tartaric, and citric acids dissolved more tin and lead (in some cases twice as much) from sheets of pure metal than from alloys. In glass-stoppered bottles from which the air was as well excluded as it is from ordinary fruit-cans, the action was less than in loosely-covered beakers, but still considerable. Three cans that had been emptied were let stand two weeks with acid in them, at the end of which time the tinning had been taken off up as far as the acid reached. There was dissolved by

	Tin.		Lead.	
	Grammes.	Grains.	Grammes.	Grains.
Acetic acid.....	0.4178	0.0117	0.0878	0.1550
Tartaric acid.....	1.0480	0.0878		
Citric acid.....	0.6828	0.1550		

Hence a can once opened should be emptied immediately, as corrosion thereafter takes place very rapidly. Analyses of the "bright plate" of which cans and other tinware are made, showed no admixture of lead in the tinning, and no tinware could be found made of "terne plate," the sort that is understood to be coated with an alloy of tin and lead. The solder of the cans, however, contains a large amount of lead, and vegetable acids act on this as well as on the pure tin of the plate.

Twelve specimens of tin-foil obtained from dealers were analyzed. Only three of these were sold for pure tin, and they proved to be as represented; the others, some of which were called "composition foil," gave from 60 to 95 per cent. of lead. Nine specimens that had been in use gave various results. Two from different kinds of compressed yeast contained no lead, and a piece of foil from a cake of chocolate bought at a street stand was also pure. A piece of embossed foil from a fancy cake of chocolate gave 80 per cent. of lead, and in two specimens from Neufchâtel cheese were found respectively 73.19 and 75.27 per cent. "The use of a foil containing about 75 per cent. of lead for wrapping the so-called Neufchâtel and other soft cheese is certainly reprehensible. Owing to the acid in or developed in the cheese, the foil becomes crumbly, and even when the cheese is first covered with greased paper, particles of the oxidized foil are very likely to become attached to the cheese as it is used."

Mr. William Thomson, F. R. S. E., having investigated a case of lead-poisoning arising

from the use of unsuspected water-pipes of lead, was induced to examine the merits of the tin-lined pipes. A pipe, the coating of which was from $\frac{1}{8}$ to $\frac{3}{8}$ of an inch thick, to his surprise, gave evidence of contamination to the water that passed through, and the lining was found to contain a large proportion of lead. A similar pipe from another manufactory revealed the same impurity. These pipes were found to have been made by pouring tin down the side of a strip of lead in introducing it as lining. In the course of the process the tin had dissolved a considerable quantity of lead. Such pipes are used to a considerable extent in drawing beer, and are in danger of contaminating the liquor, particularly that portion of it which, standing in them over night, is sold to the first customer in the morning. In another kind of lead pipe, called "tinned-lead pipe," the inside coating is made by filling the first few inches of the lead pipe, while still very hot, with molten tin, which remains molten and washes the inner surface of the lead tube as it is produced. The quantity of this "tin" increases as the pipe is drawn out, by melting the lead with which it is in contact and carrying it along, and ultimately the lining consists chiefly of lead. Mr. Thomson has observed that aerated waters are contaminated with lead much more often and in many cases to a much greater extent than would be expected, considering the pains which is taken in preparing the articles. Manufacturers admit the fact, but say that it is impossible to procure the substances free from metallic contamination at anything like reasonable cost.

M. Gustave Le Bon has been carrying on investigations upon the action of antiseptics, from which he concludes that the disinfectant power of any antiseptic appears to be the more feeble as the putrefaction is the more advanced. If an aqueous solution containing one tenth its weight of minced meat be taken as the normal solution, it will exhale during the first stages of putrefaction an extremely fetid odor, which, however, can be destroyed by a comparatively small amount of antiseptic. At the end of about two months new bodies with a special odor will be developed, which require for their destruction quantities of the same antiseptic at least twice as great as at first. If the power of antiseptics be measured by taking as a means of comparison their disinfectant properties upon a given weight of the normal solution already mentioned, the most powerful disinfectants will be shown to be potassium permanganate, chloride of lime, sulphate of iron acidulated with acetic acid, phenol, and the glyceroborates of sodium and potassium. There is no parallelism between the disinfectant action of an antiseptic and its action on microbes. Potassium permanganate, which is one of the most powerful disinfectants, exercises no appreciable action on microbes. Alcohol, which checks the develop-

ment of microbes, exerts only a very feeble disinfectant action upon the products of putrefaction. There is likewise no parallelism between the power of preventing putrefaction and that of checking it when it has begun. Phenol and alcohol are excellent preservative agents, but have only a slight action upon putrefaction in progress; with the exception of a very few substances which are powerful toxic agents, such as mercuric chloride, the greater number of antiseptics, and notably phenol, have only a very feeble action upon bacteria. M. Le Bon even regards phenol as one of the best liquids which can be employed to preserve living bacteria for a long time. The experiments made upon cadaver alkaloids can not serve to decide the question as to whether the volatile alkaloids which give to putrefaction its odor are poisonous, for such experiments have generally been made by introducing into the system putrefaction products containing bacteria, to which the effects observed may be attributable. M. Le Bon's experiments were made upon frogs placed in jars, at the bottom of which was a very thin layer of his normal liquid. At the beginning of the putrefaction the liquid, although it emitted a very fetid odor, swarmed with bacteria, and was very virulent if injected under the skin, had no appreciable effect upon the frogs; but the same liquid, two months old and no longer having virulent properties, killed in a few minutes the animals that breathed its exhalations. In fact, the virulent power of a body in putrefaction and the toxic power of the volatile compounds which it gives off seem to be in an inverse ratio to each other. The extremely minute quantity of the products of advanced putrefaction necessary to kill an animal by simple mixture with the air it breathes is a fact that shows these volatile alkaloids to be extremely poisonous.

Atomic Weights.—Nilson has calculated the atomic weight of thorium from the sulphate, which he obtained from Arendal thorite by successive treatment with hydrochloric and sulphuric acids. The purified salt was twice precipitated with ammonia, and washed and dissolved in hydrochloric acid, and then converted into an oxalate and ignited. The snow-white oxide was converted into sulphate, and this was allowed to crystallize by the spontaneous evaporation of its solution. Large, transparent, brilliant crystals were thus obtained, which were permanent in the air and had the composition $\text{Th}(\text{SO}_4)_2(\text{H}_2\text{O})$. For the estimation of the atomic weight a weighed quantity of the pulverized salt was heated to expel its crystal water, again weighed, and then again heated to a full white heat. The sulphuric oxide was entirely expelled, leaving the pure thorium oxide, which was again weighed. From the data thus obtained the atomic weight was calculated. Assuming the quadrivalence of thorium, the means of two series of observations are, respectively, 232.43 and 232.37.

Oleve, taking the mean of twelve experiments upon the synthesis of yttrium sulphate with pure material, proved to be free from terbia, has redetermined the atomic weight of yttrium to be 88.9 ± 0.27 , or, if $\text{SO}_2 = 80$, then $\text{Yt} = 89.02$. The last figure suggests a fairly close conformity with Prout's law.

Clemens Zimmermann has prepared uranium by reducing a mixture of potassium or sodium with chloride of uranium, by heating in a charcoal crucible. Thus prepared, its atomic weight has been calculated to be 240, or greater than that of any other known metal. Uranium has the color and luster of silver, but is harder, and gives out sparks when struck with a hammer. It oxidizes gradually when exposed to the air, burns when heated on platinum-foil, and is dissolved by nitric acid. Its specific gravity has been determined at 18.7.

Analytic Chemistry.—The properties of hydrogen dioxide as an oxidizing agent have been found useful in a variety of analyses. It oxidizes arsenious acid to arsenic acid, and phosphorous acid to phosphoric acid, and decomposes hydrogen sulphide with the formation of water and free sulphur. If, however, it acts in ammoniacal solution, such as ammonium sulphide or sodium sulphide, the liquid becomes warm, and is gradually decolorized without deposition of sulphur; but that substance is instead oxidized to sulphates and hypsulphates. With sulphide of tin, antimony and arsenic in ammonium sulphide, the addition of hydrogen dioxide causes oxidation of the ammonium sulphide, with at first precipitation of the other sulphides, ending, on the addition of an excess of the reagent and heating, in their more or less complete transformation into oxides. The conduct of hydrogen dioxide toward ammonium sulphide, or the action of hydrogen sulphide gas on ammoniacal hydrogen dioxide, may be employed in qualitative analysis for destroying an excess of those sulphides, and in quantitative analysis for determining amounts of gaseous or dissolved hydrogen sulphide, or for the determination of sulphur or metals in sulphides. The property of oxidizing hydrogen sulphide easily and completely in alkaline solution may be taken advantage of in the estimation of chlorine, bromine, and iodine in liquids containing hydrogen sulphide. Metallic sulphides which are oxidized directly by hydrogen dioxide may be estimated by the amount of sulphuric acid formed in the solution. Such metals are arsenic, antimony, zinc, copper, and cobalt. The estimation of metals by this means is capable of more extended application than the direct oxidation of the sulphide. Pure metallic sulphides are seldom obtained in analysis, but more frequently mixtures with free sulphur. The amount of free sulphur does not affect the quantity of hydrogen sulphide liberated by an acid, and hence the advantage of determining the latter. It is absorbed in a peculiar apparatus, described by the authors. Foremost among the metals that

may be conveniently determined in this way, are antimony, tin, cadmium, and iron.

A question has arisen in the examination of the various processes for the analysis of water, whether a loss of volatile organic matter may not occur during the evaporation and boiling which are necessary, particularly in the ammonia process. Mr. Charles W. Marsh has made experiments to determine this question, to which attention was more strongly directed, while the investigations were going on, by the observation by Prof. Ira Remsen of such a loss in his analysis of the Farn-pond water of Boston. Out of twenty-six analyses which he performed for this purpose by the Wanklyn process, the sum of the free and the albuminoid ammonias was equal to the "total ammonia" in only four. In one of the four the sum apparently exceeded the "total," betraying probably a slight error in the estimation. These results prove that something in the water escapes conversion into ammonia. To determine whether this was something that escaped condensation, or something that would be found in the distillate, ten other analyses were made, the distillates of which were redistilled with permanganate and nesslerized. It appeared in eight of the last analyses that the excess of ammonia obtained where the whole of the water was distilled with the permanganate directly, over the sum of the free and albuminoid ammonia as usually obtained, was due to some volatile, condensable, nitrogenous compound, from which as much ammonia could be obtained by the action of boiling permanganate after its distillation from the original water as before. A modification of the usual ammonia process is suggested by these experiments.

MM. Ed. Heckel and Fr. Schlagdenhauffen have made analyses of the kola-nut (*Stercularia acuminata*), and found that it is richer in caffeine than the most esteemed coffees, and that this base is all included in a free state, and not combined, as in coffee, with an organic acid; that it contains a very appreciable quantity of theobromine, which operates to augment the action of the caffeine; that a notable quantity of glucose, of which cacao exhibits no trace, is present; that the quantity of amidon is triple what it is in the seeds of theobroma; that fatty matter is much less abundant than in cacao; and that a specific tannin and a red coloring-matter are present.

The difficulties which have hitherto prevented the isolation of levulose in a satisfactory state of purity have been overcome by Messrs. Jungfleisch and Lefranc, who have succeeded in preparing the pure substance in crystalline form, and have studied its properties. Thus crystallized, it consists of fine, colorless, silky needles, which sometimes attain the length of ten millimetres, and usually radiate from a central point, forming spherical groups. When freed from mother-liquor and dried over sulphuric acid, their composition is represented by the formula $C_6H_{12}O_6$. When moistened with

alcohol and exposed to the air, levulose is deliquescent, but when perfectly dry it is very slightly hygroscopic. It fuses at about 95° , and at 100° loses water gradually, yielding ether derivatives. Its rotary power varies very rapidly with the temperature, and varies in a still greater degree with the dilution of the solution.

Mr. Clifford Richardson, of the United States Department of Agriculture, has made a series of analyses of grasses of the United States, for the purpose of determining the relations of cultivated and wild grasses to each other, and the variations in composition which one species may present when grown on different soils and in different climates. His analyses embraced 77 of wild grasses, 21 of grasses from one farm in Pennsylvania, 19 of grasses from the grounds of the Department of Agriculture, and 6 of orchard-grass from various localities. Against the results he has placed, for comparison, the averages of those obtained by Wolff from the analyses of German grasses. The analyses plainly show that all our American grasses are strikingly different in composition from similar German varieties, chiefly in that the content of nitrogen is smaller, and the amount of fiber is diminished, while the amount of nitrogen free extract is larger, and the fat is slightly increased. The nutritive range in the American grasses is, then, much wider than in the German grasses. In the American grasses the wild varieties are of much less nutritive value than the cultivated sorts. The average composition of orchard-grass is not equal to that of the better-cultivated grasses, and the quality of the latter is improved as the cultivation is higher—a fact shown by the superior quality of the grasses grown in the highly-fertilized grounds of the department. The tables of the analyses also show that the amount of nitrogen in the non-albuminoid form is larger in the wild grasses than in the cultivated varieties, and that it varies somewhat inversely as the quality of the grass. In the analysis of a single species (orchard-grass), from different localities, it appeared that the amount of non-albuminoid nitrogen does not increase with an increase in the total amount of nitrogen in the grass, for the poorer species had more than twice as much, relatively to the total nitrogen, as the more cultivated ones; and the variations in the non-nitrogenous elements do not show any regularity dependent on climate and surroundings. Analyses of meadow fox-tail at four stages of growth showed that the total nitrogen diminishes regularly from early to late stages; that the albumen diminishes nearly in the same way, but remains constant for quite a long period at the time of blooming; and that the non-albuminoid nitrogenous substances, while decreasing rapidly from the first stage at which the grass was collected, to nothing at full bloom, increase again slightly after bloom. The fiber increases toward maturity, while the fat decreases. The substances making up the

"free-nitrogen extract" vary less regularly. Sugars appear in larger amount in the young plant than in the other stages. The same is the case with the organic acids.

Animal Chemistry.—Accompanying the formation of nitrogenous tissue in the vegetable organism, occurs a corresponding increase of phosphoric acid, and in the excretory products of the animal kingdom a definite quantity of nitrogen has been found to be accompanied by a relative amount of phosphoric acid. Again, when less nitrogen is excreted than is taken in the food, less phosphoric acid is also passed off, and from these data Kossel has inferred the existence of a compound of albuminous matter with phosphoric acid. The nucleins approach nearest to such a composition. Kossel has recently undertaken a quantitative determination of nuclein by estimating the nuclein-phosphoric acid.

His percentages of acid found in various tissues are always largest in the case of organs containing most cell-nuclei; thus, in the spleen of the ox was found .636 per cent. of nuclein-phosphoric acid, in the liver .890 per cent., and in the pancreas .580 per cent., while in ox-muscle was found only .092 per cent., and in human blood merely a trace. It has been suggested that the amount of nuclein might be determined from the quantity of its decomposition products, viz., guanine, xanthine, and hypoxanthine, but Kossel has found that the quantity of hypoxanthine, though in proportion to the quantity of nuclein in some organs, bears no such relation in the muscles; thus the muscle of the fowl yields much hypoxanthine, but has a very small content of nuclein. He also points out that the organs especially engaged in the nutritive and regenerative processes of the body contain far more phosphoric acid in the form of nuclein than the locomotor apparatus. Two so-called nucleins, those from cow's milk and the yolk of egg, which do not come from cell-nuclei, differ from those found in living tissue in yielding no xanthine, hypoxanthine, or guanine.

The exact chemical nature of the peptones has been much discussed, and no agreement of opinion has been reached upon it. In fact, the numerous results recorded are so strikingly at variance with each other that the theories on the subject have been, from time to time, very much modified. These differences may be partly accounted for by reference to the great diversity of conditions under which the experiments have been conducted. According to Herth's analysis, there is but little difference between albumen (Wurz's formula) and the peptone formed from it. From a great number of analyses of peptones prepared by fractional precipitation with alcohol and ether, Herth has drawn conclusions in favor of the individuality of the peptones, and infers that there is no ground for belief in the theory that they are a mixture of several closely-related bodies. Adamkiewicz concludes from his studies that chemically the

peptones are nothing but albuminates which differ from ordinary albumen by containing a diminished content of inorganic salts and a somewhat different molecular formation, but the grounds on which he bases his view are controverted by Maly and Herth, who found no evidences of a materially diminished quantity of salts; and Aronson has shown that the uncoagulability of the peptones—their most striking feature—is wholly independent of inorganic salts. Herth concludes that the analytical data give no idea of the actual alterations which albumen undergoes in its transformation into peptones, and thinks it possible that a rearrangement of the atoms takes place; but he has few supporters. Henninger believes, after a long investigation, with Wurz and Hoppe-Seyler, that the formation of peptones is due to a process of hydration. He has also attempted to produce albumen again from his peptones by a process of dehydration, and has succeeded in forming syntonin, the next modification of albumen. This result has been confirmed by Hoffmeister, who has, by dehydrating fibrine-peptone and dissolving the product in cold water, obtained a flocculent residue showing all the reactions of albumen. Maly holds that there is only one principal product of digestion, one peptone, which differs but slightly from the mother-substance in composition. Kossel inclines to the belief that more than one peptone can originate from a single albumen, and that these bodies which we now term peptones do not actually possess a chemical individuality. As regards the nature of peptone, whether it is an acid or a base, the preponderance of evidence is on the side of its being an acid, while it is capable of acting both as an acid and as a base. Henninger regards the peptones as feeble amido acids, and, as such, capable of acting either as acids or bases. The combination of peptones with acids is formed directly whenever an acid is added to a solution of peptone, and the compound is a salt of the peptone corresponding to the acid employed. Peptones also combine with salts, forming a very loose union.

R. H. Chittenden has given an account of an examination for arsenic of a human body disinterred for the purpose nearly six months after burial, in order to ascertain the actual amount of poison in the whole body, and at the same time to glean all possible facts relative to its distribution. The analysis was performed by oxidizing a weighed amount of the sampled organic matter with nitric and sulphuric acids at elevated temperatures, and ultimately obtaining the arsenic and weighing it in the metallic state, the results being verified when possible by duplicate analyses. From the amount of arsenic found in the portion examined, the content of the entire organ or portion of tissue was calculated. By this method, the internal organs were found to contain 1.1694 grain of arsenious oxide, and the rest of the body 1.9498, making a total of 3.1192

grains for the whole body. A striking feature of the results was the irregular distribution of the arsenic in the muscular tissue, which varied from nothing in the bone up to a quarter of a grain per pound in the muscle of the back, whereas, in cases of chronic poisoning, or where arsenic is habitually used, the distribution is generally quite regular. The irregularity is regarded as indicative of the arsenic having been taken but a short time before death, particularly as the larger proportions of poison in the muscular tissue were observed in the parts nearer to the great vessels and organs. It is usual in cases of chronic poisoning to find a considerable proportion of the poison in the kidneys. In the present case only a small proportion was found there, while the tongue and throat contained nearly three times as much, or nearly as much as was contained in the entire left arm. It has been asserted that the presence or absence of arsenic in the brain is an index as to whether the poison was introduced into the body before or after death. The finding of arsenic in the brain may be regarded as proof that its introduction was not *post mortem*, but its absence can not be held to prove the contrary. The amount of arsenic found in the brain in the present case can be regarded only as indicating that it was taken in a form readily soluble and diffusible.

Passive and Active Oxygen.—Moritz Traube has published a discussion of the circumstances under which oxygen experiences the remarkable change of passing from the ordinary passive to the active condition. Considering the formation of hydrogen dioxide under the influence of the slow oxidation of metals in the presence of water and air, he concludes, from such experiments as he has made, that the process is not one of the oxidation of water, but a reduction process, in which the dioxide is probably formed by the addition of hydrogen directly to oxygen. Oxygen, at the ordinary temperature, is characterized by great passivity, but in the animal body it becomes active, and has the power of effecting oxidations at temperatures below 40° C. (104° F.), which it can otherwise effect only at a red heat. Regarded from this stand-point, the adult animal, which neither loses nor gains in weight, plays the part of a catalytic body, which, without suffering material change in composition, causes at low temperatures, by means of the oxygen of the air, the almost complete combustion of enormous quantities of food. Plants also, or, in general, all organisms down to and including bacteria and fungi, possess the same property, though to a much less extent; and there does not exist an organism which is indifferent toward oxygen. Herr Traube further assumes that he has pointed out, "with conclusive reasons," that the real hearth of the respiratory processes in animals is not the blood, but the tissues of the body, above all, the muscles; that the oxygen taken up in the lungs is set free in the capillaries of the body, and enters as dis-

solved gas into the tissues of the individual organs; and that in this way each individual organ breathes independently at the expense of the free oxygen. Thus, not only do organisms as a whole have the power to make oxygen active, but each of their organs, indeed each individual cell; or, rather, they contain substances which have the power. Hence the problem of active oxygen is in the highest degree important, as well for physiology as for chemistry.

Constancy of the Amount of Carbonic Acid in the Air.—Very careful determinations of the proportion of carbonic acid in the atmosphere at different places have been made by M. J. Reiset, with a particular view to answering the questions: For a given place is there more or less carbonic acid in the air on a clear day than on a cloudy day? Is there a difference in the proportion between day and night, or between winter and summer? Is there more or less carbonic acid at the bottom of a mountain than at the top? Is there more or less in the air near the sea than in the inland country? etc. His tests were made by the precipitation of carbonate of baryta by passing a known volume of air through a solution of baryta. His investigations have led to the conclusions that the maxima in the proportion of carbonic acid always correspond to cloudy, foggy, or misty weather; that air collected in the night contains more carbonic acid than that collected during the day, and that the minima of the acid correspond to days of fine weather, with bright sunlight and absence of clouds. Investigations to ascertain the effect of vegetation on the proportion were made difficult by the rapid diffusion of the gas in the air, and the variations were hardly appreciable. They indicated, however, a diminution of the proportion over growing fields. The presence of a flock of three hundred sheep near the apparatus on a certain day of fine weather, caused a notable increase in the proportion of the acid. A number of analyses were made near the Parc Monceau in Paris. During the month of May, when fires began to be extinguished, the mean was found to be 30.57 per 100,000 of air. The maximum, 35.16, was obtained on the 27th of January, 1879, during the period of most active combustion; the minimum, 29.13, was obtained May 31, 1875. The normal variations in proportion are generally between 28 and 80 per 100,000 of air, and are more sudden and more numerous during the summer. Determinations made by M. M. Muntz and E. Aubin, in the city of Paris and in the open country near Vincennes, gave results substantially agreeing with those of M. Reiset, and indicate that carbonic acid is uniformly distributed throughout the lower strata of the atmosphere, while variations in the proportion occur only between very narrow limits, and are due to local influences. M. M. Muntz and Aubin also applied their analyses to the upper strata, fixing their station

on the summit of the Pic du Midi in the Pyrenees, 9,422 feet above the sea. Notwithstanding that during the course of the experiments the direction of the wind and the state of the atmosphere varied frequently, the proportion was found to be constant, and to give as the mean of a large number of observations 2.86 parts by volume of carbonic acid to 10,000 parts of air.

A New Form of Phosphorus.—Messrs. Ira Remsen and E. H. Keifer, by distilling phosphorus in an atmosphere of purified hydrogen and condensing the vapor on cold water, obtained a white phosphorus, differing very greatly in appearance from ordinary phosphorus, which floated on the water in a snow-white layer about a quarter of an inch in thickness, and which was changed to ordinary phosphorus very easily, as by putting it into warm water. The white phosphorus thus obtained is light and plastic. If placed on a piece of bibulous paper, so that the water is absorbed from it, it gives off dense white fumes and melts, but does not take fire, and is then nothing but ordinary phosphorus. It dissolves readily in carbon bisulphide, and melts at exactly the same point as ordinary phosphorus, when it is transformed into it. It thus seems to bear the same relation to ordinary phosphorus as flowers of sulphur to roll-brimstone. It is also much less susceptible to the influence of light than ordinary phosphorus. Böttger describes another white phosphorus, which, however, appears to be quite different from this.

CHILI (República de Chile). The area of portions of Patagonia and the Tierra del Fuego, acquired by the treaty made between Chili and the Argentine Republic, at Buenos Ayres, on July 23, 1881, is estimated at 215,725 square kilometres, which would increase the area of Chili to 537,187 kilometres, without counting the province of Tarapacá, ceded to Chili by Peru in the treaty of peace made at Ancón, signed Oct. 20, 1883, and containing the ensuing stipulations:

1. Peru cedes to Chili, forever and unconditionally, the department of Tarapacá to the Quebrada de Camarones.

2. The territories of Tacna and Arica will, for a term of ten years, remain subject to Chilian authority. At the close of this term the vote of the people is to be taken in those localities, and direct suffrage to decide whether the same are to return to Peru or remain Chilian. In either case, the country to which they will thenceforth be definitively annexed engages to pay to the other an indemnity of \$10,000,000.

3. Chili solemnly engages to carry out all the clauses in the treaty relating to the guano and nitrate-of-soda trade, and to pay over to the creditors of Peru 50 per cent. of the net proceeds accruing to the Chilian exchequer out of the working of these two products, until either the indebtedness is canceled or the deposits of said products are exhausted. Those

discovered henceforward on the territory annexed shall be the exclusive property of Chili. Beyond this, Chili is not responsible for any Peruvian indebtedness.

4. As regards the island of Lobos, Chili is to continue administering the same until the expiration of the contract having reference to the sale of 1,000,000 tons of guano. The island shall then revert to Peru. Finally, Chili engages to cede to Peru, upon ratification of this treaty of peace, the 50 per cent. due the latter out of the net proceeds of the Lobos island guano-sales. The treaty to be ratified, and the exchange of ratifications to be effected at Lima within one hundred and eighty days from date. Till then Chili is authorized to maintain in Peru an army of occupation, toward the maintenance of which Peru engages to pay the general-in-chief \$300,000 silver coin monthly.

A cable message, dated Lima, Jan. 8, 1884, stated that this monthly indemnity would be considerably modified in view of the financial condition of Peru.

A cable dispatch, dated Dec. 11, 1883, announced that the Bolivian commissioners had arrived at Santiago, Chili, and that forty-eight hours after their presentation a treaty of peace was signed between Chili and Bolivia. A brief sketch of the vicissitudes of the war in 1883, and its close, will be found under BOLIVIA.

On Jan. 1, 1882, the population of Chili was estimated at 2,223,434; a year later, at 2,289,180.

The capitals of the provinces were counted in 1882, and the number of inhabitants set against each is as follows: Santiago, 190,000; Valparaiso, 95,000; Talca, 19,000; Concepcion, 19,000; Chillom, 18,000; Canquenes, 13,000; Serena, 13,000; Copiapó, 12,000; San Felipe, 11,500; Curico, 11,000; Linares, 8,000; Angeles, 8,000; Lebu, 7,000; Ancon, 6,000; Valdivia, 6,000; Angal, 5,000; Puerto Montt, 4,000; and Punta Arenas, 1,000.

The President of the Republic is Señor Don Domingo Santa-Maria, inaugurated Sept. 18, 1881, for the usual term of five years.

The Cabinet was composed of the following ministers: Interior, Señor J. M. Balmaceda, in office since April 12, 1882; Foreign Affairs and Colonization, Señor L. Aldunate, since April 12, 1882; Justice, Public Worship, and Instruction, Señor J. E. Vergara, since Sept. 18, 1881; Finance, Señor P. L. Cuadra, since April 12, 1882; War and Navy, Señor C. Castellon, since Sept. 18, 1881.

The Chilian Envoy Extraordinary and Minister Plenipotentiary to the United States is Don Joaquin Godoy, accredited June 23, 1882; the Chilian consul at New York is Señor D. de Castro.

The United States Envoy Extraordinary and minister at Santiago is Dr. O. Logan, accredited in 1882; the United States consul at Valparaiso is Mr. Lucius P. Foote.

Army.—Don Benjamin Vicuña Mackenna introduced a bill into the Senate creating one general of division and two brigadier-generals, for

the reason that, prior to the war, on Sept. 12, 1878, the force of the army did not exceed 3,122 men, that during the war the army of occupation alone counted 25,000, and that during the summer of 1883 the Chilian army still numbered 17,408 men, while the number of generals was the same as in 1878 and in 1854, when the army counted only 3,000 men. The regular army comprised, in 1882, 9 generals, 19 colonels, 77 lieutenant-colonels, 114 majors, 198 captains, and 562 lieutenants, together 979 officers; ten battalions (9,040 men), three regiments (1,500 men) horse, and two regiments (2,214 men) artillery; total strength of army, 12,921. The National Guard counts 31,118 men enlisted, 17,912 of whom perform service.

Navy.—The navy, in 1883, embraced two iron-clad frigates, one monitor, two corvettes, two gunboats, and two cruisers, carrying, together, 58 guns, having a joint tonnage of 10,611, and 3,260 horse-power—the whole equipped by 1,728 sailors.

The navy furthermore comprises two steamers, one transport, five pontoons, five small steamers, and eleven torpedo-boats.

Navy officers: One vice-admiral, four counter-admirals, eleven captains of ships-of-the-line, fourteen captains of frigates, twenty-two of corvettes, forty lieutenants, and forty-two enrolled cadets.

Finance.—The President, in his annual message, remarked with reference to the depreciation of the paper money in circulation in Chili, and the low ruling of it as compared with the exchange on Europe, that this unfavorable feature must be due in part to the general trade relations between Chili and foreign countries, the outstanding amount of paper money being comparatively small.

The latest report of the Minister of Finance renders an account of the actual workings of the Treasury in 1882. According to this document, the ordinary revenue reached the aggregate of \$40,107,209, being an increase of \$3,672,488 over that of 1881. The extraordinary revenue amounted to \$1,849,825, thus increasing the income of the nation in 1882 to \$41,957,035. As, at the same time, the ordinary and extraordinary expenditure did not exceed \$41,620,187, there was an excess of receipts of \$306,897. The budget for 1884 estimates the income at \$44,365,000, and the outlay at \$46,586,550.

Foreign Debt.—On Dec. 31, 1882, the foreign debt of Chili amounted to \$34,878,000. The amount set aside toward the sinking fund for 1884 is \$1,567,000. These sinking-fund operations have at no time, according to what the minister states, been less than 2½ per cent. in a year, but in some years they reached 14½ per cent.

CHILIAN FOREIGN INDEBTEDNESS.

1870.....	\$27,849,000	1877.....	\$37,400,500
1871.....	27,079,500	1878.....	35,908,000
1872.....	24,232,000	1879.....	34,370,000
1873.....	24,815,500	1880.....	34,370,000
1874.....	25,689,000	1881.....	34,370,000
1875.....	30,183,000	1882.....	34,370,000
1876.....	35,809,000	1883.....	34,370,000

As nearly all the foreign loans have been contracted for railroad purposes, the minister appends to his report a statement of the actual value of the Government railroads on Dec. 31, 1882:

Line from Valparaiso to Santiago.....	\$17,378,930
" " Santiago to Curico.....	9,298,324
" " Curico to Angol.....	8,193,818
" " Chilian to Talcahuano.....	4,793,904
Total.....	\$40,171,846

The Minister of Finance has appointed a committee of investigation to report on existing mining laws, and a revision of the same. The committee is to give its opinion on the ensuing queries: Whether it is advisable to create a national mining bureau; if so, the committee is to suggest what sphere of action should be assigned to it, and where it should have its seat; whether the export duty on mineral products should be modified, and to what extent the import duty on mining material and sheet-iron, examining at the same time to what extent the public revenue would be affected by such changes; what new privileges may be safely extended to mining industry so as to foster its development; to what extent transportation should be increased and perfected between the mines and the coast. Finally, the committee is ordered to procure complete statistics bearing on every branch of mining industry in all its details. The minister feels confident that great results will be reached if this important branch of the public wealth receives the attention it deserves at the hands of the Government and people of Chili, and for this purpose the bureau is proposed to be created.

Another committee has been appointed to lay down the basis for a revision of the tariff, the members of the committee being merchants of leading nationalities.

National Legislation.—A bill was passed to secularize the cemeteries, which caused a great deal of commotion among orthodox Catholics, especially the female portion thereof, and at Santiago the ladies personally petitioned the President *en masse* to intercede in behalf of threatened faith while the bill was under debate. Other bills elicited almost as much interest among the public at large, among them one reforming public instruction, another legalizing civil marriage, one granting certain privileges to parties building a dry-dock at Valparaiso, one creating the new province of O'Higgins in the department of Rancagua, one ordering a special medal to be struck to reward the soldiers participating in the crowning victory of the war, the battle of Huamachuco, of July 10, 1883; finally, a pension bill in favor of all soldiers who fought on the Chilian side in the late war.

On the other hand, the Senate rejected the bill limiting the coastwise trade to the Chilian flag.

Railroads.—In 1882 the total length of government lines was 949 kilometres (equal to 598

miles), and of private lines 906 kilometres (equal to 571 miles); together, 1,855 kilometres, or 1,169 miles.

Postal Service.—The number of post-offices, in 1882, was 370, forwarding during the year altogether 10,204,097 letters, 19,950 sample packages, 13,786 legal documents, 493,572 government dispatches, and 11,046,534 newspapers; together, 21,777,939 items of mail matter, the gross amount of postage collected being \$378,749.

Telegraphs.—The telegraphic service was, in 1882, carried on in 186 offices, 127 of which were under government management; the total length of lines was 9,498 kilometres (equal to 5,981 miles), of which 8,943 kilometres were government lines. The number of messages sent was 433,475; of these 159,999 were government dispatches, and 273,476 private. The gross amount collected for telegrams was \$378,749.

Immigration.—To hasten the settlement of Villa-Rica, the new city founded in the center of the Indian territory of Araucania, now being civilized, the Government has made a contract with Don Francisco de B. Echeverria for the introduction from Europe of 2,000 families from the Basque provinces of Spain. Meanwhile the agent of Ohilian colonization in Europe has contracted for the immigration into Ohili of numerous families belonging to the farming class in Germany.

College Reforms.—The Minister of Public Instruction is elaborating a reform project for the School of Arts and Trades at Santiago, preference to be given to the more practical branches of education in that college, and for this purpose, professors and machinists of note are, if possible, to be engaged abroad, and machinery, etc., is to be procured for practical demonstration.

Trade-Marks in Chili.—Ohili provides for the protection of trade-marks both to residents and foreigners. The registry of the marks is inscribed on the register of the office of the National Society of Agriculture. The Ohilian definition of a trade-mark is somewhat vague, and is comprised under the two heads, trade-marks applied to articles as products of industry, and marks applied to objects of traffic, the one relative to marks indicating ownership, as concerns the manufacturer, and the other that of distinctive ownership on the part of the dealer. The registry must be renewed every ten years.

New Pass over the Andes.—The recent discovery of a pass across the mountain-chain which divides Chili from the Argentine Republic may possibly exert an important influence upon the future of South America. This pathway has long been known to the Indians of the mountain-region, but they have hitherto kept it a secret. For more than 1,000 miles the Andes extend between Ohilian and Argentine territory, at an average elevation of 13,000 feet above sea-level. When the dispute in regard

to the possession of Patagonia, a few years ago, threatened to bring the two republics to blows, it was seen that any war between them must be fought out at sea, the passage of the Andes, by any openings then known, being impossible against a hostile force. An Argentine army, to maintain itself at all, would have needed to emerge from the mountains upon Ohilian soil somewhere near its objective point—that is to say, Valparaiso and Santiago, which are comparatively near each other, and would be included in any plan of invasion. The practicable passes thus became limited to the Patos and the Cumbre, for those farther north would not only give an invading army a dangerously long line of communication with its base, but are too difficult of ascent, and in some cases are approached over barren regions. The only pass to be seriously thought of, in fact, was La Cumbre, which is almost opposite Valparaiso, or on the same parallel; and yet its height, its extreme narrowness for many miles, its continued windings and abrupt ascents, would make it defensible by 1,000 good men against an invading army from either side.

But the newly discovered Bariloche Pass, being near Lake Nahuelhaspi, puts an entirely new face on the question of transandean communication. It is situated where the continent, narrowing greatly, forms the peninsula of Patagonia; it is approached easily across the pampas, and from the westernmost Argentine post at Nahuelhaspi the distance is only a few score miles to the Pacific coast.

The commercial importance of this pass, however, far outweighs all military considerations. The two enterprising republics have removed their only serious source of dissension by a peaceful division of Patagonia, and henceforth the one can pursue its development as an Atlantic and the other as a Pacific country. Both have long sought railroad communication across the Andes. One such road, in fact, has already been undertaken between Buenos Ayres and Santiago, designed to pierce the mountains by way of Mendoza, through one of the passes already spoken of. The extreme difficulties of this route have impeded its construction; but a road starting from the Gulf of San Matias and crossing northern Patagonia through the Bariloche Pass would have only half the length of the more northerly route, and would traverse a region where the peculiar relations of the mountains to the two oceans cause the storms to be usually of rain rather than snow, the route being in about 42° S. lat., and hence in a temperate climate. The great drawback seems to be that it traverses a region infested with hostile Indians.

Of course, a most important consideration is the exact height of the new pass; but since it is known that the Andes in Patagonia fall off to an average altitude little more than half that of a few miles farther north, the route seems certain to yield advantages in this particular.

Agriculture.—M. A. F. de Fontpertuis writes about the economical condition and agricultural and mineral resources of Chili, in an article published in the "Economiste Français": Out of the 2,200,000 inhabitants more than two thirds are agriculturists; and the eight central provinces, Santiago, Colchagua, Curicó, Talca, Maule, Lináres, Nuble, and Concepcion, alone contain a farming population of 1,400,000 souls. While the country between Valparaiso and Santiago resembles the plains of northern Italy, the resemblance is merely superficial, for even in its best portions the soil of Chili is poor; immense plains are uncultivated, and the methods of culture are most primitive, being in this respect the very reverse of those in use in northern Italy. In both countries there is a lack of rainfall, and they have to resort to irrigation. The destruction of forests has been such in Chili that in some regions on the coast there are during a year 835 days of drought, 12 days of a light and 18 days of a heavy rainfall. The plain of Chili, it is true, is traversed by numerous water-courses, such as the Rio-Bio, Chillan, Maule, Nuble, and many more, receiving their water from the snow of the Andes, but their fertilizing action is limited to a restricted area, and the art of irrigation is only properly understood in the more northern provinces, Talca and Curicó. Out of 84,245,500 hectares of land only 7,891,200 are arable, and of these only one seventh is under culture, and even in this portion cultivation is to a notable extent slothful. Democratic economists in Chili attribute this state of affairs to the large land-holdings by descendants of the conquerors, and insist, not without some reason, that these large "hacendados" or landed proprietors have been a calamity for Chilian agriculture. Fortunately, some time ago the law of primogeniture was abolished, and since then landed property gets to be gradually better distributed among the farming population. This change has also had the good effect of causing many of the large proprietors to settle down on their lands and cultivate them, instead of living in luxury at the capital. Yet there have been till now comparatively few small prosperous farmers, and the system of long leases has not even yet been introduced.

Mining.—Copper is found in a great many localities, especially in the provinces of Coquimbo, Aconcagua, Santiago, Nuranto, Chiloe, and in Atacama, although in the latter two gold and silver predominate. Caldera is the chief port of the last-named province. Copiapó, its capital, is in the center of a long, narrow valley, which might be fertile if it were not so badly irrigated, and surrounded by many silver-mines partially abandoned because exhausted. The richest mines were formerly the Charnacillo, turning out, during the comparatively short period of 47 years from 1832 to 1879, no less than \$240,000,000 worth of pure silver, but these are now nearly exhausted.

They have been worked to a depth of 1,800 to 2,200 feet. The amalgamating of silver-ores is carried on in great establishments at and near Copiapó.

Nitrate.—The belief prevailed for a long time that the province of Tarapacá was the only portion of the Atacama desert producing nitrate enough to make it worth while exporting the same, but the high taxes imposed by Peru caused explorers to prospect the southern portion of the desert in Bolivia and in the northern part of Chili. In this manner the nitrate deposits at Antofagasta were discovered, and a great impulse was given to the nitrate industry there; but the rivalries arising led to the late war.

Commerce.—Chilian foreign commerce nearly doubled during the four years following 1878:

	Total foreign trade.	Increase.	Increase per cent.
1878	\$63,999,075		
1879	65,416,184	\$1,487,109	2.32
1880	67,192,718	21,779,784	33.20
1881	106,878,168	21,682,245	34.56
1882	124,573,940	15,995,177	14.69

IMPORT.

	1882.	1881.
By sea	\$51,441,872	\$45,903,888
Overland	2,060,842	1,770,048
Total	\$53,502,714	\$46,973,931

EXPORT.

	1882.	1881.
Products of the mines	\$58,187,670	\$47,145,787
Products of agriculture	11,638,418	9,967,780
Sundry merchandise	818,088	870,894
Re-export	997,674	1,458,661
Goods "in transitu"	1,092,779	1,878,378
Specie and bullion	1,194,507	1,582,277
Total	\$71,874,126	\$61,904,289

Chilian custom-houses yielded in 1882 the ensuing amounts of revenue:

Import duties collected	\$11,502,500
Ten per cent additional	689,848
Export duties	609,608
Wharf-dues	182,208
Light-house and tonnage dues	71,997
Seizures and fines	4,581
Difference in exchange collected	1,493,845
Export duty on nitrate of soda	7,192,385
Total	\$22,896,272

THIRTY-EIGHT YEARS OF CHILIAN FOREIGN TRADE.

	Average annual import and export.	Per capita of the population.	Increase per cent.
1844-1858, 10 years ..	\$21,000,000	\$19

1874-1881, 8 " ..	73,000,000	35	28

Anglo-German Competition.—A French merchant reports from Iquique under date of May 15, 1883: "Although French goods are generally very much liked in Chili, the trade between France and this coast has notably declined dur-

ing the past twenty years, while Anglo-German merchants, more active than French, have succeeded in substituting their manufactures for ours. But this is not the only success which English and German merchants can boast of: with abundant means and good European banking connections at their disposal, they have boldly gone into the nitrate industry and exportation, so that the bulk of this article now goes to Liverpool and Hamburg. Nor is this due to any very great superiority of theirs in the way of steamship lines, for we have our fine Havre line of steamers regularly touching at all ports on the west coast. The causes for this decay of French trade in this direction lie deeper, and we have to search for them in France, where both merchants and manufacturers trouble themselves too little about the changes going on in these distant countries on the Pacific, and, instead of establishing branch houses or agencies in them, and thus pushing the export trade to them, they cling to time-worn methods, and are thus ousted from connections once valuable."

EXPORT OF NITRATE OF SODA DURING THE FIRST TEN MONTHS.

Total.....	9,481,673	8,469,856	5,588,819

Chilian Trade with England, France, and the United States.—The import from Chili into the United States in 1881 was \$1,435,970 worth of goods against \$13,288,071 from Chili into England, and \$5,478,793 into France, while the export from the United States to Chili was \$1,614,386, from England \$13,075,526, and from France \$6,364,464. In 1882 the import from Chili into the United States was \$1,810,487, and the export from the latter to the former \$1,774,645 worth of goods.

During the fiscal year ended June 30, 1883, the United States imported from Chili only \$435,584 worth of goods, specie, and bullion, and exported thither \$2,837,551 worth of domestic goods and \$22,945 foreign ditto. This shows an extraordinary increase of domestic exportation from the United States to that country in a single twelvemonth.

During the fiscal year ended June 30, 1882, the United States imported from Chili 67,018,386 pounds of nitrate of soda, and 2,584,219 pounds of wool, and exported thither of domestic goods 5,259,858 yards of cotton goods; \$304,335 worth of machinery and hardware; 1,188,700 gallons of petroleum; 567,560 pounds of lard; 873,585 pounds of refined sugar, and \$263,687 worth of lumber and wooden-ware, besides numerous other articles.

Merchant Marine.—There were sailing under

the Chilian flag, in 1883, 181 sea-going vessels, of a total tonnage of 53,070, comprising 27 steamers, which aggregated 12,512 tons.

CHINA, an empire in Asia, officially called Chung Kwoh ("The Middle Kingdom"). The Government is organized on patriarchal principles laid down in the books of Confucius and other ancient sacred writings. The supreme power is vested in the Emperor. There are two high advisory bodies which guide the policy of the Emperor. One is the Neko, or Inner Council, consisting of four members and two assistants, who see that the enactments are in harmony with the laws of the sacred books. Two of the active members and one of the juristic assistants must be chosen from the Manchu, and the other half of the Council from the Chinese race. Under the supervision of the Neko are the six boards of government, which have charge respectively of the civil service, finance, ceremonies, the army, justice, and public works. The practical direction of affairs has passed into the charge of a body called the Council of State (Ohun-chi-chu), which is free from the rigid constitution and procedure of the Neko. The same men are often found in both councils, and also serving in some of the six ministries or other high charges of state. Besides the six ministries, there is a board of censors, whose duty it is to investigate all the departments of state and review the acts of government; a ministry for the administration of the dependent states; the military administration of Peking, which also superintends the police service; and an office for the administration of foreign affairs. The eighteen provinces have each a governor, who in the case of most of them is subordinated to a governor-general placed over two or three provinces.

The Emperor is Kwangsu, the ninth ruler of the Tartar dynasty which conquered China in 1644. The law of succession prescribes that each Emperor shall appoint his successor from among the sons of the princes of the royal house. Kwangsu was not regularly appointed, the late Emperor having died suddenly, but was by the management of the Empress dowager and his father, Prince Kung, proclaimed Emperor, Jan. 22, 1875, in the fourth year of his age.

The members of the Council of State are Prince Kung, Pao Yun, Li-hung-tesao, Ching-lien, and Weng-tung-ho. The Prince Kung is president of the ministry for foreign affairs.

Area and Population.—The total area of the eighteen provinces is 1,584,953 square miles, and the total population, as given in the latest official returns, 362,447,183, being 236 per square mile. The density of population in the province of Kiangsu is as great as 850 per square mile; in Anhwei, 705; in Chekiang, 671; in Pecheli, the capital province, 475; in Shantung, 444. The least thickly inhabited provinces are Szechuen, with 128 inhabitants per square mile, Kwangsi with 98, Kwei-

chow with 82, Yunnan with 51, and the great province of Shenking with only 10 persons to the square mile.

The dependencies of China, not including Corea, which is practically independent in its internal and external affairs, subject to a suzerain control that is kept almost entirely in abeyance, have an estimated area and population as follow :

DEPENDENCIES.	Square miles.	Population.
Manchuria.....	892,818	12,000,000
Mongolia.....	1,288,085	2,000,000
Thibet.....	648,784	6,000,000
Jungaria.....	152,958	600,000
East Turkestan.....	481,800	580,000
Total.....	2,878,885	21,180,000

The greater part of the Ili, or Kulja, territory in Jungaria was receded to China by the treaty concluded with Russia, Feb. 24, 1881, but 4,840 square miles were annexed to Russia, which received also 8,120 square miles on the Black Irtysh.

The population of Peking, the capital, is estimated variously at from 500,000 to 1,650,000. Several cities in the interior are supposed to contain over 1,000,000 inhabitants. The estimated population of the treaty ports is as follows: Canton, 1,600,000; Tientsin, 950,000; Foochow, 680,000; Hangchow, 600,000; Shanghai, 850,000; Ningpo, 260,000; Takao and Taiwan, 235,000; Nanking, 150,000; Ohinkiang, 135,000; Amoy, 95,600; Tamsui, 90,000; Wenchow, 88,000; Kelung, 70,000; Niuchwang, 60,000; Wuhu, 60,000; Kiukiang, 58,000; Chefoo, 35,000; Iohang, 34,000; Swatow, 30,000; Kiungchow, 30,000; Pakhoi, 25,000.

The number of foreigners residing in the treaty ports in 1882 was reported as 4,894, of whom 2,402 were English, 474 Germans, 472 Japanese, 410 Americans, 335 French, 202 Spaniards, and 599 of other nationalities.

Commerce and Agriculture.—The annual value of the foreign commerce for the past six years was as follows, in taels (1 Haikwan tael = \$1.50):

YEAR.	Imports.	Exports.
1877.....	78,288,896	67,445,022
1878.....	70,504,027	67,173,179
1879.....	82,227,424	72,261,262
1880.....	79,228,452	77,883,587
1881.....	91,910,877	71,452,274
1882.....	77,715,228	67,826,646

The imports in 1882 from Great Britain, Hong-Kong, East India and other British possessions amounted to 67,640,000 taels; the exports to Great Britain and British dependencies to 40,801,000 taels; the imports from the United States to 3,277,000 taels, as against 3,300,000 in 1881; the exports to the United States to 8,420,000 taels, as against 10,222,000; the imports from Continental countries, not including Russia, to 2,484,000 taels; the exports to Continental Europe to 8,752,000 taels; the ex-

ports to Russia by ship to Odessa, 946,000 taels, overland *via* Kiachta, 8,286,000 taels; imports from Japan, 4,442,000 taels; exports to Japan, 1,787,000 taels; imports from and exports to other countries, 1,644,000 and 3,865,000 taels respectively. The main part of the import trade is through Shanghai, which does also the largest export trade, Canton coming next, and after it Foochow and Hangchow.

The following table gives an analysis of the foreign trade of 1881 and 1882, showing the values imported and exported of the different classes of merchandise, in taels:

IMPORTS.	1881.	1882.
Opium.....	87,590,000	26,746,000
Cotton goods.....	26,046,000	22,707,000
Woolen goods.....	5,584,000	4,494,000
Metals, and manufactures of.....	4,829,000	4,701,000
All other.....	17,590,000	19,065,000
Total.....	91,911,000	77,715,000

EXPORTS.	1881.	1882.
Black tea.....	26,201,000	25,878,000
Green tea.....	6,107,000	4,091,000
Brick tea.....	1,468,000	1,204,000
Silk and manufactures.....	26,588,000	22,587,000
Sugar.....	2,574,000	3,012,000
All other.....	9,225,000	10,124,000
Total.....	71,458,000	67,827,000

Chinese trade has suffered for a year or two from various causes. In 1882, in consequence of excessive speculation in joint-stock enterprises, occurred a financial crisis. Interest rose at times in 1882 to 30 and 35 per cent. Many failures happened in consequence. The imports of gray and white shirtings were less by a million pieces than in 1881, and prices were 10 per cent. lower. Opium imports fell off 9,000 chests. The reformatory efforts of the Chinese Government and the use of the Szechuen product have nearly expelled the Indian drug from northern China. The quantity imported at the northern ports was but little more than a third as much as in 1879. The yield of silk has fallen off to an alarming extent. The cause is supposed to be the ravages of a disease of the silk-worm similar to that which prevails in Europe. The falling off was considerable in 1882; but in 1883 the quantity fit for export was not more than half as much as in average years. The cultivation of the sugar-cane is extending in southern China in the country back of Amoy, Swatow, and Canton, and on the island of Hainan and the southern part of Formosa. The exports of sugar go mostly to Australia and Japan. In certain districts along the East river as much as 40 per cent. of the area is planted to sugar, exciting the anxiety of conservative native economists, who see the more necessary rice-culture neglected for the more profitable new product.

In 1882, notwithstanding the general depression in trade, there was a further development of the tendency which first showed itself a year or two before, on the part of Chinese

native merchants and capitalists, to invest in enterprises carried on by foreign companies. Companies were started with native capital, under purely native management, for the working of coal, copper, and other mines. The numerous projects started in this speculative period include also gold and silver mining, and paper, glass, and cotton manufactories. Chinese capital was invested even in remote enterprises carried on by foreigners in Perak, North Borneo, Selangor, and Colorado, and much of it was consequently lost.

Navigation.—The movement of shipping in Chinese ports is shown in the following table, which gives the number and tonnage of the vessels arriving and of those sailing under each flag, added together:

FLAG.	1881.		1882.	
	Vessels.	Tons.	Vessels.	Tons.
British	18,416	10,882,249	14,387	10,814,779
German	1,682	728,027	1,964	859,856
American	870	224,730	762	167,801
French	103	185,784	192	172,281
Japanese	237	185,892	250	194,534
Chinese	6,297	4,767,158	6,429	4,775,969
Other	642	264,464	695	330,432
Total	28,187	16,640,278	24,729	17,338,269

Of the total number of ships entered and cleared in 1882, 19,607, of an aggregate tonnage of 16,102,574, were steamers, against 18,170, of 15,350,954 tons, in 1881.

Communications.—The only railroad in 1882 was one eight miles long, running to the Kaiping coal-mines. Besides short local lines, there was completed in 1881 a telegraph line from Tientsin to Shanghai, 950 miles. A line from Shanghai to Canton was under construction in 1883.

Finance.—The accounts of the Imperial Government are not made public. The approximate yield of the various sources of revenue is estimated as follows:

SOURCES OF REVENUE	Taels.
Land-tax	13,000,000
Land-tax paid in kind	18,100,000
Likin (new impost on merchandise)	20,000,000
Customs under Administration of Progress	12,000,000
Customs under native administration	8,000,000
Salt	5,000,000
Sale of titles of rank	7,000,000
Other sources	1,400,000
Total	79,500,000

In 1882 the European custom-house administration collected import duties to the amount of 4,684,007 taels; export duties, 8,068,435 taels; pilotage, 740,078 taels; tonnage dues, 279,799 taels; transit toll, 313,353 taels—total, 14,085,672 taels.

The Chinese Government raised a foreign loan of 13,500,000 taels in 1874. Of this 7,000,000 taels have been repaid. There are domestic debts amounting to 30,000,000 taels.

Army and Navy.—The army has been divided since the Manchu conquest into the Banner army and the Green Flag militia. The former, recruited from an hereditary military class,

and constituting the garrison with which the Tartar conquerors long held the country in unwilling subjugation, is the most efficient branch, and may be considered as the regular army of China. Much attention has been paid in recent years to the improvement of its organization, training, and equipment. First American and French, and subsequently British military men, have been its instructors in tactics. The Bannermen are divided into three branches, one recruited from the descendants of the Manchu army, one from their Mongol and one from their Chinese allies who helped conquer China. The Manchus are the most numerous, and are the subjects of the greatest care, as the majority of the officers and of the Board of War belong to this race. Their efficient force is 87,800 men, that of the Chinese or Hankiun Bannermen 27,000, and that of the Mongols, 21,100—making altogether 115,900 men. Of these, about one half are stationed in the Pecheli province, and the rest distributed through the empire to form the Tartar garrisons in the chief cities. The war strength of the Banner army can be largely augmented, since there were five times the present numbers on the rolls thirty years ago. The Chinese Government has further fighting material at its disposal in the frontier tribes and the Mongols of Mongolia, who alone can be levied on for 200,000 men, one third of them mounted. The national militia, or Green Flag troops, have formerly been discouraged by the military caste, and are still kept in a state of military inefficiency through the not groundless fears of the Peking Government of the danger of the dynasty from a powerful national army. For many years Li Hung Chang has devoted great pains to the training of the Tartar force in the capital province by European tacticians. About 70,000 troops have thus been made capable of rapid military movements. The number of troops in the empire who are trained in the European way, and armed with modern weapons, is between 100,000 and 200,000. The forts which guard the approaches to the capital are defended by a large number of Krupp and Armstrong guns.

The Chinese Government some time ago acquired several European naval vessels, and has recently been at great expense to secure others of a more perfect type, which are being constructed at Kiel. In 1880 the fleet contained two frigates, a corvette, and 47 gunboats, with transports and smaller craft—the total armament consisting of 283 guns.

Political Situation.—The diplomatic dispute with France regarding the suzerainty of China over Annam absorbed the attention of the ruling powers in China in 1883 (see *TONKIN*). Li Hung Chang, the liberal minister, who has had much to do with guiding the foreign policy of China for several years past, was recalled by the Empress Regent from the three years' seclusion into which he had just entered to mourn the loss of his mother, according to the

national custom. After the failure of the negotiations of M. Tricou at Shanghai, the direction of the Tonquin business passed out of the hands of Li and the peace party into those of Prince Kung and the anti-foreign court party, who opposed a bolder and more resolute resistance to the demands of France.

Canton Riots.—In September serious anti-European riots broke out in Canton. The Chinese are accustomed to see crimes punished with extreme severity, while the foreign consuls are loath to enforce rigorously the laws of their own countries when dealing in the exercise of extra-territorial jurisdiction with acts of violence committed upon Chinamen by Europeans. The populace of Canton were already excited to a dangerous pitch by the news of the French repulses in Tonquin and the warlike attitude of the Peking Government, when two flagrant instances of shielding Europeans from justice wrought them into fury. An Englishman, an official in the Chinese custom-house, fired a gun into a crowd of Chinese who were making a disturbance, killing one native and wounding two others. The Chinese were excited over a rumor that this man, whose name was Logan, was being screened, and, as in many previous similar cases, would escape the consequences of his crime. A day or two later a Portuguese sailor from a British ship killed a Chinaman. In this case the consul refused to arrest. When the embittered people saw the vessel depart with the homicide on board, September 10th, they pushed in a great crowd to the foreign quarter and attacked stores and houses. The merchants armed themselves with rifles, and fired a volley into the crowd, killing five and wounding many others. This rendered the mob more desperate, and they plundered and set fire to fourteen warehouses, English, German, French, and American, and four dwellings, and only ceased upon the arrival of the Chinese troops. Tumultuous crowds gathered the next day, but committed no further acts of violence. The foreign residents had fled on board vessels in the harbor. After the arrival of two British, one French, and five Chinese gunboats, they returned to their homes. The Chinese authorities thereafter preserved order in Canton, but the irritation continued. The condemnation of Logan to seven years' imprisonment for manslaughter was to the minds of the Chinese equivalent to his escape.

Floods.—China suffered in 1888 from inundations which caused great suffering and loss of life. The Yellow river burst through the embankments and overflowed the lower country over hundreds of square miles. The country surrounding Tientsin and lying between that city and the capital was also flooded by the overflow of the rivers. The Government made considerable grants of rice to the homeless and starving peasantry, and encouraged private donations by offers of brevet rank. A scheme for the improvement of the protective works

on the Yellow river has been adopted by the Government. The execution of a more thorough system of stream regulation for the Yellow river in accordance with the principles of modern engineering would avoid for the future the periodical disasters in this country which have occurred since early times.

CHRISTIANITY, Growth of.—On the day of Pentecost, the number of converts to Christianity was 3,000. At the end of the first century the number had reached 800,000. In the year 323, when the Emperor Constantine was converted and began to encourage Christianity and suppress heathenism, the number of Christians was 10,000,000; at the latter part of the sixth century, 20,000,000; at the close of the eighth century, 30,000,000. During the next two centuries the growth was 20,000,000, making 50,000,000 at the close of the tenth century. Then from the close of the tenth to the close of the eleventh century the gain was 20,000,000, making the number, at that date, 70,000,000. The next hundred years witnessed a growth of 10,000,000. Thus, for about thirteen hundred years there had been a steady gain, and the number now reached 80,000,000. But during the next century there was a decline of 5,000,000; then followed, for the same period, a similar gain, making the number at the close of the fourteenth century the same as at the close of the twelfth, viz., 80,000,000. In the days of Luther the number reached 100,000,000. Thus, from the tenth to the fifteenth centuries the number of Christians had doubled. At the close of the eighteenth century the number had again doubled, i. e., became 200,000,000. From 1800 to 1880 the number again doubled, reaching 400,000,000. Hence we see that the last three periods in which Christianity doubled were 500 years, 300 years, and 80 years, respectively. These figures include all nominal Christians, comprising the Greek, the Roman Catholic, and the Protestant churches. From 1800 to 1880 it is estimated that the Greek Church gained 25 per cent., the Roman Catholic Church 80 per cent., and the Protestant 170 per cent.

In 1792 William Carey originated the modern foreign missionary movement. He became a great Oriental scholar, and lived to see the Bible, in whole or in part, spread among the people of India in forty dialects. He aroused an active missionary spirit among the English Baptists, and his dictionaries, grammars, and other works, in the Bengalee, Sanskrit, and other tongues of India, not only prepared the way for the rapid spread of the gospel, but also brought him distinguished honor from the British Government. Since the days of Carey, Christianity has advanced in India, China, Japan, Africa, and in other fields, with remarkable rapidity. The number of Christ's followers at this date (1888) is, without doubt, 450,000,000. The converts in foreign fields are now numbered by hundreds of thousands, and are gaining rapidly every year. In 1880 there

were only 50,000 Christians in heathen lands; now there are more than 2,000,000. In 1830 the Bible was read in 50 languages and dialects; now in 250, and 150,000,000 Bibles are in circulation. In 1818 Judson arrived in Burmah, and in 1819 he baptized the first convert. In that province to-day there are 25,000 communicants, and about 76,000 adherents to the faith. In 1850 there were in India about 14,000 communicants, and 91,000 nominal Christians. To-day there are 114,000 communicants and about 420,000 nominal Christians. In the province of Madras, ten years ago, the number of Christian adherents was 161,000; to-day the number is 300,000. And throughout India, China, Africa, and other lands, the gospel is spreading at a rate never equaled since the days of the apostles. According to Gibbon, imperial Rome, at the time of her greatest extent, ruled about 120,000,000 people; but to-day Christian nations govern 650,000,000.

While the progress of Christianity has been very marked throughout the whole world, in the United States, where it has had an open field and perfect freedom, its gain has been greater than in any other land. During the past eighty-three years—and particularly during the past three decades—the growth has been more rapid than in any former period. Eighty years ago students in Yale and Harvard Colleges were accustomed to call themselves by the names of French and German infidels. In Yale College, infidel students used to combat President Dwight with their views in the classroom. Only a very small portion of the students in the colleges of the country at that time were church-members. In 1745 there were only four church-members among the students of Yale. But a wonderful change has taken place in that college since.

From 1870 to 1880 Harvard graduated over 1,400 young men, and only two of the number registered themselves as "skeptics." In 1830 26 per cent. of the students of New England colleges were church-members. In 1880, out of 12,063 students in sixty-five colleges in the United States, 50 per cent. were professors of religion. In 1800, the population of the United States was about 5,000,000, and the number of communicants in the various churches was 364,000, averaging one to fifteen of the population. In 1880, with a population of 50,000,000, the number of communicants was over 10,000,000, averaging one to five of the population. These numbers include the communicants in Protestant churches alone. In 1800 there was about one clergyman to every 2,000 of the population. In 1880 there were 69,870 ordained ministers in the Evangelical churches of the United States, averaging one to every 720 of the population.

From 1850 to 1880 the increase of the Roman Catholic population (not enrolled communicants) was 4,753,000. During the same period the increase in the number of communicants in the Protestant churches was 6,500,000.

In 1850, in Boston, Mass., and vicinity, within a radius of ten miles, there were 19,888 communicants in the Baptist, Congregational, and Methodist churches combined. In 1880 the membership of those churches had increased to 45,752, being a gain of 230 per cent.

From the year-books of the principal denominations in the United States we gather the following general summary for 1883:

DENOMINATIONS.	Ministers.	Church-members.
Adventists.....	107	11,100
Adventists, Second.....	501	68,500
Adventists, Seventh-Day.....	167	17,189

† Roman Catholic population.

CIVIL RIGHTS. In 1875 Congress passed an act to secure civil rights to colored citizens. It became a law March 1st of that year. On October 15, 1883, certain of its sections were declared unconstitutional by the United States Supreme Court.

The law was entitled "An act to protect all citizens in their civil and legal rights." Its preamble recited that "it is essential to just

government that we recognize the equality of all men before the law, and hold that it is the duty of Government in its dealings with the people to mete out equal and exact justice to all, of whatever nativity, race, color, or persuasion, religious or political; and it being the appropriate object of legislation to enact great fundamental principles into law, therefore be it enacted," etc. The first sections of the act are as follows:

SECTION 1. That all persons within the jurisdiction of the United States shall be entitled to the full and equal enjoyment of the accommodations, advantages, facilities, and privileges of inns, public conveyances on land or water, theatres, and other places of public amusement; subject only to the conditions and limitations established by law, and applicable alike to citizens of every race and color, regardless of any previous condition of servitude.

SEC. 2. That any person who shall violate the foregoing section by denying to any citizen, except for reasons by law applicable to citizens of every race and color, and regardless of any previous condition of servitude, the full enjoyment of any of the accommodations, advantages, facilities, or privileges in said section enumerated, or by aiding or inciting such denial, shall for every such offense forfeit and pay the sum of five hundred dollars to the person aggrieved thereby, to be recovered in an action of debt, with full costs; and shall also, for every such offense, be deemed guilty of a misdemeanor, and, upon conviction thereof, shall be fined not less than five hundred nor more than one thousand dollars, or shall be imprisoned not less than thirty days nor more than one year:

Provided, That all persons may elect to sue for the penalty aforesaid, or to proceed under their rights at common law and by State statutes; and having so elected to proceed in the one mode or the other, their right to proceed in the other jurisdiction shall be barred. But this provision shall not apply to criminal proceedings, either under this act or the criminal law of any State:

And provided further, That a judgment for the penalty in favor of the party aggrieved, or a judgment upon an indictment, shall be a bar to either prosecution respectively.

These sections were held unconstitutional so far as they apply to the States. The Territories and the District of Columbia are subject to the complete legislative control of Congress. Whether the act of 1875 is valid as applied to cases arising in the Territories and the District of Columbia, is a question which the Court said was not before it, and which therefore it refused to decide. There is room for question whether the act of 1875 being unconstitutional in part—that is, as to the States—will stand as constitutional in part—that is, as to the Territories and the District of Columbia. But there is no doubt of the constitutional power of Congress to enact a civil-rights law applicable alone to the Territories and the District of Columbia. The Court further remarked that whether Congress in the exercise of its power to regulate commerce among the States might or might not enact a law governing civil rights in public conveyances—by land and water—passing from one State to another, was also a question not before it, and it is one on which the Court expressed no opinion. It is believed, however, that Congress has such power.

The third section of the act of 1875 relates to procedure in cases arising under sections 1 and 2. It falls with those sections. Section 4 is as follows:

That no citizen possessing all other qualifications which are or may be prescribed by law shall be disqualified for service as grand or petit juror in any court of the United States, or of any State, on account of race, color, or previous condition of servitude; and any officer or other person charged with any duty in the selection or summoning of jurors who shall exclude or fail to summon any citizen for the cause aforesaid shall, on conviction thereof, be deemed guilty of a misdemeanor, and be fined not more than five thousand dollars.

This section is held constitutional by the Supreme Court on grounds which will be explained farther on.

The constitutionality of the first two sections was tested in five cases brought from the Federal circuit courts in different parts of the country. In two of these cases the accommodations of a hotel had been denied to negroes in Kansas and Missouri on account of their color; in two, admission to seats in the dress-circle of a San Francisco theatre and to seats in a New York theatre had been refused to colored persons; and one was a suit brought in Tennessee against the Memphis and Charleston Railway Company for not permitting a colored woman to ride in a car set apart for white persons. As all of these cases involved the same constitutional question, these were considered together in one opinion by the United States Supreme Court.

It is conceded that before the adoption of the thirteenth amendment to the Federal Constitution Congress had no power to pass a civil-rights law such as that of 1875. If it exists at all, the authority must be derived from the thirteenth amendment or the first or the last section of the fourteenth amendment. This is the thirteenth amendment:

SECTION 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or in any place subject to their jurisdiction.

SEC. 2. Congress shall have power to enforce this article by appropriate legislation.

The first and last sections of the fourteenth amendment are:

SECTION 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

SEC. 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

Considering these two amendments in their inverse order, the Court holds that the fourteenth prohibits State but not individual action against the civil rights of colored citizens, and that it empowers Congress to protect these

rights when denied or abridged by a State, but not when invaded by individuals. As the act of 1876 was intended to punish persons for violating the civil rights of colored citizens, when these rights were not denied by the State, its enactment was held to be an exercise of power not given to Congress by the fourteenth amendment. The meaning of this amendment and the reasons on which the Court based its decision are set forth in the following extracts from the opinion prepared by Justice Bradley:

The first section of the fourteenth amendment (which is the one relied on), after declaring who shall be citizens of the United States, and of the several States, is prohibitory in its character, and prohibitory upon the States. It declares that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws." It is State action of a particular character that is prohibited. Individual invasion of individual rights is not the subject-matter of the amendment. It has a deeper and broader scope. It nullifies and makes void all State legislation and State action of every kind which impairs the privileges and immunities of citizens of the United States, or which injures them in life, liberty, or property without due process of law, or which denies to any of them the equal protection of the laws. It not only does this, but, in order that the national will, thus declared, may not be a mere *brutum fulmen*, the last section of the amendment invests Congress with power to enforce it by appropriate legislation. To enforce what? To enforce the prohibition. To adopt appropriate legislation for correcting the effects of such prohibited State laws and State acts, and thus to render them effectually null, void, and innocuous. This is the legislative power conferred upon Congress, and this is the whole of it. It does not invest Congress with power to legislate upon subjects which are within the domain of State legislation; but to provide modes of relief against State legislation, or State action, of the kind referred to. It does not authorize Congress to create a code of municipal law for the regulation of private rights; but to provide modes of redress against the operation of State laws, and the action of State officers, executive or judicial, when these are subversive of the fundamental rights specified in the amendment. Positive rights and privileges are undoubtedly secured by the fourteenth amendment; but they are secured by way of prohibition against State laws and State proceedings affecting those rights and privileges, and by power given to Congress to legislate for the purpose of carrying such prohibition into effect; and such legislation must necessarily be predicated upon such supposed State laws or State proceedings, and be directed to the correction of their operation and effect. A quite full discussion of this aspect of the amendment may be found in *U. S. vs. Cruikshank*, 92 U. S. Reports, 543; *Virginia vs. Rives*, 100 Id., 313, and *Ex-parte Virginia*, 100 Id., 339. . . .

Until some State law has been passed, or some State action through its officers or agents has been taken, adverse to the rights of citizens sought to be protected by the fourteenth amendment, no legislation of the United States under such amendment, nor any proceeding under such legislation, can be called into activity: for the prohibitions of the amendment are against State laws and acts done under State authority. Of course, legislation may, and should be, provided in advance to meet the exigency when it arises; but it should be adapted to the mischief and wrong which the amendment was intended to provide against; and that is, State laws, or State action of some kind, ad-

verse to the rights of the citizen secured by the amendment. Such legislation can not properly cover the whole domain of rights appertaining to life, liberty, and property, defining them and providing for their vindication. That would be to establish a code of municipal law regulative of all private rights between man and man in society. It would be to make Congress take the place of the State Legislatures and to supersede them. . . .

An inspection of the law shows that it makes no reference whatever to any supposed or apprehended violation of the fourteenth amendment on the part of the States. It is not predicated on any such view. It proceeds *ex directo* to declare that certain acts committed by individuals shall be deemed offenses, and shall be prosecuted and punished by proceedings in the courts of the United States. It does not profess to be corrective of any constitutional wrong committed by the States; it does not make its operation to depend upon any such wrong committed. It applies equally to cases arising in States which have the justest laws respecting the personal rights of citizens, and whose authorities are ever ready to enforce such laws, as to those which arise in States that may have violated the prohibition of the amendment. In other words, it steps into the domain of local jurisprudence, and lays down rules for the conduct of individuals in society toward each other, and imposes sanctions for the enforcement of those rules, without referring in any manner to any supposed action of the State or its authorities.

If this legislation is appropriate for enforcing the prohibitions of the amendment, it is difficult to see where it is to stop. Why may not Congress with equal show of authority enact a code of laws for the enforcement and vindication of all rights of life, liberty, and property? If it is supposed that the States may deprive persons of life, liberty, and property without due process of law (and the amendment itself does suppose this), why should not Congress proceed at once to prescribe due process of law for the protection of every one of these fundamental rights, in every possible case, as well as to prescribe equal privileges in inns, public conveyances, and theatres? . . .

Civil rights, such as are guaranteed by the Constitution against State aggression, can not be impaired by the wrongful acts of individuals, unsupported by State authority in the shape of laws, customs, or judicial or executive proceedings. The wrongful act of an individual, unsupported by any such authority, is simply a private wrong, or a crime of that individual; an invasion of the rights of the injured party, it is true, whether they affect his person, his property, or his reputation; but if not sanctioned in some way by the State, or not done under State authority, his rights remain in full force, and may presumably be vindicated by resort to the laws of the State for redress. . . .

If the principles of interpretation which we have laid down are correct, as we deem them to be (and they are in accord with the principles laid down in the cases before referred to, as well as in the recent case of *United States vs. Harris*, decided at the last term of this court), it is clear that the law in question can not be sustained by any grant of legislative power made to Congress by the fourteenth amendment. That amendment prohibits the States from denying to any person the equal protection of the laws, and declares that Congress shall have power to enforce, by appropriate legislation, the provisions of the amendment. The law in question, without any reference to adverse State legislation on the subject, declares that all persons shall be entitled to equal accommodations and privileges of inns, public conveyances, and places of public amusement, and imposes a penalty upon any individual who shall deny to any citizen such equal accommodations and privileges. This is not corrective legislation; it is primary and direct; it takes immediate and absolute possession of the subject of the right of admission to inns, public conveyances, and places of amusement. It supersedes and displaces State

legislation on the same subject, or only allows it permissive force. It ignores such legislation, and assumes that the matter is one that belongs to the domain of national regulation.

We have discussed the question presented by the law on the assumption that a right to enjoy equal accommodations and privileges in all inns, public conveyances, and places of public amusement, is one of the essential rights of the citizen which no State can abridge or interfere with. Whether it is such a right or not, is a different question, which, in the view we have taken of the validity of the law on the ground already stated, it is not necessary to examine.

The Court then took up the thirteenth amendment, which abolishes slavery. Even admitting that this clothed Congress with power to pass laws necessary and proper for abolishing all badges and incidents of slavery, it could not be held, the Court said, that denying to colored persons equal accommodations and privileges of hotels, public conveyances, and places of amusement, imposed upon them any badge of slavery or servitude. "Such an act of refusal," says the opinion, "has nothing to do with slavery or involuntary servitude, and if it is violative of any right of the party, his redress is to be sought under the laws of the State; or if those laws are adverse to his rights and do not protect him, his remedy will be found in the corrective legislation which Congress has adopted, or may adopt, for counteracting the effect of State laws, or State action, prohibited by the fourteenth amendment. It would be running the slavery argument into the ground to make it apply to every act of discrimination which a person may see fit to make as to the guests he will entertain, or as to the people he will take into his coach or cab or car, or admit to his concert or theatre, or deal with in other matters of intercourse or business. Innkeepers and public carriers, by the laws of all the States, so far as we are aware, are bound, to the extent of their facilities, to furnish proper accommodation to all unobjectionable persons who in good faith apply for them. If the laws themselves make any unjust discrimination, amenable to the prohibitions of the fourteenth amendment, Congress has full power to afford a remedy under that amendment and in accordance with it."

The grounds for setting aside the first two sections of the act of 1875, under the fourteenth amendment, do not apply to the fourth section, and this was conceded to be constitutional, as had been expressly held in the Virginia jury cases. The section prohibits any discrimination on account of color in the summoning or selection of jurors. Such discrimination, the Court points out, can be made only by law, for which the State is responsible. It can not be made by individuals without the authority of State laws. It may be made by statute, or, in the absence of any statutory disqualification on account of color, colored jurors may be excluded by a judge or some other officer of the law. In either case the discrimination is effected by the agency of the State.

Eight of the nine justices concurred in the judgment of the Court. An elaborate dissenting opinion was rendered by Justice Harlan, of Kentucky, who maintained that the thirteenth as well as the fourteenth amendment conferred upon Congress the power which was exercised in passing the civil-rights act of 1875. "The opinion in these cases," he remarked, "proceeds, as it seems to me, upon grounds entirely too narrow and artificial. The substance and spirit of the recent amendments of the Constitution have been sacrificed by a subtle and ingenious verbal criticism." He then pointed out that in the *Dred Scott* case the Supreme Court had held that negroes were not a part of the people of the United States; that they were not entitled to the privileges and immunities of citizens; that, in the language of Chief-Justice Taney, "they had no rights which the white man was bound to respect." He cited an earlier case—*Prigg vs. Pennsylvania*—to show that the Court, in upholding the constitutionality of the fugitive slave law, had conceded to Congress a power which was not expressly granted by the Constitution, but was derived from it by implication. The purpose of the thirteenth amendment, he said, was to abolish slavery with all its badges and incidents, and to establish universal freedom. There was a fixed purpose to place beyond doubt the power of Congress to legislate in furtherance of these ends. The power to enforce the provisions of the amendment was therefore expressly granted, and not left to implication. He said:

The thirteenth amendment, my brethren concede, did something more than to prohibit slavery as an institution, resting upon distinctions of race, and upheld by positive law. They admit that it established and decreed universal *civil freedom* throughout the United States. But did that freedom, thus established, involve nothing more than exemption from actual slavery? Was nothing more intended than to forbid one man from owning another as property? Was it the purpose of the nation simply to destroy the institution, and then remit the race, theretofore held in bondage, to the several States for such protection, in their civil rights, necessarily growing out of freedom, as those States, in their discretion, choose to provide? Were the States, against whose solemn protest the institution was destroyed, to be left perfectly free, so far as national interference was concerned, to make or allow discriminations against that race, as such, in the enjoyment of those fundamental rights that inhere in a state of freedom? Had the thirteenth amendment stopped with the sweeping declaration, in its first section, against the existence of slavery and involuntary servitude, except for crime, Congress would have had the power, by implication, according to the doctrines of *Prigg vs. Commonwealth of Pennsylvania*, repeated in *Strader vs. West Virginia*, to protect the freedom thus established, and consequently to secure the enjoyment of such civil rights as were fundamental in freedom. But that it can exert its authority to that extent is now made clear, and was intended to be made clear, by the express grant of power contained in the second section of that amendment.

That there are burdens and disabilities which constitute badges of slavery and servitude, and that the express power delegated to Congress to enforce, by appropriate legislation, the thirteenth amendment,

may be exerted by legislation of a direct and primary character, for the eradication not simply of the institution, but of its badges and incidents, are propositions which ought to be deemed indisputable. They lie at the very foundation of the Civil-Rights Act of 1866.

"I do not contend," continued Justice Harlan, "that the thirteenth amendment invests Congress with authority, by legislation, to regulate the entire body of the civil rights which citizens enjoy, or may enjoy, in the several States. But I do hold that since slavery, as the Court has repeatedly declared, was the moving or principal cause of the adoption of that amendment, and since that institution rested wholly upon the inferiority, as a race, of those held in bondage, their freedom necessarily involved immunity from, and protection against, all discrimination against them, because of their race, in respect of such civil rights as belong to freemen of other races. Congress, therefore, under its express power to enforce that amendment, by appropriate legislation, may enact laws to protect that people against the deprivation, *on account of their race*, of any civil rights enjoyed by other freemen in the same State; and such legislation may be of a direct and primary character, operating upon States, their officers and agents, and also upon, at least, such individuals and corporations as exercise public functions and wield power and authority under the State. What has been said is sufficient to show that the power of Congress under the thirteenth amendment is not necessarily restricted to legislation against slavery as an institution upheld by positive law, but may be exerted to the extent, at least, of protecting the race, so liberated, against discrimination, in respect of legal rights belonging to freemen, where such discrimination is based upon race."

He then contended that the denial to colored citizens of the equal accommodations and privileges of hotels, public conveyances, and places of amusement, presents a discrimination on account of color, which is a badge of servitude whose imposition Congress is empowered by the thirteenth amendment to prevent. "They are burdens which lay at the very foundation of the institution of slavery as it once existed. They are not to be sustained, except upon the assumption that there is still, in this land of universal liberty, a class which may yet be discriminated against, even in respect of rights of a character so essential and so supreme that, deprived of their enjoyment, in common with others, a freeman is not only branded as one inferior and infected, but, in the competitions of life, is robbed of some of the most essential means of existence; and all this solely because they belong to a particular race which the nation has liberated. The thirteenth amendment alone obliterated the race-line, so far as all rights fundamental in a state of freedom are concerned."

Justice Harlan proceeded to maintain that power was given to Congress by the fourteenth

amendment also to enact such a civil-rights law as that of 1875. He said:

The assumption that this amendment consists wholly of prohibitions upon State laws and State proceedings in hostility to its provisions, is unauthorized by its language. The first clause of the first section—"all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States, and of the State wherein they reside"—is of a distinctly affirmative character. In its application to the colored race, previously liberated, it created and granted, as well citizenship of the United States as citizenship of the State in which they respectively resided. It introduced all of that race whose ancestors had been imported and sold as slaves, at once, into the political community known as the "people of the United States." They became, instantly, citizens of the United States, and of their respective States. Further, they were brought, by this supreme act of the nation, within the direct operation of that provision of the Constitution which declares that "the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States" (Art. IV, sec. 2).

The citizenship thus acquired, by that race, in virtue of an affirmative grant by the nation, may be protected, not alone by the judicial branch of the Government, but by congressional legislation of a primary direct character; this, because the power of Congress is not restricted to the enforcement of prohibitions upon State laws or State action. It is, in terms distinct and positive, to enforce "the provisions of *this article*" of amendment; not simply those of a prohibitive character, but the provisions—all of the provisions—affirmative and prohibitive, of the amendment. It is, therefore, a grave misconception to suppose that the fifth section of the amendment has reference exclusively to express prohibitions upon State laws or State action. If any right was created by that amendment, the grant of power, through appropriate legislation, to enforce its provisions, authorizes Congress, by means of legislation, operating throughout the entire Union, to guard, secure, and protect that right. . . .

Although this Court has wisely forbore any attempt, by a comprehensive definition, to indicate all of the privileges and immunities to which the citizens of each State are entitled, of right, to enjoy in the several States, I hazard nothing, in view of former adjudications, in saying that no State can sustain her denial to colored citizens of other States, while within her limits, of privileges or immunities, fundamental in republican citizenship, upon the ground that she accords such privileges and immunities only to her white citizens and withholds them from her colored citizens. The colored citizens of other States, within the jurisdiction of that State, could claim, under the Constitution, every privilege and immunity which that State secures to her white citizens. . . . No State may, by discrimination against a portion of its own citizens of a particular race, in respect of privileges and immunities fundamental in citizenship, impair the constitutional right of citizens of other States, of whatever race, to enjoy in that State all such privileges and immunities as are there accorded to her most favored citizens. A colored citizen of Ohio or Indiana, being in the jurisdiction of Tennessee, is entitled to enjoy any privilege or immunity, fundamental in citizenship, which is given to citizens of the white race in the latter State. It is not to be supposed that any one will controvert this proposition.

But what was secured to colored citizens of the United States—as between them and their respective States—by the grant to them of State citizenship? With what rights, privileges, or immunities did this grant from the nation invest them? There is one, if there be no others—exemption from race discrimination in respect of any civil right belonging to citizens of the white race in the same State. That, surely, is their constitutional privilege when within the juris-

diction of other States. And such must be their constitutional right in their own State, unless the recent amendments be "splendid baubles," thrown out to delude those who deserved fair and generous treatment at the hands of the nation. Citizenship in this country necessarily imports equality of civil rights among citizens of every race in the same State. It is fundamental in American citizenship that, in respect of such rights, there shall be no discrimination by the State, or its officers, or by individuals or corporations exercising public functions or authority, against any citizen because of his race or previous condition of servitude.

After repeating that the opinion of the majority proceeds on the ground that the power of Congress to legislate for the protection of the rights and privileges secured by the fourteenth amendment can not be brought into activity except with the view, and as it may become necessary, to correct and annul State laws and State proceedings hostile to such rights and privileges, and that, in the absence of State laws or State action adverse to such rights and privileges, the nation may not actively interfere for their protection and security, Justice Harlan adds:

If the grant to colored citizens of the United States of citizenship in their respective States, imports exemption from race discrimination, in their States, in respect of the civil rights belonging to citizenship, then, to hold that the amendment remits that right to the States for their protection, primarily, and stays the hands of the nation, until it is assailed by State laws or State proceedings, is to adjudge that the amendment, so far from enlarging the powers of Congress—as we have heretofore said it did—not only curtails them, but reverses the policy which the General Government has pursued from its very organization. Such an interpretation of the amendment is a denial to Congress of the power, by appropriate legislation, to enforce one of its provisions. In view of the circumstances under which the recent amendments were incorporated into the Constitution, and especially in view of the peculiar character of the new rights they created and secured, it ought not to be presumed that the General Government has abdicated its authority, by national legislation, direct and primary in its character, to guard and protect privileges and immunities secured by that instrument. Such an interpretation of the Constitution ought not to be accepted if it be possible to avoid it. Its acceptance would lead to this anomalous result: that whereas, prior to the amendments, Congress, with the sanction of this court, passed the most stringent laws—operating directly and primarily upon States and their officers and agents, as well as upon individuals—in vindication of slavery and the right of the master, it may not now, by legislation of a like primary and direct character, guard, protect, and secure the freedom established, and the most essential right of the citizenship granted, by the constitutional amendments. I venture, with all respect for the opinion of others, to insist that the national Legislature may, without transcending the limits of the Constitution, do for human liberty and the fundamental rights of American citizenship what it did, with the sanction of this court, for the protection of slavery and the rights of the masters of fugitive slaves. If fugitive-slave laws, providing modes and prescribing penalties, whereby the master could seize and recover his fugitive slave, were legitimate exertions of an implied power to protect and enforce a right recognized by the Constitution, why shall the hands of Congress be tied, so that—under an express power, by appropriate legislation, to enforce a constitutional provision, granting citizenship—it may not, by means of direct legislation, bring the whole power of this nation to bear upon States and their officers,

and upon such individuals and corporations exercising public functions as assume to abridge, impair, or deny rights confessedly secured by the supreme law of the land?

Justice Harlan further maintained that the decision of the Court was erroneous, even conceding that Congress has power to legislate only against hostile State action. He pointed out that the court had held, in *Ex-parte Virginia* (100 U. S. Reports), that the fourteenth amendment means that no agency of the State, or of the officers or agents by whom its authority is exercised, shall deny to any person equal protection of the laws, and then said: "In every material sense applicable to the practical enforcement of the fourteenth amendment, railroad corporations, keepers of inns, and managers of places of public amusement, are agents of the State, because amenable, in respect of their public duties and functions, to public regulation. It seems to me that, within the principle settled in *Ex-parte Virginia*, a denial, by these instrumentalities of the State, to the citizen, because of his race, of that equality of civil rights secured to him by law, is a denial by the State within the meaning of the fourteenth amendment. If it be not, then that race is left, in respect of the civil rights under discussion, practically at the mercy of corporations and individuals wielding power under public authority."

Justice Harlan conceded that Congress has no authority to regulate the social rights of men and races in the community, but he claimed that the rights covered by the law of 1875 were not social but legal. He set forth his views on this point as follows:

I agree that Government has nothing to do with social, as distinguished from technically legal, rights of individuals. No government ever has brought, or ever can bring, its people into social intercourse against their wishes. Whether one person will permit or maintain social relations with another is a matter with which government has no concern. I agree that if one citizen chooses not to hold social intercourse with another, even upon grounds of race, he is not and can not be made amenable to the law for his conduct in that regard; for no legal right of a citizen is violated by the refusal of others to maintain merely social relations with him. What I affirm is that no State, nor the officers of any State, nor any corporation or individual wielding power under State authority for the public benefit or the public convenience, can, consistently either with the freedom established by the fundamental law, or with that equality of civil rights which now belongs to every citizen, discriminate against freemen or citizens, in their civil rights, because of their race, or because they once labored under disabilities imposed upon them as a race. The rights which Congress by the act of 1875 endeavored to secure and protect are legal, not social, rights. The right, for instance, of a colored citizen to use the accommodations of a public highway, upon the same terms as are permitted to white citizens, is no more a social right than his right, under the law, to use the public streets of a city, or a town, or a turnpike-road, or a public market, or a post-office, or his right to sit in a public building with others, of whatever race, for the purpose of hearing the political questions of the day discussed. Scarcely a day passes without our seeing in this court-room citizens of the white and black races sitting side by side, watch-

ing the progress of our business. It would never occur to any one that the presence of a colored citizen in a court-house, or court-room, was an invasion of the social rights of white persons who may frequent such places. And yet, such a suggestion would be quite as sound in law—I say it with all respect—as is the suggestion that the claim of a colored citizen to use, upon the same terms as is permitted to white citizens, the accommodations of public highways, or public inns, or places of public amusement, established under the license of the law, is an invasion of the social rights of the white race.

The opinion of Justice Harlan closes with the expression of these views:

My brethren say that, when a man has emerged from slavery, and by the aid of beneficent legislation has shaken off the inseparable concomitants of that state, there must be some stage in the progress of his elevation when he takes the rank of a mere citizen, and ceases to be the special favorite of the laws, and when his rights as a citizen, or a man, are to be protected in the ordinary modes by which other men's rights are protected. It is, I submit, scarcely just to say that the colored race has been the special favorite of the laws. What the nation, through Congress, has sought to accomplish in reference to that race, is—what had already been done in every State of the Union for the white race—to secure and protect rights belonging to them as freemen and citizens, nothing more. The one underlying purpose of congressional legislation has been to enable the black race to take the rank of mere citizens. The difficulty has been to compel a recognition of their legal right to take that rank, and to secure the enjoyment of privileges belonging, under the law, to them as a component part of the people for whose welfare and happiness government is ordained. At every step in this direction the nation has been confronted with class-tyranny, which a contemporary English historian says is, of all tyrannies, the most intolerable, "for it is ubiquitous in its operation, and weighs, perhaps, most heavily on those whose obscurity or distance would withdraw them from the notice of a single despot." To-day it is the colored race which is denied, by corporations and individuals wielding public authority, rights fundamental in their freedom and citizenship. At some future time it may be some other race that will fall under the ban. If the constitutional amendments be enforced, according to the intent with which, as I conceive, they were adopted, there can not be in this republic any class of human beings in practical subjection to another class, with power in the latter to dole out to the former just such privileges as they may choose to grant. The supreme law of the land has decreed that no authority shall be exercised in this country upon the basis of discrimination, in respect of civil rights, against freemen and citizens because of their race, color, or previous condition of servitude. To that decree—for the due enforcement of which, by appropriate legislation, Congress has been invested with express power—every one must bow, whatever may have been, or whatever now are, his individual views as to the wisdom or policy, either of the recent changes in the fundamental law, or of the legislation which has been enacted to give them effect.

The decision of the Court, and the dissenting opinion of Justice Harlan, gave rise to much discussion throughout the country. By some the opinion of the majority was freely criticized, but it appears to have been generally accepted as a sound as well as a final interpretation of the Constitution. The fact was recognized that the Court simply reaffirmed a principle which it had more than once previously affirmed, and had advanced as far back as the session of 1875-'76. On the meeting of Con-

gress, Senator Wilson, of Iowa, proposed this constitutional amendment:

Congress shall have power, by appropriate legislation, to protect citizens of the United States in the exercise and enjoyment of their rights, privileges, and immunities, and to assure to them the equal protection of the laws.

The New York Penal Code contains these provisions concerning civil rights:

SECTION 381. A person who either on his own account, or as agent or officer of a corporation, carries on business as innkeeper, or as common carrier of passengers, and refuses, without just cause or excuse, to receive and entertain any guest, or to receive and carry any passenger, is guilty of a misdemeanor.

Sec. 383. No citizen of this State can, by reason of race, color, or previous condition of servitude, be excluded from the equal enjoyment of any accommodation, facility, or privilege furnished by innkeepers or common carriers, or by owners, managers, or lessees of theatres or other places of amusement, by teachers and officers of common schools and public institutions of learning, or by cemetery associations. The violation of this section is a misdemeanor, punishable by a fine of not less than fifty dollars nor more than five hundred dollars.

CIVIL-SERVICE REFORM BILL. See CONGRESS AND REFORM IN THE CIVIL SERVICE.

COLENZO, John William, an English clergyman and colonial bishop, born in St. Austell, Cornwall, Jan. 24, 1814; died in D'Urban, or Port Natal, South Africa, June 20, 1888. He entered St. John's College, Cambridge, and in 1836 was graduated as second wrangler and Smith's prizeman, and became a fellow of his college. Two years later he was appointed assistant-master of Harrow School, which post he held until 1842. During these years he prepared books on arithmetic and algebra, which, being adopted as text-books in schools and universities, yielded him a handsome income. From 1842 to 1846 he resided at his college, and then became rector of Fornsett St. Mary, Norfolk. Besides giving due attention to his parish work and duties, Colenso published other mathematical works, a volume of "Village Sermons," and a treatise on the communion service in the Prayer-Book, with selections from the writings of F. D. Maurice.

On the 30th of November, 1858, Dr. Colenso was appointed Bishop of Natal, South Africa, being the first to occupy that see. His "Ten Weeks in Natal" was published two years after he left England, and his "Translation of the Epistle to the Romans, commented on from a Missionary Point of View," appeared in 1861. It is not known clearly how long Bishop Colenso had been engaged in studying the Old Testament, with reference to critical points at issue; but it is quite likely that the matter had been before him for years. At any rate, he considered it a duty, as appears from his course, to put forth views which at once excited severe animadversion and astonishment at his lapse from Anglican orthodoxy, and his adoption of German rationalism and neology.

The first part of "The Pentateuch and Book of Joshua critically examined" appeared in

1862. As was to be expected, this assault on the accuracy, veracity, and authorship of the books of Moses was at an early day brought before the authorities of the Church in England, and both Houses of Convocation of the Province of Canterbury condemned it in 1864, as containing "errors of the gravest and most dangerous character." That work was reviewed in several of the prominent organs of free thought and of orthodox religion (chiefly the "Westminster" and "Quarterly" Reviews). On the one hand, Colenso was praised without stint, as a noble champion of truth and a fearless critic of the Old Testament; on the other, he was censured with corresponding severity, as one who showed himself ignorant and presumptuous beyond all excuse; and it was urged that no honorable and upright man would be willing to continue to minister at the altars, or receive emoluments from a church, whose doctrines on inspiration and other fundamental points he denied and was holding up to public odium.

The next step on the part of the Church in South Africa was the presenting and summoning Bishop Colenso for trial, and, on his refusal to appear, the deposing him from his bishopric by the metropolitan, Bishop Gray of Cape Town. Dr. Colenso resolved not to submit to the ecclesiastical authorities in the colony, and the result was that this case was brought on appeal before the courts in England. The matter was argued at length, and it was decided by the Privy Council, in March, 1865, that the deposition was "null and void in law," the ground of the decision being that the crown has no legal power to constitute a bishopric, or to confer coercive jurisdiction within any colony possessing an independent legislature; and that, as the letters-patent purporting to create the sees of Cape Town and Natal were issued after these colonies had acquired legislatures, the sees did not legally exist, and neither bishop possessed in law any jurisdiction whatever. Notwithstanding this decision, the bishops forming the Council of the Colonial Bishopric's Fund refused to pay Dr. Colenso the income of the see of Natal. He accordingly appealed to the Court of Chancery, and the Master of the Rolls delivered a judgment, Oct. 6, 1866, ordering the payment in future of his income, with all arrears and interest. Thus the income was secured to him for life, and, so far as the decision of the civil courts could affect it, he remained in possession of the see as its bishop. The Church in South Africa, however, held that he was lawfully and fully deposed, and would have no intercourse or fellowship with him. Dr. Colenso ministered to those who thought him right and supported him; while the orthodox portion of the church community looked upon him as one deprived of all power lawfully to exercise the functions of the episcopal office. Nevertheless, the occupant of the see of Natal had numerous sympa-

thizers in England, and in the summer of 1865 a meeting of the subscribers to the "Colenso fund" was held in London, when £3,300 were presented to him, as a token of respect and good-will, on his going back to Africa.

Ten years later he made another visit to England, in order to report to the proper authorities the condition of church affairs in Cape Colony; to ascertain, if possible, his relationship to the new Bishop of Cape Town; and to arrange other matters in the existing anomalous condition of church life and work in that distant field. During his stay in England, the Bishops of Oxford, Lincoln, and London inhibited him from preaching in their respective dioceses, as one having no lawful authority to preach. Dr. Jowett, however, whose sympathies doctrinally were with Colenso, invited him to preach in the chapel of Balliol College, that chapel not being within the jurisdiction of the Bishop of Oxford.

Dr. Colenso's later life was passed quietly in Natal. He was noted for his kindly interest and zeal in behalf of the Zulus and Boers.

He published at intervals the remaining parts of his work on the Pentateuch and the Book of Joshua. In 1866 a volume of discourses appeared, entitled "Natal Sermons." Besides these he prepared and had printed a Zulu grammar and Zulu dictionary, a Zulu translation of the New Testament and other parts of the Bible and Prayer-Book, with several educational works for the instruction of the Zulus. His latest publications were, "The New Bible Commentary, by Bishops and other Clergy of the Anglican Church, critically examined" (1871); the sixth part of "The Pentateuch and the Book of Joshua critically examined" (1872); and "Lectures on the Pentateuch and the Moabite Stone" (1873).

COLLISIONS, MARINE. The increasing frequency of marine disasters with the extension of steam navigation leads to a general demand for more effective precautions against collision.

Proposed Navigation Laws.—Since quick passages attract more custom to navigation companies than a reputation for safety, it has been proposed to sharpen the penalties for infringing the maritime laws against rapid sailing in bad weather. In Germany, where the laws are already exceptionally stringent, the suggestion is made to bring such infraction within the provisions of the statutes against murder and attempted murder. The captain only would be liable to indictment, although the ship-owner is primarily and principally responsible. A remedy would be found in making them liable in cases of disaster to pecuniary damages, in the same manner as railroad companies. It is equally desirable to restrict the rate of speed. The terms "half-speed" and "slow" are indefinite, owing to the difference in the speed of different vessels. To insure the highest degree of safety, steamers should be prohibited, in fogs, driving snows, and on dark nights, from going faster than

the rate required for steering. This can be accurately determined for each vessel. The present English law requires steam-vessels to have both a steam-whistle and a fog-horn, and in a fog to go at moderate speed and sound their whistles frequently. Masters neglecting the rules are liable to prosecution, and in the event of a collision are punishable for willful neglect.

Signal-Lights.—The use of electric lights is not regarded with much favor by seamen. It is not yet proved that the electric light will penetrate a fog much farther than the ordinary lamps, in such a manner as to indicate its distance and location. It would probably obscure the red and green side-lights, unless they could also be provided with electric lamps, and the colored side-lights are considered absolutely indispensable. If colored electric lights could be produced, and the electric light should prove to be sufficiently clear and distinct to be made out at a greater distance than oil and petroleum lamps, the risk of colliding with other steamers and large vessels carrying electric lanterns would be lessened, but the danger of running down smaller craft which must use the ordinary lights would be enhanced, as the blinding effects of the electric light would render it difficult to distinguish the colored lights in the neighborhood of one lighted with electricity. There is danger also of confounding an electric top-light with a light-house lantern. More practical is the suggestion to hang the white light of a ship as high as possible, and to maintain a watch at the mast-head in foggy weather. The fog is usually thickest near the surface of the water.

Sound-Signals.—The proposal of a system of sound-signals to indicate the course of vessels approaching one another meets with general approval. By combinations of short and long blasts, on the principle of the Morse alphabet in telegraphy, sixteen of the thirty-two directions marked on the compass, which would be sufficient for all practical purposes, could be readily and intelligibly signaled. If only eight points of the compass were embraced in the signals, the advantages would be unquestionable, and every sailor would understand the signs. George Read, in England, has devised a simple apparatus for automatically signaling the course of a vessel by means of colored lanterns suspended from the ends of a spar which changes its position in obedience to the movements of the helm.

Steering-Gear and Brakes.—Certain improvements in construction have been proposed to enable steamers to mind their helm more readily, or slow up more quickly. The ship's brakes proposed by two or three different inventors will accomplish either object. They consist of two strong plates fastened by hinges to the ship's sides, opposite each other, and are ordinarily folded forward against the side of the vessel; but the chains holding them can be paid out until they stand at right angles

to the wall, and quickly reduce the momentum of the ship. If one only is released, it acts as a rudder to turn the course of the ship to that side. A brake of this kind, designed by John McAdam, of New York, consists of a flat rectangular plate of iron on each side of the ship, close to the rudder. When folded, these fins fit into the dead-wood. Powerful springs, worked from the pilot-house by a trigger, draw the pins which hold the brakes in place, and the pressure of the water immediately extends them until they stand at right angles to the sides of the ship. A windlass winds them back again. When tried in November on the steamer Florence in New York harbor, going at a speed of ten knots against the tide, they brought the ship to a dead stop within her own length, the engines being reversed at the instant the brakes were applied.

A second rudder in the bow, which can be unfastened in foggy weather, but is ordinarily a rigid continuation of the keel, has been suggested as another contrivance for improving the steering capacity of ocean-steamers. A third device is the lattice-keel, which has been used for many years on river-steamers in the Weser and Elbe. The stern part of the keel, called the dead-wood, consists of grating instead of solid plates, so that in turning the greater part of the water passes through the openings and offers no resistance to the sidelong motion of the ship.

Water-tight Compartments.—The complete avoidance of collisions is impossible. Consequently means must be provided to diminish the dangers in case of collision. Naval iron-clads are constructed with double hulls, besides water-tight compartments. In the large passenger-steamships it is usually attempted to render the ship secure from sinking by dividing the interior into water-tight compartments by vertical walls or movable doors. These compartments must not be so large that the filling of one or two of them with water will sink the ship, the walls must be strong enough to withstand the pressure of the column of water, tight enough to prevent the escape of water into the neighboring compartments, and, if adjustable, they must be closed at the time of danger. These conditions are rarely fulfilled, and there is probably no iron steamship which would not sink if struck by a ship in certain quarters.

Life-saving Appliances.—The number of life-boats usually provided is sufficient to hold all hands on trading-vessels, but on the passenger-steamers which cross the Atlantic there is not davit-room for boats enough to seat the passengers and crew. Moreover, it often happens that only the boats on one side or in one part of the ship can be lowered. Cork jackets and swimming-belts are of little value when accidents occur in mid-ocean or in winter. The laws require that life-preservers should be provided in sufficient numbers, and kept unfastened in handy places. The life-preservers which must be carried on the Atlantic emi-

grant-steamers take up room that is sometimes desired for the cargo, and their stowage often occasions inconvenience. They are usually packed between the deck-beams, and it may be that in the crowded space between decks they sometimes harbor the germs of infection. It is necessary that passengers should be made acquainted with the use of life-preservers. In the catastrophe of Jan. 19, 1888, when the English coal-steamer Sultan collided with the German passenger-steamer Cimbria, only a small portion of the life-preservers came into use, and those were of little avail, as the swimmers soon perished in the cold. The four boats which set out from the sinking vessel rescued 65 persons, but the rest of the passengers and crew, who numbered altogether 522, were lost. Life-rafts are now regarded by many as preferable in most respects to boats or any other life-saving appliances.

The inspection of foreign passenger-vessels in the United States is assigned to boards of inspectors at six of the principal ports. The boards at Boston, Baltimore, Philadelphia, New Orleans, and San Francisco consist of two inspectors each, that at New York of six. Rules for their guidance were issued by Secretary of the Treasury Folger on March 10, 1883. The law requires that the tackle for disengaging the life-boats should be capable of being worked by a single person, and so disposed that the boats can be launched, both ends being lowered at once, when the ship is going at full speed. This provision is not insisted upon, as no workable single-hand disengaging apparatus has yet been invented. The rule of the British Board of Trade respecting the number of life-boats to be carried is, that there should be six or seven boats, 1,892 cubic feet in total capacity, for vessels of 1,500 tons, and an additional boat with the capacity of 495 feet for every 500 tons additional. For the larger Atlantic steamers, running up to 8,500 tons, this requirement is incapable of fulfillment. Even if it could be carried out, the total complement of boats would accommodate less than half the number of persons usually carried on the emigrant-steamers.

Mid-Ocean Disasters.—To enable vessels in distress to be relieved in the Atlantic ocean, the adoption of fixed routes or lanes for all ships crossing between Europe and America is advocated, one for the east- and one for the west-bound navigation. To guard against collisions with icebergs, which was the probable cause of the loss of several steamships, a delicate instrument on the principle of Edison's heat-measurer has been devised by an English inventor, which can herald a sudden fall of the temperature by means of an automatic alarm.

COLOMBIA (*Estados Unidos de Colombia*). (For statistics relating to area, see "Annual Cyclopædia" for 1877.) The republic is composed of nine States and five Territories, the States being Antioquia, Bolívar, Boyacá, Cauca, Cundinamarca, Magdalena, Panamá, Santan-

der, and Tolima. The names of the Territories are Bolívar, Casanare, Goajira, Providencia, and San Martín. The form of government is democratic, and the system federal.

The executive of the confederacy is President Dr. José E. Otálora. The Cabinet is composed of the following ministers: Secretary of State, Señor Ezequiel Hurtado; War, Señor Juan N. Mateus; Finance, Señor Anibal Galindo; Public Works, Señor Manuel Laza Grau; Foreign Affairs, Señor Antonio Rodan; Public Instruction, Señor J. V. Uribe; and Treasury, Señor Alejandro Posada.

On Sept. 2, 1883, Dr. Nuñez was elected President, and he will be inaugurated in February, 1884. Dr. Nuñez is fifty years of age. He was First Consul-General at Liverpool, and subsequently President of the State of Bolívar. He was a candidate for the presidency of Colombia in 1875, when Dr. Parra was elected, but in 1879 he was elected President, his successor being Gen. Zaldera, who died on Dec. 21, 1882, and whose successor was Dr. Otálora, the present occupant of the presidential chair.

The United States minister at Bogotá is Mr. W. L. Scruggs.

The population of Colombia is estimated at 4,000,000 souls.

According to the last census, the population of the capitals of the States was as follows: Panamá, 36,000; Santa Marta, 3,500; Cartagena, 7,800; Socorro, 16,000; Medellín, 20,000; Tunja, 5,471; Bogotá, 40,888; Ibaguë, 10,346; and Popayan, 8,485.

The General Government possesses the right of intervention in matters relative to lines of interoceanic communication at present existing, or which in the future may be opened in the territory of the Union, and in the navigation of rivers flowing through more than one State, or which pass to or from a neighboring power.

The Magdalena river flows into the Atlantic at a point called the Bocas de Ceniza. At a distance of fifteen miles from its mouth, on the left bank, is the city of Barranquilla, the seat of an extensive import and export trade. Barranquilla is connected with the port of Sabanilla by means of a railroad fourteen miles in length. The Bocas de Ceniza, which for a long time were obstructed by a sand-bar at the entrance, are now open to easy access by vessels of large tonnage, and, on account of the privileges conceded of late years by Congress to the commerce of the country, they are frequently visited by steamers and sailing-vessels from abroad. Owing to the shifting of the bar, however, steamers do not at present enter the river. To aid the entry of sailing-craft, the Government has established a tug-boat service.

For the purpose of navigation the Magdalena is divided into the upper and lower Magdalena. The former is included between the cities of Neiva and Honda, 200 miles, and the

latter comprises the portion from Caracoli to the mouth of Ceniza. The distance between the Laguna de las Pampas and Barranquilla is 515 miles. The waters of the Magdalena are entirely free to commerce, and there are at present seventeen steamers navigating it.

Stern-Wheel Steamers.—Messrs. Yarrow & Co., of Poplar, England, have built a steamer of this kind specially for the Magdalena. A speed of thirteen miles an hour has been obtained in river-steamers of this class, the length being 120 feet, by 24 feet beam, and the draught 12 inches. A speed of fifteen miles an hour is attained by vessels 180 feet in length, by 28 feet beam, and a draught of 15 inches. The dimensions of this new steamer are, exclusive of the wheel, 150 feet in length, by 31 feet beam, with an estimated draught of 15 inches.

Army.—The standing army of Colombia, or National Guard, numbers about 3,000 men.

Finance.—The national budget for the fiscal year 1888 estimated the income from import duties at \$3,800,000; from the salines, at \$1,100,000; from other sources of revenue, \$1,344,000, constituting a total of \$6,244,000, while the expenditure was fixed at \$6,744,000, the outlays figuring therein with \$1,800,000 to be spent by the Treasury Department, and \$1,400,000 by that of the army and navy.

A message sent in to Congress by President Otálora, in July, 1883, attracted much attention; in this document he said:

The monetary crisis becomes more serious every day, and members must adopt some definite plan respecting the State indebtedness by consolidating the different issues. Our creditors must be more interested in this matter than ourselves, because otherwise ultimately it will be impossible to avoid further issues of obligations against branches assigned for other services. Since we are unable to cover the millions of the enormous deficit against the Treasury, we must endeavor to maintain the value of our bonds by assuring the punctual payment of current interest until such time as the financial situation shall improve. It is also requisite that the principal bases should be fixed by law, upon which, without awaiting subsequent authorization from Congress, final arrangements can be effected in Europe for the acknowledgment and payment by the canal company and the railroad company of the credits we hold against them for indemnity due as under the contracts for the concessions. It would not be wise that such law should place a limit on our rights, thus prejudicing our suits; but you must give a vote of confidence to the Executive, which will come to no arrangement which has not been carefully and thoroughly studied by the Cabinet and its officers. The agent intrusted with the *ad referendum* agreement has already been instructed to dispose of the funds as follows: \$1,000,000 to be given to the National Bank, to enable it to effect discounts at 5 per cent.; \$500,000 to be devoted to the payment of overdue interest on foreign bonds under an agreement which shall insure the acceptance of such payment at the rate of 3 per cent., commencing in the first place at 1 per cent.; \$500,000 for the purchase of articles required for the schools, clothing and armament for the army, and for various objects of art to be placed in the Capitol, and the balance to be devoted to the construction of a railroad from Bogotá to the Magdalena.

The amount of duties collected by the Federal custom-houses during the fiscal year 1882-

'88 was \$4,350,478, being \$45,512 in excess of what the revenue from this source had been the preceding year.

The public indebtedness of the confederacy stood on Aug. 31, 1862, as follows:

A. Foreign debt (consolidated) }	
B. Home debt (loan of 1878) }	\$9,570,500
Consolidated debt.....	5,583,801
Floating debt.....	435,388
“ “ 3 per cent.....	1,313,350
“ “ not bearing interest.....	550,710
Antioquia and Girardot railroads.....	573,500
Treasury bonds.....	26,863
Bonds for which the state's salt-works and customs receipts are pledges.....	1,165,049
Other outstanding bonds.....	1,693,011
Indemnity to foreigners.....	253,450
Purchase-money for Barranquilla railroad.....	420,000
Total.....	\$21,589,527

Banks.—The Bank of Bogotá, in ten years, has paid a little over 100 per cent. in dividends. The Bank of Colombia, in five years, has paid 83 per cent. The Banco Popular, in three years, has paid over 55 per cent. The national Government has no supervision over any of the banks except the National Bank, which is nothing more than an institution established for the purpose of discounting the Government's own obligations. As an example, the Government fails to pay the pensions for five or six months; those who should receive them are suffering from want, and the National Bank steps in and offers to discount them. In this way the Government makes a large profit. Nearly if not all the stock of the National Bank is owned by the Government. All the other banks derive their powers from State governments, and are never taxed, except in case of a revolution, when they are all liable to be visited by the various chiefs. The only security for the circulation of the banks is the individual liability of the stockholders. There are four banks doing business in Barranquilla. Three of them have a combined capital of \$1,000,000, the other being a branch of the National Bank of Bogotá. The private banks are organized under the laws of the State of Bolivar, which are much the same as were those of the State of New York twenty-five years ago. The majority of the capital of the American Bank belongs to citizens of the United States, being divided as follows: American citizens, \$295,000; British subjects, \$260,000; Colombians, \$10,000. The rates of discount are: 90 days, 8 per cent.; 180 days, 9 per cent.; rates of interest, 3 per cent. and 4 per cent. for 180 and 90 days; rates of exchange on New York, 27 per cent. and 28 per cent. for sight drafts, and 25 and 26 per cent. for 60 and 90 days' drafts; on London, 24 per cent. and 25 per cent. Toward the close of 1883 another bank with a large capital was to be established at Barranquilla.

Contested Limits.—There being a long-pending dispute about the precise frontier line between Colombia and Venezuela, the Governments have submitted the difference to the arbitration of Don Alfonso XII, King of Spain, who has accepted the office, and by virtue of a decree is-

sued in November, 1888, appointed a committee of inquiry composed of five members. The investigation will have to take for a basis of its deliberations the frontier treaty between the two republics, of Sept. 14, 1881. Frontier disputes having so frequently led to disastrous wars between Spanish-American republics, the tendency is to avail themselves in the future of amicable arbitration.

Postal Service.—There were forwarded in 1879-'80 altogether 468,882 letters and 418,850 newspapers, and \$2,288,974 in coin, besides 4,920 kilogrammes of gold-dust and 14,348 kilogrammes of bar-silver.

Railroads.—There were in operation in 1888 the ensuing lines of railway: 1. The Panamá railroad, 47 miles; 2. The 17 miles from Sabanilla to Barranquilla, in the State of Bolívar; 3. Of the Cucuta-Puerto Villamizar line (on the Zulia river); 88 miles were being built, and part of it—12 miles—from Villamizar to Altoviento, were in operation; 4. The line from Buenaventura to Córdoba, 18 miles; 5. The line from Puerto Berrio to Zabaletas, 20 miles: together, 110 miles in operation. There was formed in New York in 1888 "The Bogotá City Railway Company," a company proposing to establish in the Federal capital and elsewhere in the State of Cundinamarca a system of tramways and narrow-gauge railroads, with a capital of \$2,500,000.

Telegraphs.—Length of lines in 1879-'80, 2,960 kilometres; and number of telegrams forwarded, 150,204.

The Panama Canal.—The progress of the work on the Panamá canal at the end of October, 1888, is shown by the following statement: "The total length of the canal is 74 kilometres, from the Atlantic to its mouth in the Pacific, at the islands of Naos and Flamenco. It is divided into twelve sections, the most important of which are those of Colon, Gorgona, Obispo, Emperador, Oulebra, and Paraiso. These united sections employ daily 80 steam-excavators, 40 locomotives, and 800 tip-wagons. There are 90,000,000 cubic metres to be excavated. The grand cutting, about two thirds of which has already been excavated, is the cutting between Obispo and Paraiso. The force employed upon the work is upward of 10,000 men, and the excavation up to the 1st of October amounted to more than 2,500,000 cubic metres. During these latter months of the bad season the excavations have amounted to about 350,000 metres a month. This figure will be quintupled during the fine season, which begins in December, and next year (1884) nearly all of the necessary machinery will be at work, and the excavations will amount to 4,000,000 metres a month. The working force will be augmented to 15,000 men.

"At Colon the port works are nearly complete. The Terre Pleine, with the breakwater, destined to diminish the effect of the heavy seas at the entrance of the canal, is finished. An entire town has appeared there, with a

collection of workshops, warehouses, and connecting railways for the reception and distribution of the material. The earth from Terre Pleine was taken to Monkey Hill, where a great cutting has been specially opened, with the object of filling up the lagoons at the bottom of the Bay of Colon to improve its sanitary condition. This cutting at Monkey Hill will itself be enlarged into Terre Pleine, and will become an annex for stores, workshops, warehouses, etc. The port of Colon is dredged continually by three machines, lifting together daily from 6,000 to 7,000 metres. One of these dredges can work during the worst weather, and can lift 8,000 metres a day. From Colon to Gatun the contractors are Messrs. Huerne & Slavin, of San Francisco. These engineers must, with three machines of 120 horse-power each, open the first section in six months between Colon and Gatun, a distance of nine kilometres. The first of these machines is able to excavate 6,000 metres a day. The Pacific opening, between the mouth of the Rio Grande and Paraiso, is contracted for by the Franco-American Trading Company. The first machine of the American system will begin to work in a few days, and will be supplemented by others, which will be necessary to finish this part of the canal, from Gatun to Bahía del Soldado, in two years. On the Atlantic side the company are working two machines, furnishing a minimum of 4,000 cubic metres a day.

"The Hercules, an American dredge, is at length at work on the Panamá canal, and is giving satisfaction. The average day's work at present may be set down as about 6,000 cubic metres."

Since the establishment of the canal-works the population of Panamá has increased enormously. Including Colon and Panamá, the Atlantic and Pacific termini of the canal, together with the villages between them, there is a population of 86,000, half of whom are negroes from Jamaica. The climate during the dry season—December to April—exhibits a steady temperature of about 82° Fabr.; but during the rest of the year, when rain and storms prevail, it is much hotter. Accidents from lightning are common, and are likely to continue, for in the city of Panamá there is not a lightning-rod to be found. There is no muton in the country, and, when any lucky resident is able to procure a joint, he invites his friends to partake of the unusual delicacy. The Indian equivalent for the word Panamá is "plenty of fish," and plenty there is, with the difference that those which are taken from the Atlantic side of the Isthmus are far superior to those on the Pacific side, which are not firm, and become tainted very soon after they leave the water. The Isthmus for fifty years had been free from earthquake-shocks till September, 1882. On Aug. 29, 1888, earthquakes were felt in Salvador, Colombia, and Ecuador, while at Talcahuano, Chili, on August 28th, the water rose two feet above high-water mark, and al-

most immediately afterward fell three feet. During the last week in August noises such as that produced by continuous firing during a battle, were heard at Obiman, within sixty miles of Panamá, in all the towns on the Bogotá plateau, and at Manabi, in Ecuador. On September 2d the sun at Panamá and Guayaquil was discolored, almost at the moment when the fearful eruptions and earthquakes were destroying a portion of Java and adjacent islands. On September 10th, a sharp earthquake, which did no damage, was felt in Lima, and was about coincident with that felt in the Western United States the same morning.

In July, 1888, the dispute between the Federal Government of Colombia and the canal company, with reference to the payment of the police force, which is required to maintain order and good government along the line of work, had been amicably terminated in Bogotá by Señor Anibal Galindo, the Secretary of the Treasury at the time, and Señor Felipe Paul, the representative of the canal directory. Under this arrangement the canal company agrees to pay the Federal Government the expenses, estimated at \$80,000 per annum, of maintaining a force of 800 men, to be stationed along the canal line, and leaves for future discussion the amount to be paid should more men be necessary. This contract, which also permitted the treasurer to draw at sight for \$50,000 on account, had been submitted to the Executive.

Pearl-fishing.—The pearl-fishery in the bay of Panamá is being pushed on with great vigor, and with a good deal of success. Many fine specimens have lately been found, including a very finely shaped one called the "Lesseps," weighing nearly 200 grains. It is about the most important that has been in the European market for many years, and takes its place in the list of the largest-known pearls in the world.

Commerce.—The total foreign trade (import and export) of Colombia, during a decade, has been:

		Annual average.
1871-'75	\$92,576,800	\$18,525,360
1876-'80	107,094,400	21,418,880

	Import.	Export.
1878-'79	\$10,787,654	\$18,711,511
1879-'80	10,887,008	18,504,981
1880-'81	12,071,490	15,886,944
1881-'82	12,855,555	18,514,116

The United States consular report, having reference to the export trade from the United States of Colombia to the United States, in 1882, remarks about India-rubber: "The declared value of rubber exported for the last eleven years to the United States is \$1,470,085, and the weight, in tons of 2,240 pounds, 1,994. Although the difficulties in procuring this valuable forest product are becoming yearly greater, yet the recent high prices prevailing in the foreign markets have stimulated its gathering. New and accessible forests have been discovered. When a tree is found by the rubber-hunters, it is immediately felled, in or-

der to secure all the sap it contains. This unwise practice will undoubtedly continue until all the forests are completely exhausted. The present price for rubber in the market of Cartagena is \$900 per ton of 2,240 pounds.

"Owing to the unsatisfactory prices ruling in the foreign markets for ivory-nuts, their exportation has largely decreased. Thousands of tons of these nuts lie under the trees, only awaiting some one to come and cart them away; most of these nuts are procured from the San Blas coast and Atrato river and its tributaries."

Fustic.—"The exportation of the yellow dye-wood called fustic has increased more than any other article on the list, caused mainly by the people being compelled, on account of the locusts, to relinquish agricultural pursuits, and seek a livelihood by getting out the products of the forest. The supply is nearly inexhaustible, and easy of access. The price per ton, delivered at Cartagena, is \$18 to \$16."

Cedar.—"Several New Orleans and Boston timber firms have sent agents to this district, and the result of their investigations of these vast timber-forests have been so highly satisfactory that the houses they represent are making arrangements to get out cedar and mahogany on a large scale. The field is wide enough for any number of firms without their respective interests coming in conflict. The mahogany of this country is of fair quality, but inferior to the St. Domingo product. The quality of the cedar is excellent, and bears comparison with that procured in Mexico and Cuba. Cedar-logs are placed free on board here, at \$45 a thousand feet. The same wood can be procured at Cispaté Bay, a good anchorage for vessels of large tonnage, for \$25 to \$30 a thousand, delivered alongside vessel.

"The value of gold-dust that was cleared through the Cartagena custom-house for the year 1882 was only \$94,628; this, however, does not constitute the real value of the dust exported, as it is always underestimated on account of the steamers charging so much per cent. extra tariff, and frequently large amounts of the dust are placed in the personal charge of the captain. If the truth were known, the value is probably nearer \$500,000 than \$100,000. Cartagena receives annually about \$600,000 of gold-dust from the Choco (Atrato) regions."

The import of merchandise, specie, and bullion from Colombia into the United States during the fiscal year ended June 30, 1882, was \$5,171,455; the domestic export from the latter to the former, \$6,719,787; and the re-export of foreign goods, \$149,184 worth.

Maritime Movement.—There entered Colombian ports in 1881-'82 altogether 1,059 sailing-vessels, of a joint tonnage of 67,876, and 618 steamers, measuring jointly 765,825 tons.

COLORADO. State Government.—The State officers during the year 1888 were: Governor, James B. Grant, Democrat; Lieutenant-Governor, W. H. Meyer; Secretary of State, Mel-

vin Edwards; State Treasurer, Fred. Walsen; Superintendent of Public Instruction, J. O. Shattuck; State Auditor, John O. Abbott; Attorney-General, B. F. Urmy. Supreme Court: William E. Beck, Wilbur F. Stone, and Joseph C. Helm, Justices.

Legislative Session.—The Legislature convened at the beginning of January, and remained in session about two months. After a prolonged contest, Thomas M. Bowen (Republican) was elected United States Senator for the long term, and H. A. W. Tabor (Republican) for the short term. Among the measures that became laws were the following:

An act to secure the collection and publication of agricultural and other statistics; an act to submit to the people at the next general election for members of the Legislature, amendments to the Constitution relating to the compensation of members, the length of sessions, and the conduct of business; appropriating \$318,000 for the ordinary expenses of the executive, legislative, and judicial departments for the years 1883 and 1884; submitting to the people at the election in November, 1883, the question of creating a bonded indebtedness of \$300,000 toward the erection of a Capitol; to regulate the working and inspection of coal-mines; creating Delta, Mesa, and Montrose counties from Gunnison; Eagle and Garfield counties from Summit, and Uncompahgre county from Ouray; changing the name of Uncompahgre county to Ouray, and of Ouray county to San Miguel; to enable counties to refund railroad-aid bonds; to provide for the drainage of lands for agricultural and other purposes; to regulate primary elections; to establish a State Bureau of Horticulture; and to establish an insurance department and regulate the insurance companies doing business therein.

Finances.—The reports of the Auditor and State Treasurer show that the financial affairs of the State are in a more satisfactory condition than at any previous period. These reports represent the condition of the State Treasury, Nov. 30, 1882, to be as follows:

Warrants outstanding.....	\$188,551 28
Certificates of indebtedness.....	95,187 00
Total debt.....	\$283,698 28
Deduct cash in Treasury.....	188,616 65
Indebtedness over cash in Treasury.....	\$45,071 63
Amount due State on taxes payable Jan. 1, 1883.....	\$417,762 73
Deduct outstanding indebtedness.....	45,071 63
Balance due above indebtedness.....	\$372,691 10

The above amount, representing what is due the State on taxes payable Jan. 1, 1883, does not include delinquent taxes of former years, from which a large sum will be collected.

The following is a more recent statement:

	Receipts.	Disbursements.
1858:		
April 11th, balance.....	\$292,760 11	
April.....	17,829 51	\$16,770 12
May.....	91,972 73	82,714 89
June.....	65,450 04	96,287 32
July.....	29,225 95	19,824 65
August.....	26,985 75	62,661 68
September.....	17,373 87	16,973 63
October 22d.....	9,041 11	9,516 17
		\$905,088 91
October 22d, balance.....		240,399 65
Total.....	\$545,498 56	\$545,498 56

The assessed value of property in 1881 was \$96,185,305; in 1882, \$104,440,683.

State Institutions.—The number of convicts in the Penitentiary, Nov. 30, 1878, was 146, and on the 30th of November, 1880, there were 226, being an increase of nearly 55 per cent. in the two years. The reports of the officers of the Penitentiary show that the number of convicts on the 30th of November, 1882, was 332, an increase of 42½ per cent. during the two years. In January, 1883, there were 329, of whom 86 were life-convicts. So long as there continues to be such a large accession to the number of convicts, requiring frequent enlargement of the institution for their accommodation, the Penitentiary must continue to be a burden to the tax-payers. During the last two years 114 new cells have been constructed, making, in the aggregate, cell accommodations for only 284 prisoners. The erection of a new cell-building has been begun. Several large and substantial buildings have been constructed during the two years. These buildings have all been the work of convict-labor.

The commissioners have estimated the expenses for the years 1883 and 1884 as follows:

Material for two cell buildings.....	\$50,000
Material for building for convicts under contract.....	5,000
Material for remodeling a building for State workshops.....	10,000
Appropriation to pay for land already purchased.....	2,500
Appropriation to pay for more lime-land.....	3,000
Material for gates, etc., for extension of wall.....	1,000
Maintenance and expense of prison.....	223,380
	\$304,880
Earnings estimated for two years.....	100,000
Appropriation asked.....	\$204,880

An additional building for the Mute and Blind Institute has been erected at a cost of over \$20,000. The number of inmates at the beginning of the year was 44. A new building for the Insane Asylum at Pueblo is in course of erection. When this is completed, there will be accommodation for 125 patients.

During the two years ending Nov. 30, 1882, 57 patients were received and 46 discharged, making a net gain of 11, which, added to the number on hand at the beginning of the term, 38, makes 49. The percentage of recoveries has been about 53.

The Legislature, in 1881, provided for the establishment of the State Industrial School at Golden. Its purposes were to educate and reform young persons who have fallen into the ways of crime, rather than to confine them in jails. The large number who have been sent there by the various district courts and police magistrates throughout the State, shows that the greatest necessity existed for such an institution. The report of the officers of the school shows that 81 pupils had been sent there at the close of 1882; that the terms of five had expired, and that there were then 75 pupils at the institution.

Education.—The rapid increase in population during the past two years has occasioned the organization of many new schools. About 100

new districts have been organized, and nearly as many school-houses have been erected. Many of these buildings are large, expensive structures. There are 370 school-houses in the State, valued at \$1,235,491, having seating capacity for 26,470 pupils. According to the school census of 1882, there were in the State 49,208 children between the ages of 6 and 21 years, of which number 31,738 were enrolled in the public schools. The permanent school fund of the State now amounts to \$75,200.37, being an increase during the past two years of about \$40,000. This fund is invested in interest-bearing State securities, and the interest received therefrom, together with money received from the rental of school lands, is distributed to the several counties of the State according to the school population. During the past two years \$30,604.68 of such money has been thus distributed. The State Library contains 7,107 volumes.

The university at Boulder was the first educational institution established by the Legislature. The number of students now exceeds 100, and six were graduated from the classical course of the college department in 1882.

The report of the State School of Mines shows that the number of students is more than double that of two years ago.

The agricultural interests of the State, which until recently have been overshadowed by min-

ing and other interests, are now beginning to command attention. Now the climate is understood, irrigation is practiced intelligently, and the appliances for destroying the pest of farming communities are well understood. But owing to the scarcity of water for irrigation, only a limited amount of lands can be cultivated, and Colorado can never become an agricultural State. The first State Legislature established an Agricultural College at Fort Collins. Under the economical supervision of the managers, very commendable results have been attained with the appropriations made by the State. The present value of the college property, at what is considered a low estimate, is as follows:

Buildings and farm.....	\$28,060 00
Fixtures and personal property.....	21,611 12
Total.....	\$50,671 12
The cost to the State has been.....	43,000 00

The number of students in attendance in 1881 was 62; in 1882 there were 95. The college farm, which contains 240 acres, has been fenced, irrigating-ditches have been constructed, and a portion of the land has been brought under cultivation. Some blooded stock has been procured, and many trees planted. In September, 1882, a department of mechanics and drawing was established.

Mining.—The following table gives the product of precious metals at the periods named:

YEAR.	Gold.	Silver.	Copper.	Lead.	Total.
1850-'70.....	\$27,213,081 00	\$330,000 00	\$40,000 00	\$27,583,081 00
1870.....	2,000,000 00	650,000 00	20,000 00	2,680,000 00
1871.....	2,000,000 00	1,029,046 00	30,000 00	3,019,046 00
1872.....	1,725,000 00	2,015,000 00	45,000 00	\$5,000 00	3,790,000 00
1873.....	1,750,000 00	2,135,000 00	65,000 00	23,000 00	4,028,000 00
1874.....	2,002,487 00	3,096,028 00	90,197 00	73,676 00	5,262,388 00
1875.....	2,161,475 02	3,122,912 00	90,000 00	60,000 00	5,484,387 02
1876.....	2,726,315 83	3,315,592 00	70,000 00	80,000 00	6,191,907 82
1877.....	3,148,707 56	3,726,879 83	93,796 64	247,000 00	7,216,288 53
1878.....	3,490,394 36	3,341,307 81	89,000 00	686,924 73	10,558,116 30
1879.....	3,198,500 00	15,335,000 00	582,362 00	19,110,862 00
1880.....	3,206,500 00	18,615,000 00	1,678,500 00	23,500,000 00
1881.....	22,203,508 73
1882.....	26,000,000 00
					\$166,607,575 99

The following is a condensed tabulated statement of the bullion output of Lake county and Leadville from 1860 to Jan. 1, 1883, and is as nearly correct as it is possible to make it:

FIRST PERIOD.	
1860-'70, gold from placers.....	\$6,400,000 00
1874, gold and silver.....	145,000 00
1875, gold and silver.....	113,000 00
1876, gold, silver, and lead.....	85,000 00
1877, gold, silver, and lead.....	555,380 00
1878, gold, silver, and lead.....	3,152,925 00
Total.....	\$10,451,235 00
SECOND PERIOD.	
1879, gold, silver, and lead.....	\$10,333,740 69
1880, gold, silver, and lead.....	14,187,697 00
1881, gold, silver, and lead.....	13,170,576 00
1882, gold, silver, and lead, first quarter.....	4,043,618 00
1882, gold, silver, and lead, second quarter.....	3,769,300 00
1882, gold, silver, and lead, third quarter.....	4,575,340 00
1883, gold, silver, and lead, fourth quarter (estimated).....	4,000,000 00
Total.....	\$54,083,971 69
Grand total.....	\$64,535,226 69

Coal-mining is fast becoming one of the chief industries of this State. The counties of Las Animas, Fremont, Boulder, Jefferson, Gunnison, Huerfano, El Paso, Park, and La Plata are large producers of coal. The following table will be of interest as showing the growth of the coal output of the leading mines of southern Colorado, from the time they were opened to the end of the year 1882:

	Tons.	1878.	Tons.
1878.....	12,187	1878.....	82,140
1874.....	18,092	1879.....	120,102
1875.....	15,278	1880.....	221,373
1876.....	20,316	1881.....	350,944
1877.....	44,410	1882.....	511,289

No exact figures concerning the output of the coal-mines of northern Colorado have been obtainable. It is safe to say, however, that the product of the Welch banks, at Louisville, and the Boulder valley, at Erie, have been increased 50 per cent. over 1881. The Star and

Marshall banks, as well as the South Park mines, at Como, likewise show an increase.

The Gunnison anthracite coal-fields near Crested Butte have been recently brought under development. The coal is a red-ash, free-burning anthracite, resembling most nearly the Lykens valley coal of Pennsylvania.

Agriculture and Stock-raising.—The acreage of southern Colorado was 149,509; value of products, \$2,862,595. The acreage of northern Colorado was 342,998; value, \$6,905,374.

RECAPITULATION OF AGRICULTURAL PRODUCTS FOR THE YEAR 1882.

ARTICLES.	Acreage.	Number of bushels.	Value.
Wheat.....	101,125	1,583,740 at \$0 85	\$1,303,679
Oats.....	84,951	1,088,357 at 60	649,973
Corn.....	30,475	900,068 at 55	510,050
Barley.....	10,516	261,185 at 1 00	261,185
Rye.....	4,385	73,080 at 1 10	85,888

Vegetables.....	85,000 at 60 00	2,100,000
Small fruits.....	2,500 at 150 00	377,500
Total.....	492,507	\$9,767,969

* Tons.

The extent of territory devoted to cattle-raising has become very large, and there is range enough in this State to support 1,500,000 cattle. The assessors return the number of cattle now in the State as less than 500,000, but it is not believed that these reports are correct. The following table gives the assessors' returns for a number of years:

Cattle in 1871.....	145,916	Cattle in 1880.....	541,568
Cattle in 1875.....	299,515	Cattle in 1881.....	411,970
Cattle in 1878.....	498,279	Cattle in 1882.....	423,948
Cattle in 1879.....	523,565		

But that there were in 1878-'80 more cattle than at present is doubtful. It is claimed that the vast region between the Gunnison and Grand rivers on the north, and the Uncompahgre, the Dolores, and the San Miguel on the east and south, extending 50 miles in one direction and 150 in another, and comprising nearly 5,000,000 acres, furnishes an excellent and almost unoccupied region for stock-growing. It is reached by the Denver and Rio Grande railroad, and is within driving distance from the Union Pacific.

According to estimate, 100,000 head were, in 1882, shipped out of the State, while the home consumption amounted to 60,000. The value of these is placed at above \$6,000,000.

According to the assessors' returns, there were, in 1882, 11 per cent. more sheep in Colorado than a year before. The assessors returned in 1879, 779,229; in 1880, 782,629; in 1881, 624,502; and in 1882, 706,048. It is thought that the number of sheep now in the State is over 1,000,000. Their value is estimated at \$2,500,000. It is estimated that during 1882 the wool-clip amounted to 5,000,000 pounds, worth \$1,000,000; and that 100,000 wethers, worth \$350,000, were consumed or shipped to Eastern markets—a total income from sheep of \$1,350,000.

There is considerable difference between the sheep of the southern part of the State and those of the northern part, the latter being much the better. In a division of this kind, Colorado Springs is about on the dividing line.

Railroads.—The rapid growth of the railroad system of the State is shown in the annexed table:

	Miles.		Miles.
1870.....	157	1877.....	1,045
1871.....	329	1878.....	1,165
1872.....	468	1879.....	1,208
1873.....	608	1880.....	1,581
1874.....	692	1881.....	2,208
1875.....	807	1882.....	3,068
1876.....	967		

The subjoined table shows the miles in operation at the beginning of 1883:

	Miles.
Union Pacific and branches.....	1,170
Denver and Rio Grande.....	1,931
Atchison, Topeka and Santa Fé.....	281
Burlington.....	182
Denver and New Orleans.....	184
Denver, Utah and Pacific.....	40
Total.....	3,068

Temperance.—A State Temperance Convention was held in Denver in October, which adopted a platform containing the following:

We recognize it to be the duty of every real friend of humanity and all true reform, to refrain totally from the use of alcoholic drink of every description, and that no countenance be given to its manufacture or sale by license, either high or low; and that the only proper and just way to treat such a monster evil is to prohibit it by the plainest and strongest statutes, enforced by the severest penalties, just as all other crimes are dealt with in the body politic.

Resolved, That steps should at once be taken to prepare a bill providing for an amendment to the Constitution of this State, having prohibition for its foundation, and that a committee of five be appointed by this convention to further this end.

State Capital.—At the general election in November, 1881, the city of Denver was selected as the permanent capital of the State. The litigation which has been pending for several years past concerning the title of the State to the block on Capitol hill, known as "Capitol square," has been finally determined in favor of the State by the Supreme Court of the United States.

Resources and General Condition.—Colorado, now in its twenty-fifth year, counts a settled population of 300,000, and a taxable valuation of \$110,000,000, representing an actual property value of \$200,000,000. It is traversed by nearly 3,000 miles of railroad. Its growth in importance as a grazing State becomes yearly more manifest by its largely increased shipments of live-stock, while its available farming area is being constantly added to by the rapid extension of its system of irrigating canals. Not so generally understood, however, is the vast extent of its coal and iron deposits, now in the first stage of development.

The area of the State is, in round figures, 104,000 square miles, distributed (approximately) as follows:

Agricultural lands.....	6,000,000
Pastoral lands.....	25,000,000
Mineral and timber lands.....	35,000,000

Statistics.—The mileage and assessment of railroads have been as follow :

YEAR.	Miles.	Assessed value.
1878.....	1,065-63	\$5,013,685
1879.....	1,315-60	7,637,459
1880.....	1,835-61	8,688,668
1881.....	1,534-10	11,688,065
1882.....	2,245-29	17,783,153
1883.....	2,750-76	20,146,864

The total assessed number of live-stock in the State is: Cattle, 511,940; sheep, 834,127; other stock, 110,045. Assessed value, \$12,-321,109.

It is believed that this does not represent over 50 per cent. of the stock actually within the State.

The gross product of the State from all sources, for the year 1882, was as follows :

Gold, silver, and lead bullion.....	\$24,750,800
Agriculture.....	9,175,000
Coal and coke.....	5,000,000
Iron and steel.....	4,500,000
Cattle, sheep, hides, and wool.....	5,000,000
Manufactures.....	10,000,000
Total.....	\$60,425,800

The State has no bonded debt. Its total indebtedness on Nov. 24, 1883, consisted of

Warrants outstanding.....	\$524,045
Certificates of indebtedness.....	19,386
Total.....	\$543,981

The revenue of the State for the current year (collectable January, 1884, and thereafter) will amount to \$588,125.

The annual bullion shipments for five years were:

1878, gold, silver, and lead.....	\$10,556,116
1879, gold, silver, and lead.....	19,110,862
1880, gold, silver, and lead.....	23,500,000
1881, gold, silver, and lead.....	22,908,500
1882, gold, silver, and lead.....	26,750,800

The mining products of Colorado for the year 1883 (gold, silver, copper, and lead) were:

COUNTY.	Amount.	COUNTY.	Amount.
Boulder.....	\$400,000	La Plata.....	\$123,000
Chaffee.....	800,000	Ouray.....	700,616
Custer.....	800,720	Park.....	400,000
Clear Creek.....	2,000,000	Pitkin.....	125,000
Dolores.....	200,008	Rio Grande.....	182,000
Eagle.....	930,000	Routt.....	75,000
Fremont.....	20,000	Saguache.....	100,001
Gilpin.....	2,208,930	San Miguel.....	225,000
Grand.....	10,000	San Juan.....	418,955
Gunnison.....	650,000	Summit.....	850,000
Hinsdale.....	390,000		
Lake.....	13,691,208	Total.....	\$26,806,131

The State Engineer says: "The mileage of new irrigating canals completed since June 1, 1882, and those still under construction Dec. 1, 1883, is as follows:

	Miles.
Arapahoe county.....	86
Douglas county.....	15
Larimer county.....	104
Weld county.....	185

A total of 340 miles, which it is estimated will bring under water 350,000 fresh acres. Large additions are also being made to the system in Rio Grande, Conejos, and Costilla, and canals

have been begun in the new counties of Mesa, Montrose, and Delta, all of which will greatly increase the available acreage next year."

COMMERCE AND NAVIGATION, AMERICAN. The total volume of foreign commerce in the year ending June 30, 1883, was larger than in any year in the history of the country, exceeding by about \$2,000,000 that of 1881. The total value of the exports and imports of merchandise in 1883 was \$1,547,020,316. Compared with the commerce of other countries it is only exceeded by that of Great Britain, which aggregated \$3,-497,000,000 in 1882, and that of France, where the special commerce in 1882 amounted to \$1,713,000,000; exceeding in volume that of Germany, which in 1881 amounted to \$1,480,-000,000. Including the imports and exports of specie, the total volume of the foreign commerce in 1883 was \$1,607,330,040, being less than in 1881, when it aggregated \$1,675,024,-318, and less also than in 1880, when it was \$1,613,770,633, but greater than in 1882, when it was \$1,567,071,700. In 1874 the borrowing period which followed the war came to an end, and the extension of railroads greatly facilitated the exportation of agricultural products. Since that year there has been a constant excess of exports over imports, and since 1876 a large annual excess of merchandise exports. The entire movement of foreign commerce for these ten years is shown in the following tables. The value of the total exports and imports of merchandise, with the annual excess of exports or imports, was each year as follows:

YEAR.	Exports.	Imports.	Excess of exports.
1874.....	\$536,283,040	\$767,406,342	\$18,876,698
1875.....	519,442,711	538,005,486	19,562,735*
1876.....	540,884,671	460,741,190	79,643,481
1877.....	602,475,220	451,823,126	151,152,094
1878.....	694,965,766	437,051,682	257,914,224
1879.....	710,489,441	445,777,175	264,661,666
1880.....	885,683,653	667,954,746	167,688,912
1881.....	902,377,346	642,664,628	259,712,718
1882.....	750,542,257	724,639,574	25,902,688
1883.....	823,689,402	723,180,214	100,658,488

* Excess of imports.

The annual values of domestic products exported and of foreign commodities re-exported, in the total values given above, were as follow:

YEAR.	Domestic exports.	Foreign exports.
1874.....	\$569,433,421	\$16,949,619
1875.....	499,294,100	14,153,611
1876.....	525,582,247	14,902,424
1877.....	589,870,224	12,904,996
1878.....	690,709,268	14,156,493
1879.....	693,840,790	12,098,651
1880.....	923,946,858	11,692,305
1881.....	883,925,947	18,451,399
1882.....	733,289,733	17,302,525
1883.....	804,323,632	19,615,770

The total value of gold and silver coin and bullion imported and exported, and the annual net exports or imports of specie, were as follow:

YEAR.	Exports.	Imports.	Excess of exports.
1874.....	\$66,680,435	\$28,454,908	\$38,175,499
1875.....	92,132,143	29,900,117	71,291,425
1876.....	56,506,892	15,986,651	40,520,241
1877.....	66,162,237	40,774,414	25,387,823
1878.....	88,740,125	29,821,514	58,918,611
1879.....	94,997,441	20,296,090	74,701,351
1880.....	17,142,919	93,084,310	75,941,391*
1881.....	19,406,847	110,575,497	91,168,650*
1882.....	49,417,479	42,472,390	6,945,089
1883.....	81,520,388	28,480,391	53,039,997

* Excess of imports.

The total value of exports and imports, including specie, with the annual excess of exports, was each year as follows:

YEAR.	Exports.	Imports.	Excess of exports.
1874.....	\$652,913,445	\$395,861,248	\$257,052,197
1875.....	605,574,833	583,906,153	21,668,700
1876.....	596,890,973	476,677,871	120,213,102
1877.....	658,637,457	492,097,540	166,539,917
1878.....	728,605,891	466,872,846	261,733,045
1879.....	735,436,882	466,073,775	269,363,107
1880.....	852,781,577	760,989,056	91,792,521
1881.....	921,784,198	753,240,125	168,544,073
1882.....	799,959,736	767,111,964	32,847,772
1883.....	855,659,735	751,670,305	103,989,430

Classification of Exports.—The exports of each of the general classes of domestic products in 1883, as compared with the preceding fiscal year, were as follow:

DOMESTIC EXPORTS.	1882.	1883.
Agricultural products.....	\$552,919,819	\$619,260,449
Manufactures.....	108,182,481	111,890,001
Mineral products.....	56,378,887	51,444,837
Products of the forests.....	9,188,984	9,978,143
Products of the fisheries.....	6,197,752	6,378,375
All other commodities.....	6,271,359	5,266,807
Total.....	\$738,299,732	\$804,222,639

The agricultural exports constituted 77 per cent. of the total exports of domestic produce; manufactures, 13.91 per cent.; products of the mines and petroleum, 6.40 per cent.; forestry products, 1.24 per cent.; products of the fish-

eries, 0.78 per cent.; and all other commodities, 0.67 per cent.

The increased exportation of domestic merchandise in 1883, over that of the preceding year, was due to the more abundant crops. The increased exportation of cotton and cereals not only accounts for the increment, but, with an increase in the value of manufactured products exported, makes good a large decrease in the exports of provisions, due in part to the failure of the corn-crop in 1881 and in part to the prohibition of American pork products by Continental governments; and offsets, moreover, a very considerable falling off in the value of the petroleum exports, mainly due to excessive production and a decline in price.

From the founding of the republic to the civil war, agricultural products constituted usually over 80 per cent. of the total annual exports of domestic merchandise. During the ten years, 1870-'79, they averaged about 77 per cent., the percentage which they bore in 1883. The vast exports of grain in 1880 and 1881, from superabundant crops, to supply the deficiency of the crops in Europe, brought the percentage up to 83.25 and 82.63; while in 1882, with a diminished yield in the United States and better harvests in Europe, it fell below the average, to 75.31 per cent.

The four main classes of agricultural products—breadstuffs, raw cotton, provisions, and tobacco—with mineral-oil, constitute the five leading classes of domestic exports. Cotton was for half a century or more by far the most important, until the exports of grain and provisions increased, after the great extension of railroads. In 1878 the grain exports began to exceed in value those of cotton, but in 1882, when the grain-crop had suffered more than the cotton-crop, and again in 1883, with a better grain-crop, cotton reasserted its supremacy. The annual exports of these five leading classes of domestic products in the past ten years were as follow:

YEAR.	Breadstuffs.	Cotton, raw.	Provisions.	Mineral-oil.	Tobacco, and manufactures of.
1874.....	\$161,198,864	\$211,228,580	\$78,828,990	\$41,245,815	\$32,968,598
1875.....	111,458,265	190,688,625	81,348,401	80,078,568	27,544,470
1876.....	181,181,555	193,659,263	89,881,747	82,915,786	25,570,588
1877.....	117,906,476	171,118,503	114,991,749	61,789,438	32,020,314
1878.....	181,777,341	180,061,484	123,564,209	46,574,974	28,484,489
1879.....	210,855,528	162,904,350	116,858,650	40,305,249	28,215,240
1880.....	288,096,835	211,685,905	127,048,242	86,218,625	18,442,373
1881.....	270,332,519	247,695,746	151,528,268	40,315,609	20,578,884
1882.....	182,670,523	199,812,644	190,655,701	51,282,706	21,430,869
1883.....	308,040,550	247,823,731	107,388,367	44,918,079	22,095,322

The value of the exports of products of manufacture in 1883 amounted to \$111,890,001, as against \$108,182,481 during the preceding year, and was larger than during any previous year in the history of the country, having increased from \$45,658,873 in 1860. The exports of manufactured articles constituted, however, only 2 per cent. of the total annual value of manufactures produced in the country, according to the census of 1880.

Agricultural Exports.—The following is a list of the values exported during the year ending June 30, 1883, of the principal articles of export which are products of domestic agriculture:

ARTICLES.	Value.
Cotton, unmanufactured.....	\$347,323,731
Bread and breadstuffs.....	208,040,650
Provisions.....	107,858,387
Tobacco, unmanufactured.....	19,488,066
Animals, living.....	10,759,268
Oil-cake.....	6,061,609

ARTICLES.	Value.
Hops.....	\$5,616,870
Seeds.....	4,811,919
Tallow.....	8,248,749
Hides and skins.....	1,220,158
Hair, unmanufactured.....	488,897
Lard-oil.....	858,184
Hay.....	961,614
Cotton-seed oil.....	216,779
Sugar, brown.....	148,957
Wine.....	77,280
All other agricultural products.....	4,828,651
Total.....	\$619,369,449

In the class of bread and breadstuffs, the exports of wheat amounted to \$119,879,341; wheat-flour to \$54,824,459; Indian corn to \$27,756,082; rye to \$1,657,998; maizena, farina, and similar food preparations to \$987,829; Indian-corn meal to \$980,798; bread and biscuit to \$829,281; and barley, oats, and other small grain and pulse and rye-flour, together, to \$1,125,062.

Of the live-animal exports, horned cattle represented \$8,341,431; sheep, \$1,154,856; mules, \$486,560; horses, \$475,806; hogs, \$272,516; and other animals and fowls, \$58,099.

The fruit exports comprised apples of the value of \$1,085,230; dried apples of the value of \$786,800; other fresh and dried fruit of the value of \$447,395; and canned or preserved fruit of the value of \$686,517.

Of the total value of the exports of provisions, bacon and hams represented \$38,155,952; lard, \$26,618,048; cheese, \$11,134,526; fresh beef, \$8,342,131; pork, \$8,192,268; preserved meats, \$4,578,902; salted and cured beef, \$3,742,282; butter, \$2,290,665; potatoes and other vegetables, \$694,676; and condensed milk, eggs, and fresh mutton, together, \$448,657.

Exports of Manufactures.—The following were the principal manufactured articles exported in 1883:

ARTICLES.	Value.
Wood, manufactures of.....	\$20,996,394
Iron and steel manufactures.....	19,024,584
Cotton, manufactures of.....	12,851,145
Leather, and manufactures of.....	7,928,662
Spirits of turpentine.....	4,866,229
Agricultural implements.....	3,888,919
Drugs, chemicals, and medicines.....	3,806,195
Sugar and molasses.....	3,264,531
Sewing-machines.....	3,061,989
Tobacco, manufactures of.....	2,667,168
Spirits, distilled.....	1,982,888
Cars, railroad.....	1,900,908
Carriages and carts.....	1,607,502

The articles not here enumerated which were exported to the value of over \$100,000 were stone and china ware, candles, blacking, hats and bonnets, tin and manufactures of, trunks and valises, varnish, brooms and brushes, vessels sold to foreigners, watches, volatile and essential oils, pig-iron, matches, and lime and cement.

Mineral Exports.—The following were the values of the principal articles of export in 1883, which were products of mining, including mineral-oils:

ARTICLES.	Value.
Mineral oil: Refined.....	\$40,555,499
Crude.....	8,914,941
Residuum.....	442,646
Coal: Anthracite.....	2,648,088
Bituminous.....	1,898,314
Quicksilver.....	1,030,827
Copper-ore.....	942,771
Other mining products.....	822,968
Total.....	\$51,444,557

Exports of Products of Forestry and the Fisheries.—The values of the products of forestry exported in 1883 were as follow:

ARTICLES.	Value.
Timber, sawed and hewed.....	\$2,102,229
Logs, masts, spars, etc.....	2,401,031
Other wood and timber.....	294,151
Rosin and turpentine.....	3,668,139
Tar and pitch.....	174,686
Ginseng.....	843,898
Tan-bark.....	87,528
Total.....	\$9,976,148

The values exported of the various products of the fisheries were as follow:

ARTICLES.	Value.
Oils, animal: Sperm.....	\$290,417
Whale and other fish.....	115,490
Provisions: Fish, dried or smoked.....	882,380
Fish, fresh.....	72,875
Fish, pickled.....	372,282
Fish, other cured.....	8,202,416
Oysters.....	629,686
Spermaceti.....	66,651
Whalebone.....	599,550
All other articles.....	44,129
Total.....	\$6,976,875

Of the non-classified exports of domestic merchandise, amounting to \$5,366,807, the principal items were fertilizers of the value of \$1,082,501, and furs and fur-skins of the value of \$3,985,608.

The values of the various articles imported during the year ending June 30, 1883, were as follow:

ARTICLES.	Value.
Sugar.....	\$91,589,380
Molasses, melada, etc.....	7,787,065
Wool, raw.....	10,949,881
Wool, manufactures of.....	44,374,923
Silk, raw.....	14,043,840
Silk, manufactures of.....	86,764,276
Chemicals, dyes, drugs, etc.....	49,126,285
Coffee.....	42,050,518
Iron and steel, and manufactures of.....	40,796,007
Cotton manufactures.....	38,838,689

ARTICLES.	Values.
Raw cotton.....	\$900,583
Hides and skins.....	27,640,030
Tin, and manufactures of.....	22,917,837
Linens manufactures and flax.....	19,737,549
Fruits and nuts.....	19,313,041
Tee.....	17,302,349
India-rubber, gutta-percha, and manufactures of	15,844,303
Breadstuffs and farinaceous food.....	15,590,605
Wood, and manufactures of.....	14,587,373
Leather, and manufactures of.....	13,104,415
Jute and grasses, raw and manufactured.....	12,606,513
Wines, spirits, and cordials.....	12,308,307
Tobacco, and manufactures of.....	11,771,596
Provisions, including eggs, fish, and potatoes..	10,553,373
Earthen, stone, and china ware.....	8,690,527
Fancy goods, perfumery, and cosmetics.....	8,353,471
Furs, dressed and undressed.....	7,959,759
Glass and glassware.....	7,762,545
Precious stones.....	7,692,985
Products of the United States brought back.....	6,514,999

Cocoa.....	1,213,371
Clothing.....	1,183,355
Beer, ale, and porter.....	1,122,010
Marble and stone, and manufactures of.....	1,011,363
Cork-bark and wood, unmanufactured.....	933,935
Jewelry, etc.....	912,625
Guano, except from bonded islands.....	585,743
Brass, and manufactures of.....	580,281
Boiling-cloths.....	418,711
Copper, and manufactures of.....	394,765
Barks, used for tanning.....	348,998
All other articles.....	37,334,337
Total.....	\$723,130,914

The total value of the merchandise entered for consumption, during the fiscal year 1883, was \$700,829,873, of which \$493,916,384 was dutiable and \$206,913,289 free of duty. The total amount of duty collected was \$210,637,298, which was a larger sum than was collected in any previous year, except in 1882 and 1872. The average rate of duty collected was 42.64 per cent. of the values of the dutiable merchandise and 30.05 per cent. of the values of both free and dutiable. The average *ad valorem* rate of duty collected in 1882 was 42.75 per cent.; in 1881, 43.25; in 1880, 43.56; in 1879, 44.95; in 1878, 42.81; in 1877, 42.95; in 1876, 44.80; in 1875, 40.69; in 1874, 38.61. The total value of merchandise entered for consumption in 1882 was \$716,213,948, of which \$505,491,967 was dutiable and \$210,711,981 free of duty.

Undervaluation of Imports.—American consuls in Europe report many details of a fraudulent practice of undervaluation in the declarations of the export value of dutiable merchandise brought into the United States, whereby large

sums are lost to the Treasury. For the purpose of practicing this method of evasion, the European manufacturers and wholesale dealers maintain agents in the United States, to whom all their shipments are consigned, thus depriving American merchants of their trade by closing the market to the regular importer. The protective intent of the tariff laws can in this way be defeated, for, when the American manufacturer lowers his prices, his foreign competitor need only make his fictitious invoices lower, to retain his advantage. The American agency or commission-house accounts to him for the selling price, so that the consignor sustains no loss by undervaluation. Many foreign houses refuse to furnish price-lists to American purchasers, referring them to their branch establishments in the United States, while some have specially prepared price-lists to show to American merchants. In 1883 the Treasury Department employed experts at various consulates to ascertain the wholesale market value of certain classes of merchandise. Their reports enabled appraising officers at the ports to scrutinize invoices more carefully, which in many cases led to the collection of increased duties and fines. Fictitious discounts and unusual commissions, allowances for pretended defects and imperfections, etc., are among the devices by which goods are got through the custom-house at valuations below the market price, shippers and consignees sharing in the profit. Half the profits from the large trade in silk manufactures with Switzerland are said to be derived from the evaded duties. The consul at Bradford, England, excited the animosity of the manufacturers by reporting instances of undervaluation. The consul at St. Gallen, Switzerland, was threatened with appeals to the Swiss Federal authorities or the United States Congress, against his surveillance over the private business affairs of merchants. At Crefeld, in Germany, lists of prices in dollars are presented to American purchasers of velvets, the prices being payable in New York to the agents of the associated manufacturers. The velvet manufacturers of Basle resort to the practice, which is also common elsewhere, of including in an undervalued invoice a quantity of correctly-valued goods, which the appraisers are to examine first, and then in the hurry of business to pass the lot. The invoicing of East India cashmere wool as common wool, as practiced at Liverpool, illustrates another method of evasion. Silks, aniline dyes, wool, velvets, incandescent lamps, chemicals of several kinds, silver filigree-work, ribbons, gloves, plush, seal-skins, worsted yarns, ladies' cloaks, woolen cloths, paper-hangings, varnishes, fine pottery, cotton ties and hoop-iron, and many other articles, are in the category of fraudulently invoiced imports in respect to which the consuls have particular accounts of undervaluation.

The practice is suspected to be general

throughout Europe, and is not denied by many merchants, some of them of the highest standing, who consider it legitimate thus to defraud the United States revenue, and treat it as an impertinent inquisition for consuls to obtain lists of prices and ascertain the facts of the cost of production, to be communicated to customs officials. The undervaluations range from 10 to 60 per cent.

The Treasury authorities have no remedy against the consignees, even upon evidence of undervaluation, as either civil or criminal actions must be based upon proofs of complicity in the frauds. In most cases, reappraisal is equally fruitless, and is likely to result adversely to the Government in the absence of evidence of the export values in Europe, which is carefully and systematically concealed from the knowledge of the commercial representatives of the United States.

Commercial Intercourse with Foreign Countries.—Of the total export and import trade of 1888, the share of Great Britain was 39·69 per cent.; of France, 10·13 per cent.; of Germany, 7·98 per cent.; of Cuba and the other West India islands, 7·85 per cent.; of British North America, 6·91 per cent.; of Brazil, 8·47 per cent.; of Belgium, 3·29 per cent.; of the Netherlands, 2·01 per cent.; of Mexico, 1·60 per cent.; of Spain, 1·60 per cent.; of China, 1·57 per cent.; of Italy, 1·44 per cent.; of Russia, 1·40 per cent.; of the East Indies, 1·40 per cent.; of Japan, 1·19 per cent.; of Australia, Colombia, the Hawaiian Islands, Spanish possessions other than Cuba and Porto Rico, the Argentine Republic, Guiana, and Venezuela, between one half and 1 per cent. each; of Central America,

Portugal, Hong-Kong, Uruguay, the Dutch East Indies, Denmark, Austria, Sweden and Norway, British South Africa, Turkey, Chili, and Peru, between one fifth and one half of 1 per cent.

The foregoing table gives the values of the imports of merchandise from and exports to those countries in the commerce with which, in 1888, there was a balance in favor of the United States.

The following table exhibits the commerce in 1888 with those countries the imports from which exceeded in value the merchandise exported to them from the United States:

COUNTRIES.	Imports into the United States.	Exports from the United States.	Imports in excess of exports.
	Dollars.	Dollars.	Dollars.
Cuba	65,544,534	13,103,708	50,440,831

Trade of the Principal Customs Districts.—The export and import trade of the port of New York in 1888 amounted to \$857,430,637, being 55·43 per cent. of the total value of the foreign commerce of the United States. The exports from that port were of the total value of \$361,425,361; the imports of the value of \$496,005,276. The foreign commerce of Boston amounted to \$184,908,824, or 8·72 per cent. of the total commerce of the country, the exports from there being valued at \$62,356,749 and the imports entering that port at \$72,552,075. The share of New Orleans in the total commerce was \$104,704,076, or 6·77 per cent., of which \$95,107,814 were exports and only \$9,596,762 imports. The share of San Francisco was \$90,661,950, or 5·86 per cent., divided into exports of the value of \$44,959,420 and imports of the value of \$45,702,530. Philadelphia's commerce amounted to \$71,886,300, 4·65 per cent. of the total, \$38,147,744 being exports and \$33,738,556 imports. Baltimore's share was \$69,602,530, or 4·50 per cent., of which \$55,008,361 were exports and \$14,599,179 imports. Galveston, Savannah, Charleston, and Norfolk exported \$29,629,047, \$22,818,847, \$22,573,227, and \$18,445,648, and

imported \$1,511,712, \$488,281, \$498,891, and \$186,855, their respective shares in the total foreign trade being 2·10, 1·50, 1·49, and 1·29 per cent.

The value of the imports of merchandise at interior points of the United States without appraisement at ports of first arrival was, during the last fiscal year, \$16,594,934, as against \$18,360,066 during the previous year. The total value of the direct exports from Chicago to foreign countries amounted to \$33,750,000 during the year 1882. In 1883 the exports of Chicago are reported as \$8,723,548 and the imports as \$649,090. The exports from Minneapolis, St. Louis, and other interior points which are shipped direct to foreign countries are not officially reported. From Huron, Mich., and the district of Minnesota, exports were shipped of the value of \$10,948,590 and \$7,169,185, the imports entered at those districts being \$2,906,247 and \$1,085,213; while at Oswego, N. Y., and Vermont district imports were received of the values of \$3,341,324 and \$6,194,886, the amounts of their exports being respectively \$1,465,170 and \$1,809,521. The proportional shares in the aggregate commerce of the United States in 1883 borne by those customs districts which transacted less than 1 per cent. and more than $\frac{1}{10}$ of 1 per cent. of the total were as follow: Huron, 0·90 per cent.; Oswego, 0·63; Minnesota, Minn., 0·53; Vermont, Vt., 0·51; Buffalo Creek, N. Y., 0·37; Portland, Me., 0·33; Champlain, N. Y., 0·33; Wilmington, N. C., 0·32; Detroit, Mich., 0·31; Chicago, Ill., 0·28; Willamette, Ore., 0·26; Richmond, Va., 0·22; Niagara, N. Y., 0·21; Mobile, Ala., 0·21; Miami, Ohio, 0·20; Oregon, Ore., 0·19; Oswegatchie, N. Y., 0·19; Corpus Christi, Tex., 0·18; Brazos de Santiago, Tex., 0·14; Pensacola, Fla., 0·14; Puget Sound, Wash., 0·12; Brunswick, Ga., 0·10; Yorktown, Va., 0·10.

Shipping and Navigation.—The aggregate tonnage of the American merchant marine in 1883 and the three years preceding, compared with the tonnage at quinquennial periods since 1850, was as follows:

YEAR.	Sail.	Steam.	Total.
	Tons.	Tons.	Tons.
1850.....	3,009,507	525,947	3,535,454
1855.....	4,441,716	770,285	5,212,001
1860.....	4,485,981	867,387	5,353,368
1865.....	4,029,643	1,067,189	5,096,832
1870.....	3,171,419	1,075,095	4,246,517
1875.....	2,635,064	1,166,688	3,801,752
1880.....	2,256,476	1,211,558	3,468,034
1881.....	2,792,786	1,264,998	4,057,784
1882.....	2,810,107	1,355,826	4,165,933
1883.....	2,822,298	1,418,194	4,240,492

Under sailing-vessels in the above returns are included barges and canal-boats, the tonnage of which in 1883 amounted to 435,736 tons. The shipping which constituted the mercantile marine of the United States was distributed between the foreign and coasting trades and the fisheries as follows:

	Tons.
Foreign trade.....	1,269,681
Coasting trade.....	2,883,264
Whale-fisheries.....	82,414
Cod-fisheries.....	95,088
Total.....	4,230,447

The tonnage of sailing and steam vessels built in the United States in 1883 and the three years preceding was as follows:

YEAR.	Sailing-vessels.	Steam-vessels.	Total tonnage.
1880.....	78,556	78,828	157,384
1881.....	162,888	118,070	280,958
1882.....	160,497	181,942	342,439
1883.....	168,200	107,229	275,429

There were built in 1883 33 ships, against 31 in 1882, 29 in 1881, 37 in 1879, 71 in 1877, 114 in 1875, and 28 in 1873; 2 brigs, against 2 in 1882, 3 in 1881, and 10 in 1879; 567 schooners, against 478 in 1882, 317 in 1881, 256 in 1879, 337 in 1877, 502 in 1875, and 611 in 1873; and 227 sloops, canal-boats, and barges, against 368 in 1882, 314 in 1881, 494 in 1879, 852 in 1877, 840 in 1875, and 1,221 in 1873. The number of steam-vessels constructed in 1883 was 439, 502 in 1882, 444 in 1881, 335 in 1879, 265 in 1877, 323 in 1875, and 402 in 1873. Of the total tonnage of vessels built in 1883 there were built on the seaboard 210,349 tons, against 188,083 in 1882; on the New England coast alone, 110,226 tons, against 98,965 in 1882; on the Mississippi river, 26,448 tons, against 35,817; and on the Great Lakes, 28,638 tons, against 58,369. The tonnage of iron vessels built in 1883 was 39,846, of which 2,033 tons were sailing-vessels; in 1882 40,140 tons, nearly all steam-vessels; in 1881, 28,356 tons; in 1880, 25,582 tons; in 1879, 22,008 tons; in 1878, 23,960 tons; in 1877, 5,927 tons; in 1876, 21,346 tons; in 1875, 21,632 tons; in 1874, 33,097 tons; in 1873, 26,548 tons; in 1872, 12,766 tons; in 1871, 15,479 tons; in 1870, 8,281 tons; in 1868, 4,584 tons; in 1866, 2,801 tons.

The tonnage of American and foreign vessels entered at American seaports each year, from 1864 to 1883 inclusive, was as follows:

YEAR.	American.	Foreign.	Total.
	Tons.	Tons.	Tons.
1864.....	1,655,484	2,512,047	4,167,531
1865.....	1,613,317	2,211,610	3,824,927
1866.....	1,391,453	3,117,984	4,509,437
1867.....	2,145,691	3,190,695	5,336,386
1868.....	2,468,895	3,106,326	5,575,221
1869.....	2,459,336	3,572,844	6,032,180
1870.....	2,452,228	3,817,933	6,270,161
1871.....	2,602,591	4,890,806	7,493,397
1872.....	2,554,648	5,185,340	7,739,988
1873.....	2,443,285	4,861,464	7,304,749
1874.....	2,914,949	7,094,718	10,009,665
1875.....	2,337,158	6,325,965	8,663,123
1876.....	2,227,730	6,783,124	9,010,854
1877.....	2,337,791	7,448,597	9,786,388
1878.....	2,008,437	8,331,080	10,339,517
1879.....	2,049,744	10,718,334	12,768,078
1880.....	2,140,169	12,112,160	14,252,329
1881.....	2,219,149	12,711,292	14,930,441
1882.....	2,268,290	11,683,309	13,951,599
1883.....	2,334,661	10,526,176	12,860,837

The share of each nation in the total tonnage entered at American ports in 1888, as compared with 1856, was as follows:

FLAG.	1856.	1888.	Increase.
	Tons.	Tons.	Tons.
British.....	985,886	6,775,526	5,889,640
German.....	166,887	1,124,118	957,231
Norwegian and Swedish...	90,622	694,240	603,618
Italian.....	15,077	417,728	402,651
French.....	28,935	376,890	347,955

Aggregate.....	4,464,088	13,390,857	8,956,972

* Decrease.

Of 1,190 steam-vessels, carrying 44,205,000 bushels of grain from the port of New York during the calendar year 1888, there were 786 British, carrying 29,441,951 bushels; 98 Belgian, carrying 5,734,018 bushels; and 170 German, carrying 4,249,485 bushels; the remainder carrying mostly Dutch, French, Danish, Italian, but none of them American colors. Of 166 sailing-vessels, carrying 4,252,946 bushels, only two were American ships. Out of 118,348,163 bushels carried in 1880, 68,876,584 bushels were shipped from New York by sail, but in 1888 the proportion had declined to 4,252,936 out of 48,457,945 bushels.

The American steam tonnage entering American ports in 1888 was 1,300,727 tons, against 1,356,790 in 1882, 1,240,578 in 1881, 1,195,900 in 1880, 1,118,459 in 1879, 1,092,103 in 1877, 1,141,784 in 1875, 870,192 in 1873, 836,456 in 1870, 298,311 in 1866, and 153,280 in 1864. Of the foreign tonnage 6,646,888 tons were steam in 1888, 7,163,237 in 1882, 6,391,126 in 1880, 8,142,728 in 1875, 1,680,704 in 1870, and 642,576 in 1865.

In 1856 the tonnage of American vessels entered at our seaports from foreign countries amounted to 3,194,275 tons, and constituted 71½ per cent. of the total tonnage entered; and in 1868, three years after the termination of the war, the tonnage of American vessels entered constituted 44.26 per cent. of the total tonnage entered, but of the total tonnage entered at seaports of the United States from foreign countries during the last fiscal year, 79 per cent. consisted of foreign tonnage, and only 21 per cent. of American tonnage.

The amount of American tonnage entered has exhibited but little change since 1868, but the tonnage of foreign vessels entered has increased from 3,105,826 tons in 1868 to 10,526,176 in 1888. In other words, foreign ship-owners have been able to secure the entire increase in the foreign carrying-trade of the United States, which increase has been very large. These facts show that the decadence of

American shipping is not at the present time due to incidents of the late war, but to causes which are persistent.

The iron ship, especially the iron steamer, has, to a great extent, superseded the wooden ship, and owing to certain conditions of mining, labor, skill, and capital, iron vessels can be more advantageously constructed in Europe, particularly in Great Britain, than in the United States. How small, relatively, is the iron tonnage built in the United States is shown by the fact that during the year 1882 there were 180 iron and steel sailing-vessels built in Great Britain and Ireland, the total tonnage of which was 182,340 tons, and 568 iron and steel steam-vessels built, the total tonnage of which was 520,437 tons, a total of 698 iron and steel sailing and steam vessels, the aggregate tonnage of which was 652,777 tons, or sixteen and a half times the total iron tonnage built in the United States.

The small progress made in the United States in the building of iron and steel vessels is even more strikingly exhibited by the fact that, of the 89,646 tons built in American ship-yards during the year ended June 30, 1883, 18,530 tons were for the home trade, which under the navigation laws of the United States is confined exclusively to American vessels, and only 21,116 tons for the foreign trade, which under the principles of maritime reciprocity, now prevalent among commercial nations, is free to the ships of all nations.

During the fiscal year 1883, 30 per cent. of the exports of merchandise was carried in sailing-vessels, 67 per cent. in steam-vessels, and 3 per cent. in cars and other land vehicles. Of the imports, 24 per cent. was brought in sailing-vessels, 72 per cent. in steam-vessels, and 4 per cent. by land.

During the fiscal year 21.4 per cent. of the exports from the United States of wheat and wheat-flour was from the Pacific coast. The rates of transportation by sea from Pacific coast ports to Europe were exceptionally low during the season of 1888. The current rate on the 5th of November, 1888, from San Francisco to Liverpool, was only £1 12s. 6d. per ton of 2,240 pounds. This was lower than the average monthly rate during any month since June, 1872. The reduction in the ocean freight rates from the Pacific coast to Europe prevented the expected diversion of wheat to the rail-line from California to New Orleans, to be shipped thence by vessels to European ports. The lowering of the rates by sea was the result of the low quotations of wheat in the European markets, which were due to the large stocks then on hand, and the expectation of supplies from other countries as well as from America.

The percentage of the tonnage entered at all American seaports which was entered at each of the principal ports in 1888, as compared with 1870 and 1860, was as follows:

PORTS.	1860.	1870.	1883.
New York.....	89.47	49.88	48.27
Boston.....	14.87	12.66	10.06
Baltimore.....	5.78	4.84	6.69
San Francisco.....	4.70	6.29	6.64
Philadelphia.....	8.70	4.79	6.43
New Orleans.....	12.65	7.81	5.50
Portland.....	2.80	2.80	1.25
Galveston.....	.65	.50	1.15
Savannah.....	1.35	1.87	1.05
Charleston.....	2.58	.58	1.01
Mobile.....	3.23	1.12	.51
All other ports.....	10.88	8.91	11.25
Total.....	100.00	100.00	100.00

Railroads and Transportation.—The cost of transporting grain and provisions from the interior to the seaboard is an important element in the foreign commerce of the United States. With the advantage of a level country, and under the spur of competition for such an enormous traffic, between the various trunk lines, among themselves and with alternative water-routes, the system of land-carriage in the United States has been brought to a higher degree of commercial economy and efficiency than that of any other country. The great markets of Europe are more accessible to the farmers of the Western prairies than to those of many parts of the Continent of Europe or of certain farming districts in the British Islands. Besides great reductions in the time and cost of transportation, commerce has been promoted by arrangements made by the railroad lines with one another and with ocean-steamship lines, by which merchandise can be transported over two or more connecting lines from the point of shipment to the point of delivery, without the necessity of any supervision on the part of shipper or consignee. The reduction in the cost of inland transportation has been the main cause of the increase in the value of the exports of cereals from \$84,586,278 in 1872, to \$208,040,850 in 1883, and in the value of the provision exports from \$59,696,670 to \$107,888,287. The extent of the reduction can be seen in the following tabular statement of the average freight charges per bushel of wheat from Chicago to New York by the lake, the Erie Canal, and the Hudson river; by the lake to Buffalo and thence by rail to New York city, and all the way by rail, for the calendar years from 1868 to 1882 and for the first ten months of 1883:

YEAR.	Lake and canal.	Lake and rail.	All rail.
	Cents.	Cents.	Cents.
1868.....	25.3	29.0	42.6
1869.....	24.1	25.0	35.1
1870.....	17.5	22.0	33.3
1871.....	21.6	25.0	31.0
1872.....	26.6	28.0	38.5
1873.....	19.2	26.9	33.2
1874.....	14.2	16.9	28.7
1875.....	11.4	14.6	24.1
1876.....	9.7	11.8	16.5
1877.....	7.5	15.8	20.2
1878.....	10.1	11.4	17.7
1879.....	18.0	18.3	17.3
1880.....	13.2	15.7	19.7
1881.....	8.6	10.4	14.4
1882.....	8.7	10.9	14.6
1883.....	9.16	12.0	16.1

The increase in the rates of 1883 over those of the foregoing year was due to the fact that the grain movement was much larger. The low rates in 1881 were exceptional, being due to the war of rates going on in that year between the trunk lines. The secret "special" rates at which merchandise was transported were actually much lower than the quoted average of 14.6 cents. In 1882 agreed rates were generally maintained. In 1883 the prospects of a smaller crop than in 1882 and of lower export prices caused variations from the schedule rates to be made privately by the different roads, until finally they worked somewhat more harmoniously under a reduced tariff, established by Commissioner Fink.*

CONGREGATIONALISTS. The following is a summary of the statistics of the Congregational churches in the United States as given in the "Congregational Year-Book" for 1883. It includes the additional returns received after the regular tables of the "Year-Book" were made up: Number of churches, 1,024; of ministers, 3,723; number of members, 387,387; of persons in Sunday-schools, 454,968; number of additions during the year by profession of faith, 18,552; number of baptisms, 5,323 of infants, 6,005 of adults. Of the ministers, 919 are returned as pastors and 1,607 as "acting pastors"; of the churches, 2,914 as supplied with pastors, and 1,023 as "vacant." The benevolent contributions reported by 2,994 churches amounted to \$1,383,685; the "home expenditures" of 2,256 churches were \$2,984,027. The seven theological seminaries, at Andover, Mass., Bangor, Me., Chicago, Ill., Hartford, Conn., Oberlin, O., Oakland, Cal. (Pacific), and New Haven, Conn. (Yale), returned in all 39 professors, 24 instructors and lecturers, and 272 students, with graduating classes of 25 members and 3 "resident licentiates." The Territories of Idaho and Montana are represented in the statistical tables for the first time this year—Idaho with one church of ten members, and Montana with four churches.

American Congregational Union.—The thirtieth annual meeting of the American Congregational Union was held in the city of New York, May 10th. The receipts for the year had been \$100,518. Grants amounting to \$68,658 had been voted to 150 churches in 25 States and Territories, and grants amounting to \$177,268

* The managers of the East and West trunk lines agreed in 1877, after their mutual arrangements had in every instance been disregarded, to submit to Mr. Albert Fink the task of arranging a pool or combination, apportioning a percentage of the total traffic to each road, and fixing the rate to be charged by each. He has continued to discharge the office of arbitrator and intermediary with varying success. The first agreement related to the west-bound freight, but the pooling arrangements have since been extended to almost all the business of the roads. The roads are not restricted as to the quantity of business they do, but the receipts beyond the allotted proportion are paid into the pool and divided. When the traffic is large, the railroads usually keep to their agreements, and their complicated accounts are adjusted through the office of Commissioner Fink; but, when business falls off, evasions are practiced surreptitiously, which are likely to lead to a war of rates, as in 1881, when earnings estimated to amount to \$80,000,000 were sacrificed.

had been paid to 91 churches in 23 States and Territories. The sum of \$14,404 had been contributed expressly to aid in the building of parsonages; and grants in aid of that object had been made to 14 churches.

American Home Missionary Society.—The anniversary of the American Home Missionary Society was held at Saratoga Springs, N. Y., June 5th. The receipts for the year ending April 1st had been \$370,981, which, with a balance of \$27,935 in the treasury at the beginning of the year, made the society's entire available resources \$398,916. The expenditures in payment of missionaries had been \$354,105. The whole number of ministers in the service of the society was 1,150, and by their aid 2,659 congregations and mission districts had been supplied. Three missionaries had served congregations of colored people, 16 had preached in their own language to Welsh, nine to German, and three to French congregations, while two had served Indian congregations. Two thousand and eight Sunday-schools, having 106,688 pupils, were under the special care of missionaries. Two hundred and thirty-three new schools had been formed. One hundred and one churches had been organized, and 43 churches had become self-supporting during the year; and 3,558 members had been received on profession of faith. A woman's department auxiliary to the society had been organized.

American Board.—The seventy-fourth annual meeting of the American Board of Commissioners for Foreign Missions was held at Detroit, Mich., Oct. 2d. The total receipts of the board for the year had been \$523,426, or \$61,155 more than the receipts of the previous year. From the fund bequeathed by Mr. Otis had been received also, for evangelistic enlargement, \$7,618; for educational enlargement, \$29,688; and for new missions in Africa, China, and Mexico, \$30,286; making in all, \$67,568. Adding this sum, the whole amount at the disposal of the Prudential Committee had been \$1,591,488. Four missionaries and twelve assistant missionaries had been added during the year to the force in the field, and fourteen returned missionaries, after a period of rest in the United States, had gone back to their work. The following general summary of the condition of the missions is taken from the "Annual Survey" of the board. Number of missions (West Central Africa, Zulu, Umzila, European Turkey, Western Turkey, Central Turkey, Eastern Turkey, Maratha, Madura, Ceylon, Hong-Kong, Foochow, North China, Shanse, Japan, Micronesia, Northern Mexico, Western Mexico, Spain, and Austria), 20; of stations, 80; of out-stations, 742.

Laborers employed.—Number of ordained missionaries (6 being physicians), 154; of physicians not ordained, men and women, 9; of other male assistants, 7; of other female assistants, 263; whole number of laborers sent from the United States, 433; number of native pas-

tors, 144; of native preachers and catechists, 369; of native school-teachers, 1,014; of other native helpers, 300; total of native laborers, 1,827; whole number of laborers connected with the missions, 2,260.

The Press.—Papers printed, as far as reported, 32,000,000.

The Churches.—Number of churches, 278; of church-members, as nearly as can be learned, 19,364; added during the year, 1,737; whole number from the first, as nearly as can be learned, 89,328.

Educational Department.—Number of high schools, theological seminaries, and station-classes, 58, with 2,086 pupils; of boarding-schools for girls, 40, with 1,538 pupils; of common schools, 832, with 31,016 pupils; whole number of pupils, 85,625.

The Missionaries and the Armenian Churches.—The matter of complaints which were made by the members of the churches formed among the Armenians, in the Eastern Turkey mission, against the management and administration of the affairs of the mission, received a full discussion. The subject of the complaint had been brought before the board at the meeting of the previous year, and a committee had been appointed then to inquire into it. This committee had appointed a sub-committee to visit the mission, and by conferences with the Armenian members of the churches and the missionaries to inform themselves at the original sources concerning the nature and merits of the complaints. From the various reports and documents presented it appears that the Armenians considered that their churches had in fact passed out of the stage of mission stations, and had become or were becoming fully developed churches, and they felt that the management of the mission ought to be modified in recognition of the changed conditions. They asked that they be given a general civil and secular organization to meet the requisitions of Turkish law, and a representative ecclesiastical organization; that the missionaries become ecclesiastically connected with the native churches, so as to be in fellowship with them and amenable to church discipline there; that all native institutions connected with the churches should be encouraged by pecuniary help and moral support; that a central theological seminary, equal to those in America, be established, with natives among the teachers and directors, and means be provided for the higher education of young men, cheaper than it can be obtained at Robert College; that a larger proportion of native laborers be enlisted in the departments of evangelistic, literary, and educational work, with a gradual withdrawal of missionaries; and that in the several departments of work, natives should have an equal voice with missionaries in representation on the committees and in the councils, and in discussing and voting on all questions, including those of the appropriation and disposition of funds. After hearing a series of

reports, in which the views of both sides were presented, the board resolved:

1. That in accordance with the suggestion of the visiting deputation that, as a preparation for the withdrawal in our time of its missionaries from the work among the Armenians, the board favor the admission of representatives of native churches in Turkey in conferences concerning the practical work of evangelization, education, and publication, including estimates for necessary expenses, reserving, however, to the mission, as the responsible agents of the board on the field, final action respecting the distribution of funds drawn from the treasury of the board, subject, of course, to the approval of the Prudential Committee.

2. That there is a pressing need for a large-hearted and even generous co-operation with our native brethren everywhere, its particular form and method being shaped by the circumstances of each locality, but such as may assure them of our Christian love, and fit them most speedily to assume the entire support and management of the evangelization of their respective fields.

American Missionary Association.—The thirty-seventh annual meeting of the American Missionary Association was held in Brooklyn, N. Y., October 30th. The ordinary receipts of the society for the year had been \$312,567, or \$14,983 more than those of the previous year. Further sums amounting to \$13,500 had been received toward the endowment funds of the chartered institutions of the association and the proposed Arthington mission in the region of the Upper Nile, which with \$10,918 expended upon Stone Hall, Atlanta University, made the total amount that had been at the disposal of the Executive Committee, \$387,008. In the work of rearranging and consolidating the missions of this society and other societies with which it has fraternal relations, the Mendi mission in West Africa, with its special fund and the steamer John Brown, had been transferred to the United Brethren, whose mission at Shengay is contiguous to it. The Arthington mission, with its fund, had been offered to the Board of the United Presbyterian Church of North America, which was conducting a successful mission in Egypt. That board was ready to take up the mission, and intended to establish its base of operations at Khartoum, while Mr. Arthington desired to have it pushed farther up the Nile to Fatiko. The Dakota mission of the American Board, with the exception of the Sisseton agency, which had been undertaken by the Home Board of the Presbyterian Church in the United States of America, had been received by this association. It included 4 stations, 9 schools, 5 churches, 12 missionaries, 25 teachers, one native pastor, 12 native teachers, 271 church-members, 356 pupils, and 584 Sunday-school scholars. The old mission of the association in Washington Territory had one missionary, two churches, 36 Indian and 13 white members, and two Sunday-schools, with 95 scholars. The mission to the Chinese in California returned 19 schools, with 40 teachers, 14 of whom were Chinese, and an enrollment of 2,823 pupils. One hundred and seventy-five Chinese had professed to

cease from idolatry. Work among the negroes was prosecuted in twelve of the Southern States, and in Kansas and the District of Columbia. The schools include eight chartered institutions in as many States, twelve high and normal schools, and forty-two common schools, which together reported 279 teachers and 9,640 pupils. Seventy students were pursuing a theological course, and twenty a course in law. Departments in industrial training were maintained at Charleston, S. C., Macon and Atlanta, Ga., at Fisk University, Nashville, and at Memphis, Tenn.; and at Talladega, Ala., and Tongaloo, Miss. Six new churches had been added, making the whole number of churches in the South connected with the association 89, with 5,974 members and 9,406 Sunday-school scholars. These churches had raised for church purposes, during the year, \$12,027. The Ecclesiastical Association of Mississippi, with six churches, had been added to the State bodies of this character connected with the society, making the whole number eight. They represent an average of eleven churches each.

Triennial Council of the Congregational Churches.—The fifth Triennial Council of the Congregational Churches of the United States met in Concord, N. H., October 10th. About three hundred delegates were in attendance. The Rev. Dr. Arthur Little, of Chicago, was chosen moderator. The council has no authority, but is a voluntary body, for discussion and interchange of reports and opinions in the effort to ascertain the condition and feelings of the churches, and for the purpose of making such recommendations as may seem good to it. Representations were made, with statements of their wants, of the condition of the several Congregational benevolent societies, including the American Board of Commissioners for Foreign Missions, the College and Education Society, the American Missionary Association, the American Home Mission Society, the Congregational Sunday-school and Publishing Society, the American Congregational Union, and the New West Commission. The general statistical returns showed that there had been a net gain in the denomination during the past three years of 269 churches and 5,079 members; that the additions to churches by profession averaged 12,500 annually; that the contributions for Sunday-schools during the past year had amounted to \$300,000, and the contributions for charitable objects to more than \$6,000,000, and that there were 874 more churches than there were clergymen to supply them. A committee of seven members had been appointed at the previous meeting of the council to select a commission of twenty-five persons for the purpose of framing a creed or statement of belief to be submitted to the churches for their approval. The committee reported that it had appointed the commission, and was discharged. The commission had not yet completed the preparation of a creed. A

resolution was passed urging it to complete and publish its work as speedily as practicable. A resolution was introduced advising that the term "acting pastor" and its abbreviation, "A. P.," be dropped from the nomenclature and statistics of the denomination, and that all ministers in regular connection with some association or conference of churches, or ministers who accept calls to pastorates given by a formal vote of the churches, be enrolled as pastors, and all others be enrolled with their appropriate designations. This gave way to a resolution, which was adopted, directing the secretary, in preparing the "Year-Book," to follow the designations of pastor or acting pastor, adopted in the minutes of the several State bodies. The object of the measure is to remove the distinction previously recognized between pastors who have been installed with the advice of a council and those who have not been so installed. A statement was made respecting the growth of Congregational churches in the South, showing that, while only about twenty churches had been formed among the white people of the South (outside of Missouri and the District of Columbia), nearly one hundred churches had been established among the colored people, and were organized in conferences covering the Southern States. A committee was appointed to prepare a draft of a bill for the establishment of a Bureau of Indian Education, and to press it upon the attention of Congress.

Congregationalists in Great Britain.—The "Congregational Year-Book" for 1888 gives the number of members of the Congregational churches in England and Wales as 387,619, showing a net gain during the year of 1,934. The number of churches was 3,936, and the number of ministers 3,723, of whom 918 were pastors, 1,607 acting pastors, and 1,193 not in pastoral work. The number of baptisms during the year was 5,999 of adults, and 5,322 of infants.

London Missionary Society.—The receipts of the London Missionary Society for 1882 were £127,627, and a balance in favor of the society of £539 was returned on the year's accounts. The number of missionaries in connection with the society was 166, 15 of whom were women. Reports of missionary operations were made at the anniversary in May, from China, Mongolia, India, where 5,804 pupils in schools were returned; Madagascar; South Africa, including the Cape Colony and the country north of the Orange and Vaal rivers, extending almost to the Zambesi; Central Africa, including the country of the Tanganyika lake; the West Indies, including Jamaica and British Guiana; the South Sea islands, including the Samoa and Loyalty groups; Tahiti, and a number of smaller islands; and New Guinea, where, under the direction of four European missionaries and eight teachers, natives of the Loyalty islands, remarkable progress was claimed to have been made in eight years. A deputation had been sent out to visit the mission-fields of the so-

ciety, beginning with India, and going thence to China and South Africa. Another deputation had been sent out, with a representative delegated by the Congregational Union of England and Wales for the same object, to inquire into the condition of the native churches of Jamaica and British Guiana, from which the society had been gradually withdrawing its aid, but which had asked for continued support. On the recommendation of the deputation, the directors of the society, at a time later than the anniversary meeting, adopted a plan of continued but gradually diminishing support for three years longer.

Congregational Union of England and Wales.—The meeting of the Congregational Union of England and Wales for the spring was held May 11th. The subject of lay agency was discussed, with many expressions in favor of extended lay preaching. A resolution was adopted respecting the Affirmation Bill, declaring:

That the Assembly hereby records its extreme regret at the reactionary votes by which a majority of the House of Commons has rejected the Affirmation Bill, checked the course of Liberal legislation commenced fifty years ago in the repeal of the Test and Corporation Acts, and carried still further in the Act of Roman Catholic Emancipation and the relief of Jewish disability; and at the same time expresses gratitude to the minority who were faithful to the principle of religious liberty, and especially to their venerated leader, the Prime Minister, for his exposition and defense of those principles with an eloquence so lofty and in a spirit so eminently Christian.

A scheme was adopted relative to examinations of young people on the three subjects of Scripture history and doctrine, Christian evidences, and ecclesiastical polity, and a special committee was appointed to attend to the perfection and execution of it.

The forty-fourth autumnal session of the Union was held in Sheffield, beginning October 9th. The Rev. Principal, A. M. Fairbairn, D. D., presided, and delivered the opening address, the subject of which was "Christianity in the Nineteenth Century." The committee of the Jubilee Fund reported that £100,000 sterling had been added to the fund, and it now stood at £280,000. Of it there had been promised £27,826 to the Congregational Church Aid Society; £125,000 for the liquidation of church debts; £46,781 for Congregational Church extension in London, and £1,830 to various Congregational institutions, besides £17,500 for the liquidation of the debts of the Yorkshire colleges, while £24,000 were not yet appropriated. The special committee appointed at the spring session of the Union, on the subject of the examination of young people in Scriptural knowledge, reported that it had appointed central bodies of examiners on the subjects specified in the scheme approved at that meeting, and had divided the country into eight districts, for each of which a body of eight examiners had been appointed. A report was made of the work of the "Senatus Academicus" of associated theological colleges of England and Wales, which

had been instituted four years previously for promoting a higher standard of theological attainment by means of examinations. Eight Congregational colleges and one Baptist college had entered into the arrangement, and were represented in the *Senatus* by their professors and three other delegates each. Four annual examinations had been held, at which 69 candidates had presented themselves, 57 of whom had satisfied the examiners.

Congregationalists in Australia.—The Congregational churches of Australia make returns of members as follows: In New South Wales, 48 churches, 12,995 adherents, 6,229 Sunday-school scholars; Victoria, 45 churches, 15,447 adherents, 7,370 Sunday-school scholars; South Australia, 45 churches, 9,860 adherents, 4,890 Sunday-school scholars; Queensland, 20 churches, 5,650 adherents, 2,784 Sunday-school scholars; Tasmania, 29 churches, 4,885 adherents, 2,246 Sunday-school scholars; total, 187 churches, 48,747 adherents, and 23,019 Sunday-school scholars.

The Jubilee of Congregationalism in Australia and Tasmania was celebrated by an intercolonial conference of the churches, which was held in Sydney. The establishment of a Jubilee Fund was determined upon, of \$100,000, to be applied to the payment of church debts and the foundation of a Ministers' Relief Fund. Ninety thousand dollars were subscribed to this fund during the sessions of the conference.

Congregationalism in Canada.—As early as 1758 a congregational church gathered in Halifax, N. S. The name by which it was subsequently known, Mather Church, indicates its New England origin. A large Scotch Presbyterian element eventually came into Nova Scotia, and after the revolution settlement—during which many of the old New England settlers returned to their Massachusetts home—a Presbyterian minister was called to the pastorate. Eventually, by act of Parliament, the property of Mather Church was secured to "St. Matthew's Presbyterian Church," and congregationalism lost its identity in Halifax.

The men who planted the British flag over the French forts of Acadie were very largely Massachusetts Puritans, and their chaplains generally accompanied the troops, as the French were Roman Catholics.

At present, there are in the two provinces of Nova Scotia and New Brunswick, with their population of 750,000, twenty-one Congregational churches, sixteen ministers, and an acknowledged adherence of 5,000 souls. By a bequest from Mrs. Gorham, of Liverpool, N. S., a Congregational College was established in that town, but want of sufficient means, with the burning of the college building, has caused that interest to be closed and its funds to be appropriated, as the bequest provided, for mission purposes.

In 1775 a Mr. Jones, a Welshman and a Whitefieldite, connected with the Royal Artillery,

gathered a church at St. John's, N. F., which continues to this day in active operation, and is the center of a missionary work in that island. A mission on the Labrador coast is worked from the church at St. John's. There are now one settled pastor and three ordained missionaries in Newfoundland connected with Congregationalism.

In what are known as the Eastern townships of the present province of Quebec, settlers from Massachusetts, New Hampshire, and Vermont came in, forming the nucleus of Congregationalism in that section. The first remembered church gathered on Stanstead plain in a log barn, 1798, near the site of the present church-building. The churches in this locality, though in working connection with the Canadian churches, take much of their tone from the New England brethren, representing the Congregationalism of Massachusetts rather than that of England.

In 1801 Mr. Bentom, sent to the Canadas by the London Missionary Society, established a Congregational church in the city of Quebec. No clergyman other than of the Anglican and Papal communions could lawfully baptize, marry, or officiate in a public burying-ground without license from the authorities, and the license or register was renewed annually. After receiving his register two years, Mr. Bentom was refused the third. For daring to print a pamphlet against this, he was arrested, fined £50, and imprisoned for six months. It was not till several years after that these disabilities were removed by act of Parliament. The Quebec church eventually, like that of Halifax, was merged into a Presbyterian church, though another Congregational interest was immediately started, which continued till the present time, when the Protestant exodus from Quebec has closed it for a season.

Generally speaking, Congregationalism in the present provinces of Ontario and Quebec dates from the arrival, under the auspices of the English Colonial Missionary Society, of Mr. John Roaf in Toronto, and of Dr. Henry Wilkes in Montreal, about 1886. Around these gentlemen gathered the Zion churches, which, for life, liberality, influence, and social rank, were second to none in the provinces. Zion Church, Toronto, after having "hived off" four other churches, has just erected a new building. Emanuel Church, Montreal, is virtually the old Zion of that city. In 1878, scattered throughout the provinces of Ontario and Quebec, 85 churches were reported, 67 ministers, and a membership of 4,500; in 1888 the churches numbered 90, ministers 67, and members 6,000, with two churches established in the new province of Manitoba. Most of the churches and ministers of these provinces are associated in a Union which meets annually for conference only.

There is one theological college connected with the denomination, of which the first tutor or professor was Rev. A. Lillie, D. D., whose

name must be associated with those of Dr. Wilkes and Mr. Roaf in the pioneer work of Congregationalism in the old Canadas.

Congregationalism has proved itself in Canada more powerful as a principle permeating other bodies than as a distinct organization. It can only claim, in a population of 4,250,000, a following of 27,000. Many considerations may tend toward explaining its comparatively small following in an Anglo-Saxon colony, seeing that it is truly the preponderating power in English nonconformity, and has a large place in the churches of the United States. Scotch emigration (700,000 in Canada claim Scottish descent) would represent Presbyterianism, English emigration the Anglican and Methodist churches; the well-to-do class, representing English independence, having hitherto supplied little toward the stream of emigration. Consequent on this, the few who did emigrate would seldom find churches of their own order, and finding no overshadowing establishment in this land of liberty, would, with their catholic spirit, find a home in sister denominations.

CONGRESS, UNITED STATES. The second session of the Forty-seventh Congress began on Monday, Dec. 4, 1882; and the second annual message of the President was submitted, as follows:

To the Senate and House of Representatives of the United States:

It is provided by the Constitution that the President shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient.

In reviewing the events of the year which has elapsed since the commencement of your sessions, I first call your attention to the gratifying condition of our foreign affairs. Our intercourse with other powers has continued to be of the most friendly character.

Such slight differences as have arisen during the year have been already settled or are likely to reach an early adjustment. The arrest of citizens of the United States in Ireland under recent laws which owe their origin to the disturbed condition of that country has led to a somewhat extended correspondence with the Government of Great Britain. A disposition to respect our rights has been practically manifested by the release of the arrested parties.

The claim of this nation in regard to the supervision and control of any interoceanic canal across the American Isthmus has continued to be the subject of conference.

It is likely that time will be more powerful than discussion in removing the divergence between the two nations, whose friendship is so closely cemented by the intimacy of their relation and the community of their interests.

Our long-established friendliness with Russia has remained unshaken. It has prompted me to proffer the earnest counsels of this Government that measures be adopted for suppressing the proscription which the Hebrew race in that country has lately suffered. It has not transpired that any American citizen has been subjected to arrest or injury, but our courteous remonstrance has nevertheless been courteously received. There is reason to believe that the time is not far distant when Russia will be able to secure toleration to all faiths within her borders.

At an international convention held at Paris in 1880, and attended by representatives of the United States, an agreement was reached in respect to the protection

of trade-marks, patented articles, and the rights of manufacturing firms and corporations. The formulating into treaties of the recommendations thus adopted is receiving the attention which it merits.

The protection of submarine cables is a subject now under consideration by an international conference at Paris. Believing that it is clearly the true policy of this Government to favor the neutralization of this means of intercourse, I requested our minister to France to attend the convention as a delegate. I also designated two of our eminent scientists to attend as our representatives at the meeting of an international committee at Paris, for considering the adoption of a common unit to measure electric force.

In view of the frequent occurrence of conferences for the consideration of important matters of common interest to civilized nations, I respectfully suggest that the Executive be invested by Congress with discretionary powers to send delegates to such conventions, and that provision be made to defray the expenses incident thereto.

The difference between the United States and Spain as to the effect of a judgment and certificate of naturalization has not yet been adjusted; but it is hoped and believed that negotiations now in progress will result in the establishment of the position which seems to this Government so reasonable and just.

I have already called the attention of Congress to the fact that in the ports of Spain and its colonies onerous fines have lately been imposed upon vessels of the United States for trivial technical offenses against local regulations. Efforts for the abatement of these exactions have thus far proved unsuccessful.

I regret to inform you also that the fees demanded by Spanish consuls in American ports are in some cases so large, when compared with the value of the cargo, as to amount in effect to a considerable export duty, and that our remonstrances in this regard have not as yet received the attention which they seem to deserve.

The German Government has invited the United States to participate in an international exhibition of domestic cattle to be held at Hamburg in July, 1883. If this country is to be represented, it is important that in the early days of this session Congress should make a suitable appropriation for that purpose.

The death of Mr. Marsh, our late minister to Italy, has evoked from that Government expressions of profound respect for his exalted character and for his honorable career in the diplomatic service of his country. The Italian Government has raised a question as to the propriety of recognizing in his dual capacity the representative of this country recently accredited both as secretary of legation and as consul-general at Rome. He has been received as secretary, but his *acquitur* as consul-general has thus far been withheld.

The extradition convention with Belgium, which has been in operation since 1874, has been lately supplanted by another. The Senate has signified its approval, and ratifications have been duly exchanged between the contracting countries. To the list of extraditable crimes has been added that of the assassination or attempted assassination of the chief of the state.

Negotiations have been opened with Switzerland looking to a settlement by treaty of the question whether its citizens can renounce their allegiance and become citizens of the United States without obtaining the consent of the Swiss Government.

I am glad to inform you that the immigration of paupers and criminals from certain of the cantons of Switzerland has substantially ceased and is no longer sanctioned by the authorities.

The consideration of this subject prompts the suggestion that the act of Aug. 3, 1883, which has for its object the return of foreign convicts to their own country, should be so modified as not to be open to the interpretation that it affects the extradition of criminals on preferred charges of crime.

The Ottoman Porte has not yet assented to the interpretation which this Government has put upon the treaty of 1830 relative to its jurisdictional rights in Turkey. It may well be, however, that this difference will be adjusted by a general revision of the system of jurisdiction of the United States in the countries of the East—a subject to which your attention has been already called by the Secretary of State.

In the interest of justice toward China and Japan, I trust that the question of the return of the indemnity fund to the governments of those countries will reach at the present session the satisfactory solution which I have already recommended, and which has recently been foreshadowed by congressional discussion.

The treaty lately concluded with Corea awaits the action of the Senate.

During the late disturbance in Egypt the timely presence of American vessels served as a protection to the persons and property of many of our own citizens and of citizens of other countries, whose governments have expressed their thanks for this assistance.

The recent legislation restricting immigration of laborers from China has given rise to the question whether Chinese proceeding to or from another country may lawfully pass through our own.

Construing the act of May 6, 1882, in connection with the treaty of Nov. 7, 1880, the restriction would seem to be limited to Chinese immigrants coming to the United States as laborers, and would not forbid a mere transit across our territory. I ask the attention of Congress to the subject for such action, if any, as may be deemed advisable.

This Government has recently had occasion to manifest its interest in the Republic of Liberia by seeking to aid the amicable settlement of the boundary dispute now pending between that republic and the British possession of Sierra Leone.

The reciprocity treaty with Hawaii will become terminable after Sept. 9, 1883, on twelve months' notice by either party. While certain provisions of that compact may have proved onerous, its existence has fostered commercial relations which it is important to preserve. I suggest, therefore, that early consideration be given to such modifications of the treaty as seem to be demanded by the interests of our people.

In view of our increasing trade with both Hayti and Santo Domingo, I advise that provision be made for diplomatic intercourse with the latter by enlarging the scope of the mission at Port-au-Prince.

I regret that certain claims of American citizens against the Government of Hayti have thus far been urged unavailingly.

A recent agreement with Mexico provides for the crossing of the frontier by the armed forces of either country in pursuit of hostile Indians. In my message of last year I called attention to the prevalent lawlessness upon the borders and to the necessity of legislation for its suppression. I again invite the attention of Congress to the subject.

A partial relief from these mischiefs has been sought in a convention, which now awaits the approval of the Senate, as does also another touching the establishment of the international boundary between the United States and Mexico. If the latter is ratified, the action of Congress will be required for establishing suitable commissions of survey. The boundary dispute between Mexico and Guatemala, which led this Government to proffer its friendly counsels to both parties, has been amicably settled.

No change has occurred in our relations with Venezuela. I again invoke your action in the matter of the pending awards against that republic to which reference was made by a special message from the Executive at your last session.

An invitation has been received from the Government of Venezuela to send representatives in July, 1883, to Caracas, for participating in the centen-

nial celebration of the birth of Bolivar, the founder of South American independence. In connection with this event it is designed to commence the erection at Caracas of a statue of Washington, and to conduct an industrial exhibition, which will be open to American products. I recommend that the United States be represented, and that suitable provision be made therefor.

The elevation of the grade of our mission in Central America to the phenipontary rank, which was authorized by Congress at its late session, has been since effected.

The war between Peru and Bolivia on the one side and Chili on the other began more than three years ago. On the occupation by Chili, in 1880, of all the littoral territory of Bolivia, negotiations for peace were conducted under the direction of the United States. The allies refused to concede any territory, but Chili has since become master of the whole coast of both countries and of the capital of Peru. A year since, as you have already been advised by correspondence transmitted to you in January last, this Government sent a special mission to the belligerent powers to express the hope that Chili would be disposed to accept a money indemnity for the expenses of the war, and to relinquish her demand for a portion of the territory of her antagonist.

This recommendation, which Chili declined to follow, this Government did not assume to enforce; nor can it be enforced without resort to measures which would be in keeping neither with the temper of our people nor with the spirit of our institutions.

The power of Peru no longer extends over its whole territory, and in the event of our interference to dictate peace would need to be supplemented by the armies and navies of the United States. Such interference would almost inevitably lead to the establishment of a protectorate—a result utterly at odds with our past policy, injurious to our present interests, and full of embarrassments for the future.

For effecting the termination of hostilities upon terms at once just to the victorious nation and generous to its adversaries, this Government has spared no efforts save such as might involve the complications which I have indicated.

It is greatly to be deplored that Chili seems resolved to exact such rigorous conditions of peace and indisposed to submit to arbitration the terms of an amicable settlement. No peace is likely to be lasting that is not sufficiently equitable and just to command the approval of other nations.

About a year since, invitations were extended to the nations of this continent to send representatives to a peace congress to assemble at Washington in November, 1882. The time of meeting was fixed at a period then remote, in the hope, as the invitation itself declared, that in the mean time the disturbances between the South American republics would be adjusted. As that expectation seemed unlikely to be realized, I asked in April last for an expression of opinion from the two Houses of Congress as to the advisability of holding the proposed convention at the time appointed. This action was prompted in part by doubts which mature reflection had suggested whether the diplomatic usage and traditions of the Government did not make it fitting that the Executive should consult the representatives of the people before pursuing a line of policy somewhat novel in its character, and far-reaching in its possible consequences. In view of the fact that no action was taken by Congress in the premises and that no provision had been made for necessary expenses, I subsequently decided to postpone the convocation, and so notified the several governments which had been invited to attend.

I am unwilling to dismiss this subject without assuring you of my support of any measures the wisdom of Congress may devise for the promotion of peace on this continent and throughout the world, and I trust that the time is nigh when, with the universal assent

of civilized peoples, all international differences shall be determined without resort to arms by the benignant processes of arbitration.

Changes have occurred in the diplomatic representation of several foreign powers during the past year. New ministers from the Argentine Republic, Austria-Hungary, Brazil, Chili, China, France, Japan, Mexico, the Netherlands, and Russia, have presented their credentials. The missions of Denmark and Venezuela at this capital have been raised in grade. Switzerland has created a plenipotentiary mission to this Government, and an embassy from Madagascar and a minister from Siam will shortly arrive.

Our diplomatic intercourse has been enlarged by the establishment of relations with the new kingdom of Servia, by the creation of a mission to Siam, and by the restoration of the mission to Greece. The Shah of Persia has expressed his gratification that a *chargé d'affaires* will shortly be sent to that country, where the rights of our citizens have been hitherto courteously guarded by the representatives of Great Britain.

I renew my recommendation of such legislation as will place the United States in harmony with other maritime powers with respect to the international rules for the prevention of collisions at sea.

In conformity with your joint resolution of the 3d of August last, I have directed the Secretary of State to address foreign governments in respect to a proposed conference for considering the subject of the universal adoption of a common prime meridian to be used in the reckoning of longitude and in the regulation of time throughout the civilized world. Their replies will, in due time, be laid before you.

An agreement was reached at Paris in 1875 between the principal powers for the interchange of official publications through the medium of their respective foreign departments.

The admirable system which has been built up by the enterprise of the Smithsonian Institution affords a practical basis for our co-operation in this scheme, and an arrangement has been effected by which that institution will perform the necessary labor, under the direction of the Department of State. A reasonable compensation therefor should be provided by law.

A clause in the act making appropriations for the diplomatic and consular service contemplates the reorganization of both branches of such service on a salaried basis, leaving fees to inure to the benefit of the Treasury. I cordially favor such a project, as likely to correct abuses in the present system. The Secretary of State will present to you at an early day a plan for such reorganization.

A full and interesting exhibit of the operations of the Treasury Department is afforded by the report of the Secretaries.

It appears that the ordinary revenues from all sources for the fiscal year ended June 30, 1882, were as follow:

From customs	\$220,410,780 25
From internal revenue	146,497,595 45
From sales of public lands	4,758,140 87
From tax on circulation and deposits of national banks	8,966,794 45
From repayment of interest by Pacific railway companies	840,554 87
From sinking fund for Pacific railway companies	796,271 49
From customs fees, fines, penalties, etc.	1,343,848 00
From fees—consular, letters patent, and lands.	2,683,990 97
From proceeds of sales of Government property	314,950 85
From profits on coinage, bullion deposits, and assays	4,116,698 73
From Indian trust funds	5,705,249 92
From deposits by individuals for surveying public lands	2,052,806 86
From revenues of the District of Columbia ..	1,715,176 41
From miscellaneous sources	8,888,445 48
Total ordinary receipts	\$408,525,250 28

The ordinary expenditures for the same period were—

For civil expenses	\$18,042,886 49
For foreign intercourse	1,307,588 19
For Indians	9,786,747 40
For pensions	61,845,198 95
For the military establishment, including river and harbor improvements and arsenals.	48,570,494 19
For the naval establishment, including vessels, machinery, and improvements at navy-yards	15,082,046 26
For miscellaneous expenditures, including public buildings, light-houses, and collecting the revenue	84,589,287 50
For expenditures on account of the District of Columbia ..	8,380,548 87
For interest on the public debt	71,077,206 79
Total ordinary expenditures	\$257,981,489 57

Leaving a surplus revenue of

Which, with an amount drawn from the cash balance in the Treasury of	\$145,548,810 71
.....	90,737,694 84

Making

.....	\$166,281,505 55
--------------	-------------------------

was applied to the redemption of—

Bonds for the sinking fund	\$60,079,150 00
Fractional currency for the sinking fund	58,705 55
Loan of July and August, 1861	63,573,050 00
Loan of March, 1863	4,472,900 00
Funded loan of 1861	37,194,450 00
Loan of 1858	1,000 00
Loan of February, 1861	868,000 00
Five-twentieths of 1862	2,100 00
Five-twentieths of 1864	7,400 00
Five-twentieths of 1865	6,500 00
Ten-forties of 1864	254,550 00
Consols of 1865	86,450 00
Consols of 1867	408,250 00
Consols of 1868	141,400 00
Oregon war debt	675,250 00
Old demand, compound-interest, and other notes	18,350 00
Total	\$166,281,505 55

The foreign commerce of the United States during the last fiscal year, including imports and exports of merchandise and specie, was as follows:

EXPORTS.	
Merchandise	\$750,542,857
Specie	49,417,479
Total	\$799,959,786
IMPORTS.	
Merchandise	\$724,689,574
Specie	42,472,880
Total	\$767,111,954

Excess of exports over imports of merchandise, \$25,902,688.

This excess is less than it has been before for any of the previous six years, as appears by the following table:

		Excess of exports over imports of merchandise.
YEAR ENDED JUNE 30—		
1876		\$79,648,481
1877		151,152,094
1878		257,814,284
1879		264,661,666
1880		167,683,912
1881		259,712,718
1882		25,902,688

During the year there have been organized 171 national banks, and of those institutions there are now in operation 2,269, a larger number than ever before. The value of their notes in active circulation on July 1, 1882, was \$324,656,458.

I commend to your attention the Secretary's views in respect to the likelihood of a serious contraction of this circulation, and to the modes by which that result may, in his judgment, be averted.

In respect to the coinage of silver dollars and the retirement of silver certificates I have seen nothing to alter but much to confirm the sentiments to which I gave expression last year.

A comparison between the respective amounts of silver-dollar circulation on Nov. 1, 1881, and on Nov. 1, 1882, shows a slight increase of a million and a half of dollars. But during the interval there had been in the whole number coined an increase of twenty-six millions. Of the one hundred and twenty-eight millions thus far minted, little more than thirty-five millions are in circulation. The mass of accumulated coin has grown so great that the vault-room at present available for storage is scarcely sufficient to contain it. It is not apparent why it is desirable to continue this coinage, now so enormously in excess of the public demand.

As to the silver certificates, in addition to the grounds which seemed last year to justify their retirement may be mentioned the effect which is likely to ensue from the supply of gold certificates for whose issuance Congress recently made provision, and which are now in active circulation.

You can not fail to note with interest the discussion by the Secretary as to the necessity of providing by legislation some mode of freeing the Treasury of an excess of assets in the event that Congress fails to reach an early agreement for the reduction of taxation.

I heartily approve the Secretary's recommendation of immediate and extensive reductions in the annual revenues of the Government.

It will be remembered that I urged upon the attention of Congress at its last session the importance of relieving the industry and enterprise of the country from the pressure of unnecessary taxation. It is one of the truest maxims of political economy that all taxes are burdensome, however wisely and prudently imposed. And though there have always been among our people wide differences of sentiment as to the best methods of raising the national revenues, and indeed as to the principles upon which taxation should be based, there has been substantial accord in the doctrine that only such taxes ought to be levied as are necessary for a wise and economical administration of the Government. Of late the public revenues have far exceeded that limit, and unless checked by appropriate legislation such excess will continue to increase from year to year. For the fiscal year ended June 30, 1881, the surplus revenue amounted to \$100,000,000; for the fiscal year ended on the 30th of June last the surplus was more than one hundred and forty-five millions.

The report of the Secretary shows what disposition has been made of these moneys. They have not only answered the requirements of the sinking fund, but have afforded a large balance applicable to other reductions of the public debt.

But I renew the expression of my conviction that such rapid extinguishment of the national indebtedness as is now taking place is by no means a cause for congratulation; it is a cause rather for serious apprehension.

If it continues, it must speedily be followed by one of the evil results so clearly set forth in the report of the Secretary.

Either the surplus must lie idle in the Treasury or the Government will be forced to buy at market rates its bonds not then redeemable, and which, under such circumstances, can not fail to command an enormous premium, or the swollen revenues will be devoted to extravagant expenditure, which, as experience has taught, is ever the bane of an overflowing treasury.

It was made apparent in the course of the animated discussions which this question aroused at the last session of Congress that the policy of diminishing the revenue by reducing taxation commanded the general approval of the members of both Houses.

I regret that because of conflicting views as to the best methods by which that policy should be made operative none of its benefits have as yet been reaped.

In fulfillment of what I deem my constitutional

duty, but with little hope that I can make valuable contribution to this vexed question, I shall proceed to intimate briefly my own views in relation to it.

Upon the showing of our financial condition at the close of the last fiscal year I felt justified in recommending to Congress the abolition of all internal-revenue taxes except those upon tobacco in its various forms and upon distilled spirits and fermented liquors, and except also the special tax upon the manufacturers of and dealers in such articles.

I venture now to suggest that unless it shall be ascertained that the probable expenditures of the Government for the coming year have been underestimated, all internal taxes, save those which relate to distilled spirits, can be prudently abrogated.

Such a course, if accompanied by a simplification of the machinery of collection, which would then be easy of accomplishment, might reasonably be expected to result in diminishing the cost of such collection by at least two millions and a half of dollars, and in the retirement from office of from 1,500 to 2,000 persons.

The system of excise duties has never commended itself to the favor of the American people, and has never been resorted to except for supplying deficiencies in the Treasury when, by reason of special exigencies, the duties on imports have proved inadequate for the needs of the Government. The sentiment of the country doubtless demands that the present excise tax shall be abolished as soon as such a course can be safely pursued.

It seems to me, however, that, for various reasons, so sweeping a measure as the total abolition of internal taxes would for the present be an unwise step.

Two of these reasons are deserving of special mention:

First, it is by no means clear that even if the existing system of duties on imports is continued without modification, those duties alone will yield sufficient revenue for all the needs of the Government. It is estimated that one hundred millions of dollars will be required for pensions during the coming year, and it may well be doubted whether the maximum annual demand for that object has yet been reached. Uncertainty upon this question would alone justify, in my judgment, the retention for the present of that portion of the system of internal revenue which is least objectionable to the people.

Second, a total abolition of excise taxes would almost inevitably prove a serious if not an insurmountable obstacle to a thorough revision of the tariff and to any considerable reduction in import duties.

The present tariff system is in many respects unjust. It makes unequal distributions both of its burdens and its benefits. This fact was practically recognized by a majority of each House of Congress in the passage of the act creating the Tariff Commission. The report of that commission will be placed before you at the beginning of this session, and will, I trust, afford you such information as to the condition and prospects of the various commercial, agricultural, manufacturing, mining, and other interests of the country, and contain such suggestions for statutory revision, as will practically aid your action upon this important subject.

The revenue from customs for the fiscal year ended June 30, 1879, amounted to \$137,000,000.

It has in the three succeeding years reached, first, \$186,000,000, then \$198,000,000, and finally, as has been already stated, \$220,000,000.

The income from this source for the fiscal year which will end on June 30, 1883, will doubtless be considerably in excess of the sum last mentioned.

If the tax on domestic spirits is to be retained, it is plain, therefore, that large reductions from the customs revenues are entirely feasible. While recommending this reduction, I am far from advising the abandonment of the policy of so discriminating in the adjustment of details as to afford aid and protection to domestic labor. But the present system should be so

revised as to equalize the public burden among all classes and occupations and bring it into closer harmony with the present needs of industry.

Without entering into minute detail, which under present circumstances is quite unnecessary, I recommend an enlargement of the free list so as to include within it the numerous articles which yield considerable revenue, a simplification of the complex and inconsistent schedule of duties upon certain manufactures, practically those of cotton, iron, and steel, and a substantial reduction of the duties upon those articles, and upon sugar, molasses, silk, wool, and woolen goods.

If a general revision of the tariff shall be found to be impracticable at this session, I express the hope that at least some of the more conspicuous inequalities of the present law may be corrected before your final adjournment. One of them is specially referred to by the Secretary. In view of a recent decision of the Supreme Court, the necessity of amending the law by which the Dutch standard of color is adopted as the test of the saccharine strength of sugars is too obvious to require comment.

From the report of the Secretary of War it appears that the only outbreaks of Indians during the past year occurred in Arizona and in the southwestern part of New Mexico. They were promptly quelled, and the quiet which has prevailed in all other parts of the country has permitted such an addition to be made to the military force in the region endangered by the Apaches that there is little reason to apprehend trouble in the future.

Those parts of the Secretary's reports which relate to our sea-coast defenses and their armament suggest the gravest reflections. Our existing fortifications are notoriously inadequate to the defense of the great harbors and cities for whose protection they were built.

The question of providing an armament suited to our present necessities has been the subject of consideration by a board, whose report was transmitted to Congress at the last session. Pending the consideration of that report, the War Department has taken no steps for the manufacture or conversion of any heavy cannon, but the Secretary expresses the hope that authority and means to begin that important work will be soon provided. I invite the attention of Congress to the propriety of making more adequate provision for arming and equipping the militia than is afforded by the act of 1808, which is still upon the statute-book. The matter has already been the subject of discussion in the Senate, and a bill which seeks to supply the deficiencies of existing laws is now upon its calendar.

The Secretary of War calls attention to an embarrassment growing out of the recent act of Congress making the retirement of officers of the army compulsory at the age of sixty-four. The act of 1878 is still in force, which limits to four hundred the number of those who can be retired for disability or upon their own application. The two acts, when construed together, seem to forbid the relieving, even for absolute incapacity, of officers who do not fall within the purview of the latter statute, save at such times as there chance to be less than four hundred names on the retired list. There are now four hundred and twenty. It is not likely that Congress intended this result, and I concur with the Secretary that the law ought to be amended.

The grounds that impelled me to withhold my signature from the bill entitled "An act making appropriations for the construction, repair, and preservation of certain works on rivers and harbors," which became a law near the close of your last session, prompt me to express the hope that no similar measure will be deemed necessary during the present session of Congress. Indeed, such a measure would now be open to a serious objection in addition to that which was lately urged upon your attention. I am informed by the Secretary of War that the greater portion of the

sum appropriated for the various items specified in that act remains unexpended.

Of the new works which it authorized, expenses have been incurred upon two only, for which the total appropriation was \$310,000. The present available balance is disclosed by the following table:

Amount of appropriation by act of Aug. 2, 1882 ..	\$18,788,875
Amount of appropriation by act of June 19, 1882 ..	10,000
Amount of appropriation for payments to J. B. Eads	804,000
Unexpended balance of former appropriations ..	4,783,268

Total	\$28,791,188
Less amount drawn from Treasury between July 1, 1882, and Nov. 30, 1882	4,056,194

Total	\$17,734,944
-------------	--------------

It is apparent by this exhibit that so far as concerns most of the items to which the act of Aug. 2, 1882, relates there can be no need of further appropriations until after the close of the present session. If, however, any action should seem to be necessary in respect to particular objects, it will be entirely feasible to provide for those objects by appropriate legislation. It is possible, for example, that a delay until the assembling of the next Congress to make additional provision for the Mississippi river improvements might be attended with serious consequences. If such appear to be the case, a just bill relating to that subject would command my approval.

This leads me to offer a suggestion which I trust will commend itself to the wisdom of Congress. Is it not advisable that grants of considerable sums of money for diverse and independent schemes of internal improvement should be made the subjects of separate and distinct legislative enactments? It will scarcely be gainsaid, even by those who favor the most liberal expenditures for such purposes as are sought to be accomplished by what is commonly called the river and harbor bill, that the practice of grouping in such a bill appropriations for a great diversity of objects, widely separated, either in their nature or in the locality with which they are concerned, or in both, is one which is much to be deprecated unless it is irremediable. It inevitably tends to secure the success of the bill as a whole, though many of the items if separately considered could scarcely fail of rejection. By the adoption of the course I have recommended, every member of Congress, whenever opportunity should arise for giving his influence and vote for meritorious appropriations, would be enabled so to do without being called upon to sanction others undeserving his approval. So also would the Executive be afforded thereby full opportunity to exercise his constitutional prerogative of opposing whatever appropriations seemed to him objectionable, without imperiling the success of others which commended themselves to his judgment.

It may be urged in opposition to these suggestions that the number of works of internal improvement which are justly entitled to governmental aid is so great as to render impracticable separate appropriation bills therefor, or even for such comparatively limited number as make disposition of large sums of money. This objection may be well founded, and whether it be or not, the advantages which would be likely to ensue from the adoption of the course I have recommended may perhaps be more effectually attained by another, which I respectfully submit to Congress as an alternative proposition.

It is provided by the constitutions of fourteen of our States that the Executive may disapprove any item or items of a bill appropriating money; whereupon the part of the bill approved shall be law, and the part disapproved shall fail to become law, unless repassed according to the provisions prescribed for the passage of bills over the veto of the Executive. The States wherein some such provision as the foregoing is a part of the fundamental law are Alabama, California, Colorado, Florida, Georgia, Louisiana, Minnesota, Missouri, Nebraska, New Jersey, New

York, Pennsylvania, Texas, and West Virginia. I commend to your careful consideration the question whether an amendment of the Federal Constitution in the particular indicated would not afford the best remedy for what is often grave embarrassment both to members of Congress and to the Executive, and is sometimes a serious public mischief.

The report of the Secretary of the Navy states the movements of the various squadrons during the year, in home and foreign waters, where our officers and seamen, with such ships as we possess, have continued to illustrate the high character and excellent discipline of the naval organization.

On the 21st of December, 1881, information was received that the exploring steamer *Jeannette* had been crushed and abandoned in the Arctic ocean. The officers and crew, after a journey over the ice, embarked in three boats for the coast of Siberia. One of the parties, under the command of Chief-Engineer George W. Melville, reached the land, and, falling in with the natives, was saved. Another, under Lieut.-Commander De Long, landed in a barren region near the mouth of the Lena river. After six weeks had elapsed all but two of the number had died from fatigue and starvation. No tidings have been received from the party in the third boat, under the command of Lieut. Chipp, but a long and fruitless investigation leaves little doubt that all its members perished at sea. As a slight tribute to their heroism I give in this communication the names of the gallant men who sacrificed their lives on this expedition: Lieut.-Commander George W. De Long, Surgeon James M. Ambler, Jerome J. Collins, Hans Halmer Erichsen, Heinrich H. Kaacke, George W. Boyd, Walter Lee, Adolph Dressler, Carl A. Görtz, Nels Iverson, the cook Ah Sam, and the Indian Alexy. The officers and men in the missing boat were Lieut. Charles W. Chipp, commanding; William Dunbar, Alfred Sweetman, Walter Sharvell, Albert C. Kuehne, Edward Star, Henry D. Warren, and Peter E. Johnson.

Lieut. Giles B. Harber and Master William H. Scheutze are now bringing home the remains of Lieut. De Long and his comrades, in pursuance of the directions of Congress.

The *Rodgers*, fitted out for the relief of the *Jeannette*, in accordance with the act of Congress of March 8, 1881, sailed from San Francisco June 16th, under the command of Lieut. Robert M. Berry. On November 8th she was accidentally destroyed by fire, while in winter quarters in St. Lawrence bay, but the officers and crew succeeded in escaping to the shore. Lieut. Berry and one of his officers, after making a search for the *Jeannette* along the coast of Siberia, fell in with Chief-Engineer Melville's party, and returned home by way of Europe. The other officers and the crew of the *Rodgers* were brought from St. Lawrence bay by the whaling-steamer *North Star*. Master Charles F. Putnam, who had been placed in charge of a depot of supplies at Cape Serdze, returning to his post from St. Lawrence bay across the ice in a blinding snow-storm, was carried out to sea and lost, notwithstanding all efforts to rescue him.

It appears, by the Secretary's report, that the available naval force of the United States consists of thirty-seven cruisers, fourteen single-turreted monitors, built during the rebellion, a large number of smooth-bore guns and Parrott rifles, and eighty-seven rifled cannon.

The cruising-vessels should be gradually replaced by iron or steel ships, the monitors by modern armored vessels, and the armament by high-power rifled guns.

The reconstruction of our navy, which was recommended in my last message, was begun by Congress authorizing, in its recent act, the construction of two large, unarmored steel vessels of the character recommended by the late naval advisory board, and subject to the final approval of a new advisory board to be organized as provided by that act. I call your attention to the recommendation of the Secretary and the

board that authority be given to construct two more cruisers of smaller dimensions, and one fleet dispatch-vessel, and that appropriations be made for high-power rifled cannon, for the torpedo service, and for other harbor defenses.

Pending the consideration by Congress of the policy to be hereafter adopted in conducting the eight large navy-yards and their expensive establishments, the Secretary advocates the reduction of expenditures therefor to the lowest possible amounts.

For the purpose of affording the officers and seamen of the navy opportunities for exercise and discipline in their profession, under appropriate control and direction, the Secretary advises that the Light-House Service and Coast Survey be transferred, as now organized, from the Treasury to the Navy Department; and he also suggests, for the reasons which he assigns, that a similar transfer may wisely be made of the cruising revenue-vessels.

The Secretary forcibly depicts the intimate connection and interdependence of the navy and the commercial marine, and invites attention to the continued decadence of the latter, and the corresponding transfer of our growing commerce to foreign bottoms.

This subject is one of the utmost importance to the national welfare. Methods of reviving American ship-building, and of restoring the United States flag in the ocean carrying-trade, should receive the immediate attention of Congress. We have mechanical skill and abundant material for the manufacture of modern iron steamships in fair competition with our commercial rivals. Our disadvantage in building ships is the greater cost of labor, and in sailing them higher taxes and greater interest on capital, while the ocean highways are already monopolized by our formidable competitors. These obstacles should in some way be overcome, and for our rapid communication with foreign lands we should not continue to depend wholly upon vessels built in the yards of other countries, and sailing under foreign flags. With no United States steamers on the principal ocean lines or in any foreign ports, our facilities for extending our commerce are greatly restricted, while the nations which build and sail the ships, and carry the mails and passengers, obtain thereby conspicuous advantages in increasing their trade.

The report of the Postmaster-General gives evidence of the satisfactory condition of that department, and contains many valuable data and accompanying suggestions which can not fail to be of interest.

The information which it affords, that the receipts for the fiscal year have exceeded the expenditures, must be very gratifying to Congress and to the people of the country.

As matters which may fairly claim particular attention, I refer you to his observations in reference to the advisability of changing the present basis for fixing salaries and allowances, of extending the money-order system, and of enlarging the functions of the postal establishment so as to put under its control the telegraph system of the country, though from this last and most important recommendation I must withhold my concurrence.

At the last session of Congress, several bills were introduced into the House of Representatives for the reduction of letter postage to the rate of two cents per half ounce.

I have given much study and reflection to this subject, and am thoroughly persuaded that such a reduction would be for the best interests of the public.

It has been the policy of the Government, from its foundation, to defray, as far as possible, the expenses of carrying the mails by a direct tax in the form of postage. It has never been claimed, however, that this service ought to be productive of a net revenue.

As has been stated already, the report of the Postmaster-General shows that there is now a very considerable surplus in his department, and that henceforth the receipts are likely to increase at a much greater ratio than the necessary expenditures. Unless

some change is made in the existing laws, the profits of the postal service will, in a very few years, swell the revenues of the Government many millions of dollars. The time seems auspicious, therefore, for some reduction in the rates of postage. In what shall that reduction consist?

A review of the legislation which has been had upon this subject during the last thirty years, discloses that domestic letters constitute the only class of mail matter which has never been favored by a substantial reduction of rates. I am convinced that the burden of maintaining the service falls most unequally upon that class, and that more than any other it is entitled to present relief.

That such relief may be extended without detriment to other public interests, will be discovered upon reviewing the results of former reductions.

Immediately prior to the act of 1845, the postage upon a letter composed of a single sheet was as follows:

If conveyed—	Cents.
80 miles or less	6
Between 80 and 80 miles	10
Between 80 and 150 miles	12½
Between 150 and 400 miles	18½
Over 400 miles	25

By the act of 1845, the postage upon a single letter conveyed for any distance under 800 miles was fixed at 5 cents, and for any greater distance at 10 cents.

By the act of 1851, it was provided that a single letter, if prepaid, should be carried any distance not exceeding 3,000 miles for 3 cents, and any greater distance for 6 cents.

It will be noticed that both of these reductions were of a radical character, and relatively quite as important as that which is now proposed.

In each case there ensued a temporary loss of revenue, but a sudden and large influx of business, which substantially repaired that loss within three years.

Unless the experience of past legislation in this country and elsewhere goes for naught, it may be safely predicted that the stimulus of 33½ per cent. reduction in the tax for carriage, would at once increase the number of letters consigned to the mails.

The advantages of secrecy would lead to a very general substitution of sealed packets for postal cards and open circulars, and in divers other ways the volume of first-class matter would be enormously augmented. Such increase amounted in England, in the first year after the adoption of penny postage, to more than 125 per cent.

As a result of careful estimates, the details of which can not be here set out, I have become convinced that the deficiency for the first year after the proposed reduction would not exceed 7 per cent. of the expenditures, or \$3,000,000, while the deficiency after the reduction of 1845 was more than 14 per cent., and after that of 1851 was 27 per cent.

Another interesting comparison is afforded by statistics furnished me by the Post-Office Department.

The act of 1845 was passed in face of the fact that there existed a deficiency of more than \$30,000. That of 1851 was encouraged by the slight surplus of \$182,000. The excess of revenue in the next fiscal year is likely to be \$3,500,000.

If Congress should approve these suggestions, it may be deemed desirable to supply to some extent the deficiency which must for a time result, by increasing the charge for carrying merchandise, which is now only sixteen cents per pound. But even without such an increase, I am confident that the receipts under the diminished rates would equal the expenditures after the lapse of three or four years.

The report of the Department of Justice brings anew to your notice the necessity of enlarging the present system of Federal jurisprudence, so as effectually to answer the requirements of the ever-increasing litigation with which it is called upon to deal.

The Attorney-General renews the suggestions of his predecessor, that in the interests of justice better

provision than the existing laws afford should be made in certain judicial districts for fixing the fees of witnesses and jurors.

In my message of December last I referred to pending criminal proceedings growing out of alleged frauds in what is known as the star-route service of the Post-Office Department, and advised you that I had enjoined upon the Attorney-General and associate counsel, to whom the interests of the Government were intrusted, the duty of prosecuting with the utmost vigor of the law all persons who might be found chargeable with those offenses. A trial of one of these cases has since occurred. It occupied for many weeks the attention of the Supreme Court of this District, and was conducted with great zeal and ability. It resulted in a disagreement of the jury, but the cause has been again placed upon the calendar, and will shortly be retried. If any guilty persons shall finally escape punishment for their offenses, it will not be for lack of diligent and earnest efforts on the part of the prosecution.

I trust that some agreement may be reached which will speedily enable Congress, with the concurrence of the Executive, to afford the commercial community the benefits of a national bankrupt law.

The report of the Secretary of the Interior, with its accompanying documents, presents a full statement of the varied operations of that Department. In respect to Indian affairs, nothing has occurred which has changed or seriously modified the views to which I devoted much space in a former communication to Congress. I renew the recommendations therein contained as to extending to the Indian the protection of the law, allotting land in severalty to such as desire it, and making suitable provision for the education of youth. Such provision, as the Secretary forcibly maintains, will prove unavailing unless it is broad enough to include all those who are able and willing to make use of it, and should not solely relate to intellectual training, but also to instruction in such manual labor and simple industrial arts as can be made practically available.

Among other important subjects which are included within the Secretary's report, and which will doubtless furnish occasion for congressional action, may be mentioned the neglect of the railroad companies to which large grants of land were made by the acts of 1862 and 1864 to take title thereto, and their consequent inequitable exemption from local taxation.

No survey of our material condition can fail to suggest inquiries as to the moral and intellectual progress of the people.

The census returns disclose an alarming state of illiteracy in certain portions of the country where the provision for schools is grossly inadequate. It is a momentous question for the decision of Congress whether immediate and substantial aid should not be extended by the General Government for supplementing the efforts of private beneficence and of State and Territorial legislation in behalf of education.

The regulation of interstate commerce has already been the subject of your deliberations. One of the incidents of the marvellous extension of the railway system of the country has been the adoption of such measures by the corporations which own or control the roads as has tended to impair the advantages of healthful competition and to make hurtful discriminations in the adjustment of freightage.

These inequalities have been corrected in several of the States by appropriate legislation, the effect of which is necessarily restricted to the limits of their own territory.

So far as such mischiefs affect commerce between the States, or between any one of the States and a foreign country, they are subjects of national concern, and Congress alone can afford relief.

The results which have thus far attended the enforcement of the recent statute for the suppression of polygamy in the Territories are reported by the Secretary of the Interior. It is not probable that any addi-

tional legislation in this regard will be deemed desirable until the effect of existing laws shall be more closely observed and studied.

I congratulate you that the commissioners, under whose supervision these laws have been put in operation, are encouraged to believe that the evil at which they are aimed may be suppressed without resort to such radical measures as in some quarters have been thought indispensable for success.

The close relation of the General Government to the Territories preparing to be great States may well engage your special attention. It is there that the Indian disturbances mainly occur, and that polygamy has found room for its growth. I can not doubt that a careful survey of Territorial legislation would be of the highest utility. Life and property would become more secure. The liability of outbreaks between Indians and whites would be lessened. The public domain would be more securely guarded and better progress be made in the instruction of the young.

Alaska is still without any form of civil government. If means were provided for the education of its people and for the protection of their lives and property, the immense resources of the region would invite permanent settlements and open new fields for industry and enterprise.

The report of the Commissioner of Agriculture presents an account of the labors of that department during the past year, and includes information of much interest to the general public.

The condition of the forests of the country and the wasteful manner in which their destruction is taking place give cause for serious apprehension. Their action in protecting the earth's surface, in modifying the extremes of climate, and in regulating and sustaining the flow of springs and streams, is now well understood, and their importance in relation to the growth and prosperity of the country can not be safely disregarded. They are fast disappearing before destructive fires and the legitimate requirements of our increasing population, and their total extinction can not be long delayed unless better methods than now prevail shall be adopted for their protection and cultivation. The attention of Congress is invited to the necessity of additional legislation to secure the preservation of the valuable forests still remaining on the public domain, especially in the extreme western States and Territories, where the necessity for their preservation is greater than in less mountainous regions, and where the prevailing dryness of the climate renders their restoration, if they are once destroyed, well-nigh impossible.

The communication which I made to Congress at its first session in December last contained a somewhat full statement of my sentiments in relation to the principles and rules which ought to govern appointments to public service.

Referring to the various plans which had theretofore been the subject of discussion in the National Legislature (plans which in the main were modeled upon the system which obtains in Great Britain, but which lacked certain of the prominent features whereby that system is distinguished), I felt bound to intimate my doubts whether they, or any of them, would afford adequate remedy for the evils which they aimed to correct.

I declared, nevertheless, that if the proposed measures should prove acceptable to Congress they would receive the unhesitating support of the Executive.

Since these suggestions were submitted for your consideration there has been no legislation upon the subject to which they relate; but there has meanwhile been an increase in the public interest in that subject; and the people of the country, apparently without distinction of party, have in various ways and upon frequent occasions given expression to their earnest wish for prompt and definite action. In my judgment such action should no longer be postponed.

I may add that my own sense of its pressing importance has been quickened by observation of a

practical phase of the matter, to which attention has more than once been called by my predecessors.

The civil list now comprises about 100,000 persons, far the larger part of whom must, under the terms of the Constitution, be selected by the President, either directly or through his own appointees.

In the early years of the administration of the Government the personal direction of appointments to the civil service may not have been an irksome task for the Executive; but now that the burden has increased fully a hundred-fold it has become greater than he ought to bear, and it necessarily diverts his time and attention from the proper discharge of other duties no less delicate and responsible, and which, in the very nature of things, can not be delegated to other hands.

In the judgment of not a few who have given study and reflection to this matter, the nation has outgrown the provisions which the Constitution has established for filling the minor offices in the public service.

But whatever may be thought of the wisdom or expediency of changing the fundamental law in this regard, it is certain that much relief may be afforded, not only to the President and to the heads of the departments, but to Senators and Representatives in Congress, by discreet legislation. They would be protected in a great measure by the bill now pending before the Senate, or by any other which should embody its important features, from the pressure of personal importunity and from the labor of examining conflicting claims and pretensions of candidates.

I trust that before the close of the present session some decisive action may be taken for the correction of the evils which inhere in the present methods of appointment, and I assure you of my hearty cooperation in any measures which are likely to conduce to that end.

As to the most appropriate term and tenure of the official life of the subordinate employes of the Government, it seems to be generally agreed that whatever their extent or character, the one should be definite and the other stable, and that neither should be regulated by zeal in the service of party or fidelity to the fortunes of an individual.

It matters little to the people at large what competent person is at the head of this department or of that bureau, if they feel assured that the removal of one and the accession of another will not involve the retirement of honest and faithful subordinates, whose duties are purely administrative and have no legitimate connection with the triumph of any political principles or the success of any political party or faction. It is to this latter class of officers that the Senate bill, to which I have already referred, exclusively applies.

While neither that bill nor any other prominent scheme for improving the civil service concerns the higher grade of officials, who are appointed by the President and confirmed by the Senate, I feel bound to correct a prevalent misapprehension as to the frequency with which the present Executive has displaced the incumbent of an office and appointed another in his stead.

It has been repeatedly alleged that he has in this particular signally departed from the course which has been pursued under recent administrations of the Government. The facts are as follow:

The whole number of executive appointments during the four years immediately preceding Mr. Garfield's accession to the presidency was 2,696.

Of this number, 244, or 9 per cent., involved the removal of previous incumbents.

The ratio of removals to the whole number of appointments was much the same during each of those four years.

In the first year, with 790 appointments, there were 74 removals, or 9·3 per cent.; in the second, with 917 appointments, there were 85 removals, or 8·5 per cent.; in the third, with 490 appointments, there were 48 removals, or 10 per cent.; in the fourth, with 429 appointments, there were 37 removals, or 8·6 per cent. In the four months of President Garfield's adminis-

tration there were 390 appointments and 89 removals, or 23.7 per cent. Precisely the same number of removals (89) has taken place in the fourteen months which have since elapsed, but they constitute only 7.8 per cent. of the whole number of appointments (1,118) within that period, and less than 2.6 of the entire list of officials (3,459), exclusive of the army and navy, which is filled by presidential appointment.

I declare my approval of such legislation as may be found necessary for supplementing the existing provisions of law in relation to political assessments.

In July last I authorized a public announcement that employes of the Government should regard themselves as at liberty to exercise their pleasure in making or refusing to make political contributions, and that their action in that regard would in no manner affect their official status.

In this announcement I acted upon the view which I had always maintained and still maintain, that a public officer should be as absolutely free as any other citizen to give or to withhold a contribution for the aid of the political party of his choice. It has, however, been urged, and doubtless not without foundation in fact, that by solicitation of official superiors and by other modes such contributions have at times been obtained from persons whose only motive for giving has been the fear of what might befall them if they refused. It goes without saying that such contributions are not voluntary, and in my judgment their collection should be prohibited by law. A bill which will effectually suppress them will receive my cordial approval.

I hope that however numerous and urgent may be the demands upon your attention, the interests of this District will not be forgotten.

The denial to its residents of the great right of suffrage in all its relation to national, State, and municipal action, imposes upon Congress the duty of affording them the best administration which its wisdom can devise.

The report of the District commissioners indicates certain measures whose adoption would seem to be very desirable. I instance in particular those which relate to arrears of taxes, to steam railroads, and to assessments of real property.

Among the questions which have been the topic of recent debate in the halls of Congress none are of greater gravity than those relating to the ascertainment of the vote for presidential electors and the indentment of the Constitution in its provisions for devolving executive functions upon the Vice-President when the President suffers from inability to discharge the powers and duties of his office.

I trust that no embarrassments may result from a failure to determine these questions before another national election.

The closing year has been replete with blessings for which we owe to the Giver of all good our reverent acknowledgment. For the uninterrupted harmony of our foreign relations, for the decay of sectional animosities, for the exuberance of our harvests and the triumphs of our mining and manufacturing industries, for the prevalence of health, the spread of intelligence and the conservation of the public credit, for the growth of the country in all the elements of national greatness—for these and countless other blessings—we should rejoice and be glad. I trust that under the inspiration of this great prosperity our counsels may be harmonious, and that the dictates of prudence, patriotism, justice, and economy may lead to the adoption of measures in which the Congress and the Executive may heartily unite.

CHESTER A. ARTHUR.

WASHINGTON, December 4, 1883.

Civil-Service Reform.—One of the most important subjects brought up for consideration during the session was the bill for the reform of the civil service, which had fallen by the way in the previous session. It was reported in

the Senate Dec. 12th from the Committee on Civil Service and Retrenchment, with various amendments, which were agreed to without debate. Mr. Pendleton, of Ohio, who originally introduced the bill and had charge of it, opened the discussion of the measure as amended. He said:

"The necessity of a change in the civil administration of this Government has been so fully discussed in the periodicals and pamphlets and newspapers, and before the people, that I feel indisposed to make any further argument. This subject, in all its ramifications, was submitted to the people of the United States at the fall elections, and they have spoken in no low or uncertain tone.

"I do not doubt that local questions exerted great influence in many States upon the result; but it is my conviction, founded on the observation of an active participation in the canvass in Ohio, that dissatisfaction with the methods of administration adopted by the Republican party in the past few years was the most important single factor in reaching the conclusion that was attained. I do not say that the civil service of the Government is wholly bad. I can not honestly do so. I do not say that the men who are employed in it are all corrupt or inefficient or unworthy. That would do very great injustice to a great number of faithful, honest, and intelligent public servants. But I do say that the civil service is inefficient; that it is expensive; that it is extravagant; that it is in many cases and in some senses corrupt; that it has welded the whole body of its employes into a great political machine; that it has converted them into an army of officers and men, veterans in political warfare, disciplined and trained, whose salaries, whose time, whose exertions at least twice within a very short period in the history of our country have robbed the people of the fair results of presidential elections.

"I repeat, Mr. President, that the civil service is inefficient, expensive, and extravagant, and that it is in many instances corrupt. Is it necessary for me to prove facts which are so patent that even the blind must see and the deaf must hear?

"At the last session of Congress, in open Senate, it was stated and proved that in the Treasury Department at Washington there are 3,400 employes, and that of this number the employment of less than 1,600 is authorized by law and appropriations made for their payment, and that more than 1,700 are put on or off the rolls of the department at the will and pleasure of the Secretary of the Treasury, and are paid not out of appropriations made for that purpose but out of various funds and balances of appropriations lapsed in the Treasury in one shape or another, which are not by law appropriated to the payment of these employes. I was amazed. I had never before heard that such a state of affairs existed. I did not believe it was possible until my honorable col-

league rose in his place and admitted the general truth of the statement and defended the system as being necessary for the proper administration of the Treasury Department.

"Mr. President, we see in this statement whence comes that immense body of public officials, inspectors, detectives, deputies, examiners, from the Treasury Department who have for years past been sent over the States for the purpose of managing presidential conventions and securing presidential elections at the public expense.

"I hold in my hand a statement made before the committee which reported this bill, showing that in one of the divisions of the Treasury Department at Washington, where more than nine hundred persons were employed, men and women, five hundred and more of them were entirely useless, and were discharged without in any degree affecting the efficiency of the bureau. I do not intend to misstate any fact to-day if I can avoid it, and therefore I read from the testimony taken before the committee. Every gentleman can find it if he has not it already on his table. The statement to which I refer I read from page 121 of report of committee No. 576 :

"The extravagance of the present system was well shown in the examination of the Bureau of Engraving and Printing by a committee of which I was chairman. Of a force of 958 persons, 539, with annual salaries amounting to \$390,000, were found to be superfluous and were discharged. The committee reported that for years the force in some branches had been twice and even three times as great as the work required. In one division a sort of platform had been built underneath the iron roof, about seven feet above the floor, to accommodate the surplus counters. It appeared that the room was of ample size without this contrivance for all the persons really needed. In another division were found twenty messengers doing work which it was found could be done by one. The committee reported that the system of patronage was chiefly responsible for the extravagance and irregularities which had marked the administration of the bureau, and declared that it had cost the people millions of dollars in that branch of the service alone. Under this system the office had been made to subserv the purpose of an almshouse or asylum.

"In consequence of this report the annual appropriation for the Printing Bureau was reduced from \$800,000 to \$300,000, and out of the first year's savings was built the fine building now occupied by that bureau.

"And again, on page 126, this same gentleman says :

"My observation teaches me that there is more pressure and importunity for these places [that is, the \$900 clerkships], and that more time is consumed by heads of departments, and those having the appointing power, in listening to applications for that grade than for all the other places in the departments combined ; and that when it is discretionary with a department to appoint a man or a woman, the choice is usually exercised in favor of the woman. I know a recent case in the Treasury Department where a vacancy occurred which the head of the bureau deemed it important to fill with a man. It was a position where a man's services were almost indispensable ; but the importunity was so great that he was compelled to accept a woman, although her services were not required. In consequence of this importunity for places for women a practice has grown up in the Treasury Department of allowing the salaries of the

higher grades of clerkships to lapse when vacancies occur, and of dividing up the amount among clerks, usually women, at lower salaries. In the place of a male clerk at \$1,800 a year, for instance, three women may be employed at \$600. Often the services of a man are required in its higher grade, while the women are not needed at all ; but as the man can not be employed without discharging the women, he can not be had. The persons employed in this way are said to be 'on the lapse.' Out of this grew the practice known in departmental language as 'anticipating the lapse.'

"In the endeavor to satisfy the pressure for place more people are appointed on this roll than the salaries then lapsing will warrant, in the hope that enough more will lapse before the end of the fiscal year to provide funds for their payment. But the funds almost always run short before the end of the year, and then either the 'lapse' appointees must be dropped or clerks discharged from the regular roll to make place for them. In some instances, in former administrations, the employes on the regular roll were compelled, under terror of dismissal, to ask for leaves of absence, without pay, for a sufficient time to make up the deficiency caused by the appointment of unnecessary employes 'on the lapse.' Another bad feature is that these 'lapse' employes being appointed without regard to the necessities of the work, for short periods and usually without regard to their qualifications, are of little service, while their employment prevents the filling of vacancies on the regular roll, and demoralizes the service.

"In one case thirty-five persons were put on the 'lapse fund' of the Treasurer's office for eight days at the end of a fiscal year, to sop up some money which was in danger of being saved and returned to the Treasury.

"Says this gentleman further :

"I have no doubt that under a rigid application of this proposed system the work of the Treasury Department could be performed with two thirds the number of clerks now employed, and that is a moderate estimate of the saving.

"Mr. President, a Senator who is now present in the chamber and who will recognize the statement when I make it, though I shall not indicate his name, told me that the Secretary of one of the departments of the Government said to him, perhaps to the Committee on Appropriations, at the last session, that there were seventeen clerks in his department for whom he could find no employment ; that he did need one competent clerk of a higher grade, and if the appropriation were made for that one clerk, at the proper amount, according to the gradations of the service, and the appropriation for the seventeen were left out, he could, without impairing the efficiency of his department, leave those seventeen clerks off the roll ; but if the appropriation should be made, the personal, social, and political pressure was so great that he would be obliged to employ and pay them, though he could find no employment for them.

"Need I prove, Mr. President, that which is known to all men, that a systematic pressure has been brought upon the clerks in the departments of the Government this year to extort from them a portion of the salary that is paid to them under a system which the President himself scouts as being voluntary, and that they are led to believe and fairly led to believe that they have bought and paid for the

offices which they hold, and that the good faith of those who take from them a portion of the salary is pledged to their retention in their positions?

"I have said before upon the floor of the Senate that this whole system demoralizes everybody who is engaged in it. It demoralizes the clerks who are appointed. That is inevitable. It demoralizes those who make the appointment. That also is inevitable. And it demoralizes Senators and Representatives, who, by the exercise of their power as Senators and Representatives, exert pressure upon the appointing power.

"I am disposed to speak with due moderation and with respect for every gentleman who sits in this chamber. I certainly desire, in a statement like this, not to make personal reflections upon anybody; but I say that this system, permeating the whole civil service of the country, demoralizes everybody connected with it, the clerks, the appointing power, and those who, by their official position and their relations to the executive administration of the Government, have the influence necessary to put these clerks in office.

"Mr. President, how can you expect purity, economy, efficiency to be found anywhere in the service of the Government if the report made by this committee to the Senate has even the semblance of truth? If the civil service of the country is to be filled up with superfluous persons, if salaries are to be increased in order that assessments may be paid, if members of Congress having friends or partisan supporters are to be able to make places for them in public employment, how can you expect Senators and Representatives to be economical and careful in the administration of the public money?

"Mr. President, it was these methods of administration, it was these acts of the Republican party, which made it possible for the Democratic party, and other men who prized their country higher than they did their party, to elect in Ohio a Democratic ticket by eighteen to twenty thousand majority, and elect sixteen out of the twenty-one members of Congress assigned to that State.

"Under the impulse of this election in Ohio, upon these facts and influences which I have stated as being of great importance there, it became possible for the Democratic party and its allies, whom I have described, to elect a Democratic Governor in New York, in Massachusetts, in Kansas, in Michigan, and various other States in which there has been none but a Republican Governor for many years past. The same influences enable us, having accessions to our ranks from Iowa and Wisconsin and Michigan and Pennsylvania, to have at the beginning of the next session of Congress an aggregate of perhaps sixty or more Democratic majority in the House of Representatives.

"I beg the Democratic party throughout the country not to mistake this result of last

fall as a purely Democratic triumph. It was achieved by the Democratic party with the assistance of men of all parties upon whom their love of country sat heavier than their love of party. It was a protest made by an awakened people, who were indignant at the wrongs which had been practiced upon them. It was a tentative stretching out of that same people to find instrumentalities by which those wrongs could be righted.

"The people demanded economy, and the Republican party gave them extravagance. The people demanded a reduction of taxation, and the Republican party gave them an increase of expenditure. The people demanded purity of administration, and the Republican party reveled in profligacy; and when the Republican party came to put themselves on trial before that same people, the people gave them a day of calamity.

"I beg that my colleagues on this side of the chamber may remember, I desire that our party associates throughout the country shall remember, that the people will continue to us their confidence and increase it, that they will continue to us power and increase it, just in the proportion that we honestly and fairly and promptly answer to the demands which the people have made, and which were thus responded to by the Republican party. They asked revenue reform, and they received none. They asked civil-service reform, and they obtained none. They asked that the civil service of this Government should not, either as to its men or its expenditures, be made the basis upon which political contests were to be carried on, and they received for answer that that was an old fashion and a good method of political warfare. I beg gentlemen upon this side of the chamber to remember that, if they desire to escape the fate which now seems to be impending upon their adversaries, they must avoid the example which those adversaries have set them,

"Mr. President, the bill which I have the honor to advocate to-day, and which is reported by a committee of the Senate, is the commencement, in my humble judgment, of an attempt to answer to one of the demands which the people have authoritatively made. I speak advisedly. It is the commencement of an attempt to organize a system which shall respond to one of the demands which the people have made.

"I suppose the most enthusiastic supporter of this bill will not pretend that it is perfect. I suppose he will not pretend that upon the adoption of this bill a system will immediately spring into life which will perfect and purify the civil service of the Government. But it is the commencement of an attempt to lay the foundations of a system which, if it shall answer in any reasonable degree the expectation of those who by experience and faithful study have framed it, it will in the end correct the abuses to which I have alluded, and which have

been delineated by no enemy of the Republican party or of the Administration in the report which I have read to the Senate.

"The bill has for its foundation the simple and single idea that the offices of the Government are trusts for the people; that the performance of the duties of those offices is to be in the interest of the people; that there is no excuse for the being of one office or the paying of one salary except that it is in the highest practicable degree necessary for the welfare of the people; that every superfluous office-holder should be cut off; that every incompetent office-holder should be dismissed; that the employment of two where one will suffice is robbery; that salaries so large that they can submit to the extortion, the forced payment, of 2 or 10 per cent. are excessive and ought to be diminished. I am not speaking of purely voluntary contributions.

"If it be true that offices are trusts for the people, then it is also true that the offices should be filled by those who can perform and discharge the duties in the best possible way. Fidelity, capacity, honesty, were the tests established by Mr. Jefferson when he assumed the reins of government in 1801. He said then, and said truly, that these elements in the public offices of the Government were necessary to an honest civil service, and that an honest civil service was essential to the purity and efficiency of administration, necessary to the preservation of republican institutions.

"Mr. Jefferson was right. The experience of eighty years has shown it. The man best fitted should be the man placed in office, especially if the appointment is made by the servants of the people. It is as true as truth can be that fidelity, capacity, honesty, are essential elements of fitness, and that the man who is most capable and most faithful and most honest is the man who is the most fit, and he should be appointed to office.

"These are truths that in their statement will be denied by none, and yet the best means of ascertaining that fitness has been a vexed question with every administration of this Government and with every man who has been charged with the responsibility of its execution. We know what is the result. Pass examinations have been tried; professions have been tried; honest endeavors have been tried; a disposition to live faithfully up to these requirements has been tried; and yet we know, and the experience of to-day shows it, that they have all made a most lamentable failure. We do know that now so great has been the increase of the powers of this Government and the number of officers under it that no President, no Cabinet, no heads of bureaus, can by possibility know the fitness of all applicants for the subordinate offices of the Government. The result has been, and under the existing system it must always be, that the President and his Cabinet and those who are charged with the responsibility have remitted the question of fitness to

their own partisan friends, and those partisan friends have in their turn decided the question of fitness in favor of their partisan friends. The Administration has need of the support of members of Congress in carrying on its work. It therefore remits to members of Congress of its own party the questions of appointment to office in the various districts. These gentlemen, in the course of their political life, naturally (I do not find fault with them for it) find themselves under strain and pressure to secure a nomination or a renomination or election, and they use the places to reward those whose friends and families and connections and aids and deputies will serve their purpose.

"I put it to gentlemen, particularly to my friends on this side of the chamber, because you have not the opportunity to exercise this patronage as much as our friends on the other side, whether or not the element of fitness enters largely into the questions of appointment in your respective districts and States. It can not be. The necessities of the case prevent it. The pressure upon men who want to be elected prevents it. The demands that are made by partisan friends and those who have been influential and potent in securing personal triumph to gentlemen who may happen to be in such relation to the appointing power that they have the influence to secure appointment prevents it. The result is, as I have stated, that instead of making fitness, capacity, honesty, fidelity, the only or the essential qualifications for office, personal fidelity and partisan activity alone control.

"When I came to the Senate I had occasion more than ever before to make some investigation upon this subject, and I found to my surprise the extent to which the demoralization of the service had gone. I saw the civil service debauched and demoralized. I saw offices distributed to incompetent and unworthy men as a reward for the lowest of dirty partisan work. I saw many men employed to do the work of one man. I saw the money of the people shamefully wasted to keep up electioneering funds by political assessments on salaries. I saw the whole body of the public officers paid by the people organized into a compact, disciplined corps of electioneers obeying a master as if they were eating the bread of his dependence and rendering him personal service.

"I believed then, and I believe now, that the existing system which, for want of a better name, I call the 'spoils system,' must be killed, or it will kill the republic. I believe that it is impossible to maintain free institutions in the country upon any basis of that sort. I am no prophet of evil, I am not a pessimist in any sense of the word, but I do believe that if the present system goes on until 50,000,000 people shall have grown into 100,000,000, and 140,000 officers shall have grown into 800,000, with their compensation in proportion, and all shall depend upon the accession of one party or the other to the presidency and to the execu-

tive functions, the presidency of the country, if it shall last in name so long, will be put up for sale to the highest bidder, even as in Rome the imperial crown was put up to those who could raise the largest fund.

"I beg gentlemen to believe that whatever I may have said as to the relations of parties I do not approach the question of the reform of the civil service in any mere partisan spirit. It was because I thought I saw this danger, because I believed that it was imminent, because I believed then as I do now that it is destructive of republicanism and will end in the downfall of republican government, that I felt it my duty to devote whatever ability I had to the consideration of this subject. It was that which induced me a year or two ago to introduce a bill which after the best reflection, the best study, the best assistance that I could get I did introduce in the Senate, and which, in some degree modified, has come back from the Committee on Civil Service Reform, and is now pending before this body.

"Mr. President, it is because I believe the 'spoils system' to be a great crime, because I believe it to be fraught with danger, because I believe that the highest duty of patriotism is to prevent the crime and to avoid the danger, that I advocate this or a better bill if it can be found for the improvement of the civil service.

"I am told, and I am sure that I am not far out of the way, if I am not exactly accurate, that the number of such offices does not exceed thirty or perhaps thirty-five, and that the number of persons who are employed in them, together with those in the departments here, will not exceed 10,000.

"I said that this was a tentative effort; that it was intended to be an experiment, and it is because it is tentative, because it is intended to be an experiment, that the committee thought it advisable in its initial stages to limit it, as they have limited it, in the bill. The bill does not apply to elective officers of course, nor to officers appointed by the President by and with the advice and consent of the Senate, nor to the military, nor to the naval, nor to the judicial establishment. It applies simply now to those officials who are employed in the departments here and in the large offices of the Government elsewhere, first, because as an experiment it was thought that it gave scope enough to test its value and labor enough to employ all those who are engaged in putting it in operation until its merits shall be fairly tried and it shall commend itself either to the approval or the condemnation of the American people.

"There was another reason. The heads of offices and bureaus, where the number of employes is small, can themselves personally judge of the fitness of persons who are applicants for appointment, knowing as they do more or less in their narrow communities their antecedents, their habits, and their modes of life.

"The bill does not touch the question of tenure of office or of removal from office. I see it stated by those who do not know that it provides for a seven years' tenure of office. There is nothing like it in the bill. I see it stated that it provides against removals from office. There is nothing like it in the bill. Whether or not it would be advisable to fix the tenure of office, whether or not it would be advisable to limit removals, are questions about which men will differ; but the bill as it is and as we invoke the judgment of the Senate upon it contains no provisions either as to tenure of office or removals from office. It leaves those questions exactly where the law now finds them. It concerns itself only with admission to the public service; it concerns itself only with discovering in certain proper ways or in certain ways—gentlemen may differ as to whether they are proper or not—the fitness of the persons who shall be appointed. It takes cognizance of the fact that it is impossible for the head of a department or a large office personally to know all the applicants, and therefore it provides a method by which, when a vacancy occurs by death, by resignation, by the unlimited power of removal, a suitable person may be designated to fill the vacancy. It says in effect that when a vacancy occurs in the civil service of the lowest grade, everybody who desires entrance shall have the right to apply. Everybody, humble, poor, without patronage, without influence, whatever may be his condition in life, shall have the right to go before the parties charged with an examination of his fitness and there be subjected to the test of open, regulated, fair, impartial examination.

"Now, Mr. President, recurring to what I have said as to the scope of this bill, to the officers who are embraced in it, to the avoidance of the question of removal and tenure, I have only to say that the machinery of the bill is that the President shall call to his aid the very best assistance, with or without the concurrence of the Senate—for that is a matter about which gentlemen perhaps would differ, and upon it I have no very fixed opinion—that the President shall, with the concurrence of the best advice which he can obtain, form a plan, a scheme of examination free for all, open to all, which shall secure the very best talent and the very best capacity attainable for the civil offices of the Government. The method adopted in the bill is by competitive examination. That method has been imperfectly tried throughout the country. I have here the statement of the Postmaster of New York who has given much attention and has had great experience in this matter. I have here his statement that the business of his office increased 150 per cent. within a certain number of years, and the expenses increased only 2 per cent.

"Says Mr. Pearson, 'To be specific, while the increase in the volume of matter has been from 150 to 300 per cent., the increase in cost has only been about 2 per cent.'

"Mr. Graves, whose testimony I read before, has stated as the result of the efforts which were made by Gen. Grant during the period that he was allowed any funds for the purpose of putting this scheme into operation, that the expenses of the departments here can be reduced at least one third.

"I have heard it said that this system of examination proposes to present only a scholastic test; that it proposes only to give advantage to those who are college-bred, and have had the advantage in early life of superior education. The committee investigated that subject to some extent, and I have here the result in the city of New York. Says Mr. Burt:

"Taking seven hundred and thirty-one persons examined, 60 per cent. of the appointees selected from them had been educated simply in the common schools of the country; 83½ per cent. had received what they call academic or high-school education; and 6½ per cent. a collegiate education. In all the statistics in regard to common-school education there is one little weakness resulting from the fact that we have to throw in that class men who have had hardly any education, men who will say, 'I went to school until I was eleven years old,' or 'I went to school in the winter,' or something of that kind. We have to throw them in that class, and it rather reduces the average standing in that category. As to the matter of age, we have very thoroughly exploded that objection. There have been some young men of twenty-one and twenty-two who have come in, but the average has been above thirty, and it is astonishing that it is the men above thirty who make the best time on examination, who show a facility to get through work quickly.

"He goes on to say:

"Yet about two thirds of the appointees had a common-school education; had not even an academic education.

"Of course these examinations must be proper; of course they must be regulated upon common-sense principles; of course they must be conducted to test the fitness of the men who are to be appointed to particular offices. You have tests everywhere. To-day the law requires that there shall be a test of examination in the various departments here in Washington. They are pass examinations; they are imperfect; they are insufficient; they are not thorough. Mr. Graves himself says that the only examination in his case was that the superior in the department looked over his shoulder while he was writing and said, 'I think you will pass.' That was when he entered the service twenty-odd years ago.

"If you have examinations, why not have competitive examinations? If you have private pass examinations, why not have open examinations? If examinations are to be made in the departments by subordinates of the departments, why not have them made by responsible examiners amenable to the authority of the President under a system devised by the best intelligence that can be supplied?

"I hear the system of competitive examination spoken of as if it were something extraordinary. Within the last fifteen years it has gotten to be a custom that I might almost say

is universal that when a member of Congress has the right to appoint a cadet to West Point or to the Naval Academy he asks his constituents to compete for it. Formerly it was never done; it was looked on as the mere perquisite of a member of Congress. I appointed a gentleman to West Point who graduated at the head of his class, and now is an active and vigorous spirit of the Military Academy. I appointed him simply upon my own personal examination and knowledge. It would not be done now; it could not be done now; the public sentiment is against it. The public sentiment of the district that I then represented would not permit it; but open competitive examinations are demanded, and everybody having the requisite qualifications of age and health and vigor can compete for the appointment.

"Why not apply that system to the Executive Departments of this Government? What earthly reason can there be why when you desire to appoint the best and fittest man for the place that is vacant he should not subject himself to the competition of other people who desire to have that place? Of course, as I said before, this all goes upon the basis that there shall be reasonable examination and reasonable competition."

Mr. Hawley, of Connecticut, followed in the same strain. He said: "This is 'a bill to regulate and improve the civil service of the United States.' It is not a new subject, nor is the bill itself, in its essential particulars, new to the Senate or to the public. Something is to be done upon this subject. Beyond all manner of question there is something to be done. The experience of this country as to the evils of the existing system, the experience of other countries in the trial of improved systems and aside from any evils that exist among us, the extraordinary growth of this country, render the continuance of the present system utterly impossible. All these things combined, with a stronger and stronger manifestation of public sentiment from year to year, show, as I said, that something is to be done.

"When our country began with what I may call the present system, which is a lack of system, there were 850,000 square miles of territory; there are now 4,000,000 square miles. There were 3,000,000 of people; there are now 55,000,000 of people, or will be by next June, and there has been an addition of 25 States. In 1801 there were 906 post-offices; there are now 44,848. There were 69 custom-houses; there are now 135. The revenues were less than \$3,000,000; now they are \$400,000,000. Our ministers to foreign countries were 4; they are now 33. Our consuls were 63; they are now 728. A thousand men then administered the Government; it now requires more than 100,000.

"In many offices, I might say in every one of the departments and bureaus of the Government, the chief might, originally, well be re-

quired to have personal acquaintance with the character, the mental abilities, the fitness in general of his appointees. To require or expect any such knowledge now is quite ridiculous indeed, with a Treasury Department alone that has more than 3,000 employes, and single subordinate offices outside of Washington that have nearly twice as many employes as the whole Government had ninety years ago.

"The doctrine of old was a better doctrine than that we have lately practiced. It taught that the power and duty of making removals were vested in the President alone. It may be the theory now, but it is not wholly acknowledged to be such by the Tenure-of-Office Act, and in practice it is certainly not the law. Fidelity and efficiency were the measures of tenure, as capacity and character were the tests for appointment.

"Here are some figures which have been made familiar during the discussion of this question. Washington made only nine removals, and all for cause; John Adams only nine, and none, it would seem, by reason of political cause; Jefferson only thirty-nine, and none of them, as he declared, for political reasons; Madison only five; Monroe only nine; John Quincy Adams only two, and all for cause. In general, the Government was very honestly and admirably administered.

"There has been a constant and a steady growth of the idea that offices might be used to strengthen candidates and to reward active workers. The doctrine that 'to the victors belong the spoils' became (though it always provoked a smile) the practical rule of the country. The evils of the existing system can not be denied by any man, whatever his position, with regard to any of the pending measures for civil-service reform. They are obvious, more clearly obvious to members of Congress than to anybody else. They are obvious in the suffering and humiliation of the employes. The condition of the majority of them is pitiable. They are under a sort of degradation that we have no right to impose upon our friends and neighbors and fellow-citizens. They are only partially secured in their positions by their character and by the good work they may do. How well we know that they do not depend upon those things to maintain them in place; that they are constantly coming to members of Congress and applying to influential friends everywhere to strengthen what they call their 'influence,' till the word 'influence' has become a cant term, a slang term among them. 'Who is your influence?' is the phrase. 'I have none. My influence is dead.' Or, 'My influence was in Congress ten or fifteen years ago, and he is not in political life now, or he has no influence himself'; 'I must get some influence,' etc., etc. These are the every-day phrases among the employes; and whenever a new chief of a bureau comes in, not to say a new Cabinet officer or a new President, there is a hurrying

and a scurrying among all the terrified flock to strengthen themselves in position; not by the good record they may have or the good character they may have maintained, but by the recommendations of political friends. By this system the inefficient are kept in longer than they would be otherwise. These are facts so well known that I ought to ask pardon for repeating them.

"The man who is less efficient than his fellows, conscious that he has less of character or of ability, or of both, than they, is the man who is almost certain to have the largest pile of papers in support of his position. And thereby it becomes exceedingly difficult to remove him. More persons are needed for the same labor than there would be under some ideal system, I do not say what. We can imagine that if they were appointed purely for efficiency and character and maintained for that, fewer persons—I do not pretend to say how many, because no man knows; the estimates are quite at random; some say a quarter less, some say a half—would do the work equally well.

"Moreover, there is unnecessary expense. The salaries must be kept higher in accordance with obvious laws of economy, because people will not enter into an uncertain service for the price they would be willing to take if they were guaranteed long continuance, or life service. A young man who comes here for one, two, three, four, or five years, is very hungry indeed to get his ten, twelve, or fourteen hundred dollars a year. If he had any guarantee of long service, or of service during good behavior (and absolutely no minute longer than that), there would be in abundance young men of capacity willing to come here and begin at six, seven, eight, or nine hundred dollars a year, trusting to a well-graded system for promotion to nine, ten, eleven, or twelve hundred dollars, as they continued in the service. Our present system is therefore, in that sense, wasteful and extravagant.

"There is another matter upon which I need not dwell in this audience, and that is the torment of the legislative branch. Senators know this well. I am happy to say I know a little less of it than some of my neighbors; but those who represent large States, especially if they are within easy reach of Washington, deserve our commiseration and should every Sunday, in the old fashion of New England, ask for the prayers of the congregation. Their desks are piled with letters, from scores upon scores, and their constituents sometimes stand in their corridors in the same proportions. How large a share and how painful a share of our troubles and anxieties are due to this matter of office-seeking, we all know too well. We are all under the necessity of hearing innumerable applications for office, of reading and preparing papers that will sustain them, of calling in person, and perhaps repeatedly, to enforce applications, of writing innumerable

letters in reference to the matter; of re-enforcing the support that an employé has; or of seeking to restore those who are discharged in times of reduction or for an alleged or a real falling below the standard, or discharged, perhaps, to give place to a *protégé* of some more favored or more ardent politician.

"We listen to the appeals of the utterly destitute. The widow comes here whose husband has been a long time a clerk or public servant somewhere, and it is impossible not to sympathize, it is impossible not to say that it would be reasonable, if she were well qualified, that she should have a clerkship. She has a dependent family; she has, perhaps, dependent relatives. You know there are scattered about these departments many who are the children of men well known in the public service of the United States, and among whose honors it was that they went out of that service penniless, whose misfortune it was that they left dependent relatives. No man can say, 'I will close my eyes and shut my ears to these appeals.' He can not do it. He may put himself upon the cold ground that 'it is my duty to be studying public measures, to be reading and thinking about and preparing for the great measures that concern the whole country'; but he comes up from his breakfast-table and finds his room full of cases that he must at least hear.

"Nor is this a matter that embarrasses one party alone. I have known gentlemen—yes, I see one now in the chamber, not a member of my own party, whom I have heard cry out against the burden, the painful labor that pained and oppressed him, and, in the vexation of the moment, declare that he would leave this hall, and go back to his farm and his happy home. There is something wrong about all this. This Government is not running a great charitable establishment; and yet, if it is to employ people in subordinate positions, you will say that equitably nobody has a better claim than a widow, or daughter, or sister, or brother of some old-time public servant, whose family for many years has been accustomed to the service of the United States, knows what it is, and can discharge the duties well; or than the dependent relative of some faithful soldier.

"There must be some relief. I said there will be. I say there can be one easily found, theoretically. Every man here, whether opposed to civil-service reform, in the ordinary language, or in favor of it, sees that he can devise some plan by which these things can be very much bettered. Well, practically there has been, in a limited area in this country, a vast improvement, and that area can be extended. I forbear to illustrate by the example of Great Britain, chiefly because many of the circumstances there are quite different. The ancient history of the civil service is different; the relations of executive and legislative power are different. They have an avowed life-term; they have pensions; they have a right of pen-

sion that grows with the years of service, analogous to what the army calls the 'old foggy ration.' There are various provisions there for which our public sentiment is not ripe, I am sure.

"Now, the bill before us does not attempt to reach the whole possible field of civil-service reform. Say there are a hundred acres over which you may imagine that it could spread. We know we have established it well in one or two or three of the hundred acres, and we know perfectly well that there are ten or fifteen acres quite analogous in conditions in which it can be equally well established; and these are about the proportions of what the present bill proposes to do. It makes no experiment; there is not a thing to be done here in this bill that has not been done, that is not being done every month, in the post-office and custom-house at New York, and to a limited extent in other places.

"The bill contains within itself a power of indefinite extension according to the judgment of the commissioners or the chief executive officer. Now, do not let us indulge in any ideal views on this subject—ideal in the direction of optimism or otherwise. You hear some of the ardent and enthusiastic friends of this measure, just as you will hear in all cases of change or reform, believing that all the evils of the civil service will vanish the moment you shall have put an iron framework of some description upon the statute-book. That is not to be so. There are to be evils, there are to be misfortunes, there are to be, if you choose, weaknesses and corruptions, no matter what system you may adopt. But I protest a great deal more vigorously against an extreme denunciation of the existing system of the country. It has become the fashion—and I take the opportunity to say it here—it has become the fashion, very largely among a class of men who have, or claim for themselves, and may to some extent be admitted to have, a culture superior to the average—the literary, the *dilettante* fashion—to speak of the whole public service of this country as corrupt. I have read, and you all have lately, and you will read frequently, in articles by these gentlemen contributed to the journals and the reviews, and in their speeches and letters, constant reference to the ruinous condition of this country and to the corrupt state of the whole public service, to the degradation of politics. These men will say, and visitors from other nations will hear them and go home and write, that gentlemen here can not enter into political affairs, and that if such and such things were different the men of culture and education and standing in the community, the gentlemen of America, would go into politics. They have no right to this language. The gentleman, the true gentleman, sir, if he sees that his country needs the reform he alleges, if he believes that its politics are in the low, mean, and corrupt condition often described, will charge into the middle of the fray; he will put himself into

politics. I have an unutterable contempt for the man who justifies his neglect of his public duties by talking about the dirty waters of politics. If they are dirty, and he thinks he knows what they ought to be, and that if he were controlling them they would be better, then he is a coward and next door to a moral traitor if he does not come in with all his soul, and not simply sit on the fence and scold the rest of us who are in, and who are conscious of as high and honorable motives, conscious of as devoted worship of the Constitution and the laws and the glory of our country as any man in the republic.

"Sir, this country is not in a ruinous condition; it is the most magnificent nation that ever lived under the sun. There are fifty-five millions of people here; some of us now here will be living when they shall number one hundred millions of people. The nation has gone through the most glorious war known in history. I am not now speaking of it at all in a partisan way. If you go to the very essence of it on both sides, it was a contest over the very fundamental question of society and of government. It was a case where forty millions of people took up the sword by the hundred thousand, and even by the million, to settle controversies, not concerning the control of the Suez canal or the Bosphorus, or this, that, or the other mere territorial or trade question, but to decide upon the political and social foundations on which the future hundreds of millions of this continent shall rest.

"Look at our general financial condition. There is not a nation in the world that does not envy us the embarrassment under which we labor to-day, the embarrassment of an extraordinary and excessive revenue. We are pained by what? By debts that stagger and shake us? No; by the question of how we shall reduce our revenue, and how we shall cease to reduce our debt, which we have diminished some \$1,300,000,000 since the great war closed. I affirm that throughout the great branches of the public service in general the work of the Government is well done, by men who desire to do it well. I appeal to the records of the collection of our revenue; I appeal to the figures of the reduction of our debt; I appeal to the facility with which we borrow money, and to the matchless credit this nation has now in every money market of the world. I appeal in other fields to the general provisions of our Constitution and of our fundamental laws to show that the rule of the country, however imperfect the practice of it may be, is absolute and universal freedom, equality, justice. These things the people worship; these things are in words in our Constitution and laws; they are essentially in the hearts of our people, and toward the perfection of the administration of them we are steadily aiming and marching. I believe in my country; I believe it is an honest country, as honest as ever lived: I believe it is the strongest and freest and best;

and, if I may say it, it has as good a civil service as any other country, or a better one.

"At the same time I am ardently in favor of this bill and measures of this description, to be followed steadily in search of better things. I said, do not let us indulge an idea that we can make a perfect system and eliminate all evils or possibilities of evil. We can lay out some general lines under which the civil service shall be administered, without attempting to fill up the minute details. The more you do that, the more you embarrass the officers charged with the execution of the plan, and the more you relieve them from personal responsibility. I would say generally: 'Within such and such lines you shall conduct it. We do not tell you what you shall do in this, that, and the other minute affair, because the duties and proprieties will vary in each of these cases; but we hold you, the President, or this Cabinet officer, or that chief of a minor bureau, or the head of a post-office or custom-house—we hold you responsible for the thorough administration of all affairs under you under these general rules.'

"Sir, I think perhaps the most perfect human machine in the world is a regiment fully organized, with ranks full, and fully equipped. For every duty there is a man; for every man there is a duty, well graded, well related. If every man but half tries to do his duty there is no more charming movement in the world, not even that of the finest chronometer, than that of a regiment; and the essence of military organization—which military organization we are not expected to copy in civil affairs, but which nevertheless can teach us a great deal—one of the essential things of it at least is the responsibility of chiefs. The general of division or of a corps rides through a camp and perceives one regiment perfect in the performance of duty; another slovenly, dirty, with ill-regulated ranks and ignorant of duty. He does not stop to rebuke individual men. He rides back to his tent and sends word to the colonel, and that colonel makes that a better regiment speedily or he goes.

"In general analogy to that must be any good system of civil service which we shall impose, for if you attempt to tie the hands of the chief of a bureau or the chief of a department in the civil service against removals and against what you may choose to call punishment, and against some control of promotion also, just to that extent you relieve him from responsibility; just to that extent you fortify the subordinate against him, and he will encounter insolence and negligence and freely-expressed criticisms and defiance. I think no man who has had military experience would consent to take charge of a bureau of 100 persons without having something of the power of prompt removal and promotion vested in his own hands. This bill does not seek to remove those entirely, by any means.

"It is said that the President has power to do what we propose to do here. So he has,

substantially. He has it, I might say, generally and without reference to any particular statute, from the fact of his being the Chief Executive, from the general provisions of the Constitution. And we put into the statute-book in 1871 (see section 1758) these words:

"The President is authorized to prescribe such regulations for the admission of persons into the civil service of the United States as may best promote the efficiency thereof, and ascertain the fitness of each candidate in respect to age, health, character, knowledge, and ability for the branch of service into which he seeks to enter; and for this purpose he may employ suitable persons to conduct such inquiries, and may prescribe their duties, and establish regulations for the conduct of persons who may receive appointments in the civil service.

"Under that provision the President might, perhaps, do nearly all that one can here require or expect the executive department to do; but the difficulty is that it is almost impossible to do these things with the tacit and yet actual opposition of the leading body of political men in the country, and without the cordial sanction of Congress. For two years Congress gave Gen. Grant the money necessary to conduct a reform in the civil service, to pay his commission, etc., and then he asked for it in vain three years in succession. He abandoned the effort, saying frankly to Congress that if this work was not sanctioned by the vote of the legislative body, if the country really did not demand it, he should be obliged to surrender his efforts. And yet in the report made in that very year by the able civil-service commission these points are considered as established by their two or three years' practice. I have no doubt they were, because here in my hand is the volume of testimony (Report 576) given before the committee of which I have the honor to be chairman, during the last session, largely from the custom-houses of New York, Boston, and Baltimore, and the post-office of New York, and it shows that similar results are attained to-day. These are the results the civil-service commission claimed to have reached, and in Gen. Grant's message of April 18, 1874, the statements were adopted with the specific approval of the Cabinet, as the message asserts:

"1. They have, on an average, where examinations apply, given persons of superior capacity and character to the service of the Government, and have tended to exclude unworthy applicants.

"2. They have developed more energy in the discharge of duty, and more ambition to acquire information connected with official functions on the part of those in the service.

"3. They have diminished the unreasonable solicitation and pressure which numerous applicants and their friends, competing for appointments, have before brought to bear upon the departments in the direction of favoritism.

"4. They have, especially where competition applies, relieved the heads of departments and of bureaus, to a large extent, of the necessity of devoting to persons soliciting places for themselves or for others time which was needed for official duties.

"5. They have made it more practicable to dismiss from the service those who came in under the civil-service examinations, when not found worthy, than it was or is to dismiss the like unworthy persons who

had been introduced into the service through favor or dictation.

"6. They have diminished the intrigue and pressure, before too frequent, for causing the removal of worthy persons for the mere purpose of bringing other, perhaps inferior, persons into the service.

"For these reasons the committee on this subject has reported in favor of continuing it. I have indicated our reasons for proposing a bill to vindicate and strengthen the Executive in carrying this reform into practical effect. And here is the bill."

Mr. Hoar, of Massachusetts, also advocated the passage of the bill. He said:

"Unless I much mistake the signs of the time, the country and Congress are now agreed in support of this measure. We are to be congratulated even upon some of the events which have taken place recently, much as we may have originally disapproved them, in so far as they have tended to bring about so much unanimity between the different political parties upon this question. From the necessity of the case, no reform in the civil-service administration of the country which takes it out from the domain of politics can ever be permanently accomplished to which both of the great parties in the country are not committed. From the necessity of the case, the party which has been in the minority, and whose opponents have possessed the administration, must, when these measures are accomplished, entitle itself to the respect and confidence of the country by a considerable act of immediate self-denial.

"Under the present system the civil service of the country is made up, and always will be made up, largely of the adherents of a single political party, and if the opponents of that party are so short-sighted as to admit that the principal object of their existence is to displace their political opponents and to gain those offices for themselves, by resistance to any well-considered scheme of reform in this particular, the evil will never be overcome. One half, or nearly one half, the American people are asked to indicate and emphasize their patriotism and their fitness for the administration of the country by denying and disdaining the use of a weapon of which they have felt the edge and the weight for many years. There is no doubt of it. It has got to be met; and unless there be statesmanship enough, and confidence in the capacity of the American people to recognize and to reward statesmanship enough, to waive that objection, the evils which now exist and prevail must be taken to be incurable.

"I think we are to be congratulated upon the indication of so far substantial unanimity in the passage of this measure, that the gentleman whose name is connected with it is an honored and distinguished leader of one side, that the chairman of the committee which reports it is an honored and distinguished leader on the other side, and that a President of the United States not identified heretofore specially in the public mind with this reform, promises in advance to give his signature and his

support to the measure if Congress shall agree upon it.

"When the Senator from Ohio (Mr. Pendleton) addressed the Senate, the other day, he directed some very eloquent and very severe reproaches against the Republican party. These reproaches were by no means wholly undeserved. They ought to be met not by counter-reproaches, not by undertaking to show by way of set-off similar conduct, or similar misconduct, on the part of his party, but by admitting and conceding the fact that this system which has come down to us from the very origin of party government in this country has gone on, sometimes operating better and sometimes operating worse, until it has reached a point where some of the abuses to which it is liable have excited the attention of the American people and caused a demand for their reform.

"When Mr. Jefferson came into power in 1801, as I said the other day, he encountered the same condition of things that the Democratic party encounters to-day. He declared that he found the civil offices of the country filled without an exception by the opponents of his administration, and he was obliged to hold back a wave and torrent of indignation from his own associates, demanding the use of the civil service of the country to establish its party in power. I have upon my desk here the correspondence between Mr. Jefferson's Attorney-General and himself with regard to the appointments in the State of Connecticut, in which a large committee of leading Connecticut Republicans set forth the political proscription under which they have labored for the past twelve years, during Adams's and Washington's administrations, at the hands of the Connecticut Federalists, and recommending the exercise of the President's power of removal to cure that condition.

"Mr. Jefferson replies in one letter he thinks the Connecticut Federalists will find that he can be as intolerant as they can; in another he proposes to exercise the power of removal in regard to all United States district attorneys and marshals and to stand at the porch of the courts; in a third, that he proposes to turn out all the men who sympathize with Hamilton and the Essex junta, whom he regards as incurable, fit only for a mad-house; and in another that he shall regard activity in the late revolution (that is, the revolution which had placed him in power) as a good reason for a political appointment, and activity on the other side as a good reason for a political removal. He says that he advises his correspondent to give him a list of the obnoxious Federalists in his State, and 'leave the rest to me.' When these things are done, and the Republican party—as it was then called, the Jefferson party—has attained its fair and just proportion of the civil offices in the country he hopes then, and it is in that connection he uttered his famous sentence, to be able to inquire, as to the person to be ap-

pointed to office, 'Is he honest, is he capable, is he faithful to the Constitution?'

"I will have the letter of Mr. Lincoln, Attorney-General of the United States under Mr. Jefferson, placed in the 'Record,' so that it may be read by the Senate and by the public without my reading it. The Attorney-General recommends to Mr. Jefferson that he shall not make all his removals at once, because, he says, that will make all the officers removed and all their friends unite in opposition to his administration; that he had better remove by degrees and let the process extend over a year or two, because then the first batch will be the only ones that will complain, and those who are left, with their friends, will stand by the Administration, thinking they are to escape.

"So that it is an entire injustice to say that when Mr. Marcy, under Jackson, made his coarse and well-known statement, that 'to the victors belong the spoils,' he was introducing for the first time this vicious system. He was avowing not a new system, but was frankly stating a system which had so far preceded the accession of Mr. Jefferson to power in 1801 that when he came in he did not find, he said, a single one of his political associates in office.

"As I said, the thing which the Democratic party is asked to do in giving its assistance to this measure is an immediate and present sacrifice for the permanent and enduring welfare of this country, and the question of its fitness ever to be trusted with administration will in my judgment be very largely determined by the American people at some time in the future as it shall itself decide this question.

"It is, I think, fairly to be said in extenuation (if it were desirable to enter into an extenuation of the conduct of those who have been charged with administration in this country) that it is only within a very recent period that there has been any substantial and adequate support in public opinion of this reform. President Grant entered upon the administration of the Government on the 4th of March, 1869, in my opinion penetrated with an earnest desire to elevate the civil service of the country not only above corruption but above party. The first important political event of his administration was the warfare of the leaders of this body when he attempted to construct the Circuit Court of the United States in favor of their claim to exercise their patronage and to control the Executive in that particular.

"Again and again down to 1874 President Grant urged upon Congress the necessary appropriation and the necessary legislation to enable him to elevate the civil service of the country above party. The result is shown in President Grant's message of 1874, an extract from which, I think, was read by the honorable Senator from Connecticut. If so, I shall not read it again. In it President Grant declares that he shall regard the refusal by the legislative power of the continuance of the small appropriation of \$25,000 in aid of his measure

as a final judgment by Congress against its expediency, and gives notice that he should thereafter abandon the attempt.

"Now, the time has come when these two belligerents are asked to agree to disuse in our political conflicts hereafter an instrument of warfare which has been so injurious to the public interest hitherto. We wish if we can now, taking advantage of the present earnest condition of public sentiment, excited on this subject, to stereotype these expressions of public opinion into a statute which may be permanent.

"Mr. President, I expect to support the bill of the committee, and, without entering upon the details which have been so much discussed, and which will be discussed further I dare say, I expect to support it for these reasons: First, that it is the measure agreed upon by the large majority of persons who have made special study of this cause. I do not propose to surrender to any man or to any body of men the prerogative or the duties of the members of this body; but I think in discharging our duties, taking upon ourselves as we must the ultimate responsibility of every measure, it is proper that a large respect should be had for the opinion of those persons who have specially studied for years the evil which we are seeking to remove, who have specially studied the proper remedy, and to whose efforts the existing public sentiment on the subject is largely due.

"Next, the bill commends itself to my judgment because it proceeds with a statesmanlike caution in making the necessary experiment and proceeding from step to step. It is applicable to only a few of the great public offices in the country besides the seven departments existing in the city of Washington. It applies, I think, to about thirty offices only out of Washington and to the departments here, and it permits the President, if he see fit, to extend gradually, as experience shall warrant, there being full opportunity for the legislative power to amend or supply any defects in this bill hereafter, until finally, if it is found expedient, it shall embrace the entire civil service of the country so far as it can be properly applied.

"Again, it is a measure justified by experience in the great offices at New York, and to some extent in Boston and in the Department of the Interior here. It is difficult to raise a practical objection to any detail of the bill to which an answer is not found in the reports of the experience of Mr. James and Mr. Pearson in the post-office in the city of New York. Every public officer to whom there comes any responsibility in putting on trial this scheme becomes a convert to its practicability and its wisdom. Every public officer under whose administration this scheme is permanently enforced becomes, as the months and years go by, a more enthusiastic and emphatic adherent of this plan.

"The measure commends itself to me also

because it carefully and wisely avoids all the disputed constitutional questions which have been raised in the discussion of this subject. It nowhere trenches upon the constitutional power of the President under any definition or limitation, even the largest and broadest, of the executive powers which is to be found in our constitutional discussions. The President's right to make rules, to apply rules, to change rules, the President's responsibility growing out of his constitutional duty to see that the laws are faithfully executed, are not impaired, and in my judgment can not be impaired by legislation. I do not understand that it has been the purpose of the honorable Senator from Ohio in reporting this bill in any degree to infringe upon the constitutional prerogative of the Executive.

"It does not assert any disputed legislative control over the tenure of office. The great debate as to the President's power of removal, the legislative power to establish a tenure of office with which the President could not interfere, which began in the first Congress, which continued during the contests of the Senate with Andrew Jackson, revived again at the time of the impeachment of Johnson, and again in the more recent discussion over the Tenure-of-Office Bill in the beginning of the administration of President Grant, does not in the least become important under the skillful and admirable provisions of this bill.

"It does not even (and that is a criticism made upon it, but in my judgment it is one of its conspicuous merits) deal directly with the question of removals, but it takes away every possible temptation to improper removals. What Executive, what head of a department, what influential public man anywhere can seek in the least to force a worthy and deserving public officer from his office merely that there may be a competitive examination to fill his place—to fill a place at the bottom of the list, not to fill his place, as is well suggested?

"Now, Mr. President, while this avoids the use of any doubtful constitutional power or mechanism to create a removal, it, as I have said, cures the great abuse which has existed recently by removing the temptation to an improper removal. In my own judgment the abuse of improper, cruel, and unjust removals of worthy and deserving public officers is an abuse almost or quite equal to the other against which this bill directly aims, the use of the civil service of the country as a political instrumentality.

"I congratulate the Senator from Ohio, I congratulate the Senator from Connecticut, I congratulate the country, on the auspicious circumstances under which this bill has been presented; and, whatever else may happen, I believe if this system shall be inaugurated now, the session of this winter will be one of the marked and conspicuous eras in the political history of the country, as the time when the two great political parties were willing, under

the spur and excitement of an aroused public opinion, to unite in laying down for the permanent welfare of the country a weapon of offense and of defense which had come down to them from the past, and whose present use in the immediate future might seem to be so convenient. I believe the adoption and inauguration of this scheme, if it shall prove successful, as I confidently expect, will be regarded in the future by the American people almost as the adoption of a new and a better Constitution."

Mr. Brown, of Georgia, opposed the civil-service reform vigorously. He said: "I admit it is very important that there be a better system of administration inaugurated than we have had for many years past. I do not think, however, that the bill now before the Senate, if passed, will inaugurate any such system. I think it will prove a mere delusion. If we pass it we excite popular expectation, and popular expectation will be greatly disappointed in the workings of the system. I have heard the British system spoken very highly of; many eulogies passed upon it. It has been said by advocates of this bill—probably not on the floor, but again and again outside of the chamber—that we should adopt something similar to that system, if not the exact system itself.

"Now, Mr. President, the forms of the two governments are entirely different, the circumstances are different, and the surroundings are different. The system that may work well there in a limited monarchy, the policy of which is to maintain an aristocracy, even a landed aristocracy, is not appropriate to a republican form of government like ours.

"In Great Britain the executive is hereditary. The incumbent derives his right, not by election of the subjects or citizens of that country, but by birthright. The upper house of the British Parliament is not elected, but those who occupy seats there, unlike this body, are dependent upon the accidents of birth for them, not upon any special merits or personal qualifications that they may have, but the duke takes his seat because he is the son of the former duke.

"That is not our American system. It is very consonant, however, with that system to adopt a civil-service rule that, while the executive is for life and hereditary and the higher branch of the legislative department holds for life and is hereditary, will make the subordinate officers hold for life. I say it is consistent and compatible with that system. It is not so here. Under our republican system no man takes anything by hereditary right, but the way is open to the son of the humblest peasant within the broad limits of our domain, if he has merit and energy and ability, to occupy the highest position in the Government. Our theory is that men are to be promoted on account of merit and qualifications. It may not always be carried out—of course it can not always be—but that is the nature of the sys-

tem and that is the general practice. It is compatible, therefore, with that system to leave the changes in the legislative department, in the executive department, and in every department except the judicial, to the frequent mutations of parties and to the supposed merits of the competitors who compete for the prizes. In all the departments, legislative and executive, qualification is supposed to be looked to. Election of Representatives and the higher officers is the general idea. Why in the face of that should we establish for the subordinate officers in the different executive departments and in all the larger offices within the limit of the United States a system of lifetime tenure for the very large class of persons who fill those places? I say it is not compatible with our very form of government. It is one step in the direction of the establishment of an aristocracy in this country, the establishment of another privileged class.

"It may be said, however, and I believe that sentiment was uttered only a few days ago, though not in the language I use, probably, that it takes away from persons who hold these positions the inducement to be active politicians. In some cases that might be the working of it; but bear in mind, Mr. President, it leaves it in the power of every one of them to become an active politician, and if the spirit of the system is carried out as claimed by the Senator from Massachusetts (Mr. Hoar), the officers can be as active as they choose on one side, and one side alone, and run no risk of losing their positions. It builds up a powerful class supported out of the Treasury of the United States, out of the taxes of the people, and places in their hands the power, if they choose to exercise it—and there is a great deal of human nature in man, so that they probably would exercise it—the power to do much to control the future rulers and destinies of this Government.

"I am not very fresh from my reading of Roman history; but as I recollect it there was a period in the history of that government when it became necessary to establish the prætorian guard to protect the ruler against the populace. It would naturally enough have been claimed that that guard would take no part in the politics of Rome, and yet in the workings of time that prætorian guard became the master of Rome and assumed control of the government. As they protected the sovereign, they dictated who should be the sovereign, and for a large enough amount of money they would displace one sovereign to make room for another. How do we know that we may not build up a similar class here when we build up a lifetime aristocracy in office, or when we establish a lifetime tenure of office? It is contrary to the very genius and spirit of our Government.

"If there be really in the popular mind a demand for any such bill as is usually termed civil-service reform, it is a bill to make perma-

nent the positions of those who hold offices, to confine removals to cause alone. The class who ask for it, I think, are a very small minority of the American people. At the same time they ask for it in that spirit and with that purpose, and they would consider themselves mocked if this bill is passed containing no protection for the incumbents against removal without cause. What good does it do as a measure of reform if the power of removal is unlimited and without cause at the mere will or whim of the appointing power? The civil-service reformers who are most clamorous for action, and who are in earnest about the matter, would consider such a measure, if that is all it means, as a trick, a sham, a delusion.

"But it requires a competitive examination, say the Senators on the other side, before you put a man into office. There again the bill is a cheat and a mockery. It does no such thing in spirit and substance. For fear there might come a day when a Democratic Executive would administer the affairs of this Government, and that day might not be very distant, there is a careful provision in this bill that it shall apply only to the lowest class who are to hold office. There shall be a competitive examination for the lowest grade only; that is free to all; and the Senator from Massachusetts who took his seat a few minutes ago very earnestly stated that that was one of the strong features in it.

"Now, I believe that there is a very large number of employes in the departments at present, occupying different positions in them, some of them high positions, who are not fit for those places, morally, intellectually, or in any other manner; but the charmed circle is not to be disturbed. If there chances to be one of the lower clerkships vacant, then the doors are thrown wide open by this bill and every American citizen may come up and compete for it. It will not do to go higher than that, for too many Democrats might get in. You Democrats can come up and compete for the lowest clerkships that are to be filled; but if a vacancy occurs above that, then the Republican employes and officers already in office, and they alone, can apply for the advancement or promotion. That is the civil-service reform that this bill gives to the country; that is the share that the Democratic party gets in it. I repeat it, under the provisions of this bill the competition is only general for the lowest office that can become vacant. There a Democrat stands a chance to get in this lowest position, but if fifty vacancies occur above it only the present incumbents, the Republican office-holders, can compete for the promotion. That is what it holds out to the Democratic party. That is our share in its benefits.

"Now, I am going to talk plainly to Democrats. It is not required for us to mince words here, for the country very well understands this whole question. The Republican party have had the offices of this Government for

the last twenty-two years consecutively. The Executive has been Republican, and they have had the distribution of the offices and places. They still have it. True, an avalanche has swept over the country, and with it the strongest condemnation of the practices of that party. It is true this was in the off year, and not the presidential year, but prudent, sagacious men on the other side of the chamber understand this as well as we do on this side. If we make no great blunders—and I know I have heard it said on the other side that they rely a great deal on Democratic blunders, for we sometimes make them—unless the Democracy is guilty of great folly on some important questions there can be, to my mind, and I think to the minds of Senators generally, but little doubt that the next President of this republic will be a Democrat.

"I am speaking now to Democrats. How do you go into that campaign? Suppose you put my honorable and worthy friend from Ohio (Mr. Pendleton), or my honorable friend from Delaware (Mr. Bayard), or any other one of the prominent and able gentlemen mentioned for the place, in nomination for the presidency, and you go before the Democratic masses of the United States and tell them that you are handicapped; that all the offices that amount to anything, the higher and more important places, are already disposed of. 'Disposed of how?' they will inquire. 'Why, the Republican party have had them for twenty-two years, and seeing that there was a probability of a change of administration—to put it in no stronger light—they have hedged, and they have taken good care of themselves; they have passed a civil-service bill and Democrats have helped them to enact it; and we have it on the statute-book now that there is no Democrat to be put into office in any of the executive departments except in the lowest positions. Above them the Republicans alone may compete with each other for the places; but there is no chance for a Democrat.'

"In a free republican government like this those who belong to both parties fight for office as well as principle. Do you believe that the Democratic leaders in all the different States would work with the same energy, and zeal, and ability as they would if you held out to them a chance of a change of the offices, with the change of the Executive? It would be contrary to all the history of the past to expect any such work.

"I know it has been replied to this that the Democratic candidate would not likely have so strong opposition from the Republican office-holders in office. I have no faith in that. The Republican office-holders are usually ardent, true Republicans; they believe in the principles and practices of their party, and they want to promote and perpetuate them, and they believe that that party has a sort of divine right to the offices of this Government, and they will be as true to their party in the campaign

as the needle is to the pole, while you deaden the energies of the Democratic leaders from the lowest to the highest by taking away any inducements you would otherwise hold out to them to fight with the view of reaping any of the rewards of success. They would vote the ticket patriotically as true Democrats, but they would not exert themselves as they would do if they believed there would be a general change, or even a change of one half the persons holding the offices.

"I say, then, take it any way you will, I do not see, with great deference to my friend from Ohio, why at this time a Democrat should vote for this bill; certainly not without important amendments, that destroy the aristocracy of Republican office-holding that this bill provides for. Will Democrats vote for it when it closes the doors of the competitive examination against Democrats for every position except the very lowest? I do not wonder that our Republican friends are very unanimous, and very anxious at this time for the passage of this bill. The only wonder I have is that it has taken them so long to reach this point. The first four years when they were in power were years of war. It was then no time to discuss civil service.

"Perhaps the next two or three years ought not be counted, during the stormier period of reconstruction; but take off six years from twenty-two and it leaves about sixteen years of peace, when Senators and Representatives were in condition here to consider the best interests of the whole country. It has taken them sixteen years to reach the point of, as they consider, a real civil-service reform. Well, now, to show the humbuggery in this whole affair, there was a very good civil-service statute put upon the book some years ago when Gen. Grant was President, and the law was not only enacted but the machinery was provided. The three commissioners—I believe three was the number—were appointed. As is contemplated by the act, they went to work; civil-service reform, it was said, was going to be given to the country then. Broad plenary powers were given to the President. There were some very patriotic and able gentlemen, too, on the commission. One of them was from my own State, Judge D. A. Walker, an honored name, a worthy gentleman, a true Republican. They worked and did, no doubt, the best they knew how; and what real substantial reform did the country see? It became so much of a mockery that Congress in a few years afterward refused to appropriate the salaries of the commissioners. It was seen to be a deception and a fraud in practice, whatever might have been intended and however sincere President Grant might have been in his purpose to carry it out in good faith. It failed. It was an inglorious failure; and matters went on as matters will go on in this Government.

"This is a republican government; it is

democratic in form, and you have to change the nature of the government and change human nature also before you will be able to adopt in practice here any Utopian theories about civil service.

"I do not laud the sentiment mentioned by the honorable Senator from Massachusetts, which he attributes to Mr. Marcy, that 'to the victors belong the spoils.' He said it was rather coarse. Probably it was; but yet to a very great extent it has been the system practiced from the first day of the inauguration of this Government: and whatever you may put upon the statute-book it will be the system practiced until its funeral-knell is sounded. And no party in this Government ever practiced the spoils system with more zeal and energy than the Republican party has. 'To the victors belong the spoils' has been its constant motto in practice; and still would be, if impending defeat did not stare it in the face. There may be some reforms, some of the worst features may be cut off; but in the main the Executive who comes into power when his party has long been deprived of power will find a way, and the heads of departments under him will find a way to give to his followers the benefit of the offices or a large proportion of them.

"I say the argument is legitimate, that, give the measure all you claim for it, then as Democrats you should not vote to handicap your candidate, and you should not vote to retain in office for life those who have held the positions for so long a time, and who are your political enemies. But if it is not true that it will be executed or that it amounts to anything, then this is a vain business in which we are engaged, and we had better spend our time in something that is of some practical utility.

"The preamble of this bill promises very finely. I desire to read it:

"Whereas, common justice requires that, so far as practicable, all citizens duly qualified shall be allowed equal opportunities, on grounds of personal fitness, for securing appointments, employment, and promotion, in the subordinate civil service of the United States.

"That is very broad. It would seem to be a very good doctrine. But I confess I was struck when I looked further over and saw that in the very teeth of that recital of the proper principle the competitive examinations are limited to the lowest grade of offices. That means, I suppose, that it is justice in case of the lowest grade to give everybody a chance; but above that the benefit must be confined to the inner circle, those who have held office a long time and want to continue to hold it; in other words, to Republicans.

"Again, the preamble says:

"Whereas, justice to the public likewise requires that the Government shall have the largest choice among those likely to answer the requirements of the public service.

"That is good doctrine, but the body of the

act is in the teeth of it. The Government should have the largest choice among those likely to answer the requirements as to qualifications for office, and yet you limit the choice of the Government in the body of the bill to the lowest grade.

"Again:

"*Whereas*, justice, as well as economy, efficiency, and integrity in the public service, will be promoted by substituting open and uniform competitive examinations for the examinations heretofore held in pursuance of the statutes of 1853 and 1855.

"Economy, efficiency, and the integrity of the service will be promoted, says the preamble, by substituting competitive examinations, and yet the body of the bill denies the competitive examination, so far as the public generally are concerned, to all persons except for the lowest grade of offices. But reference has been made here to the letter and doctrines of Mr. Jefferson on this question. He has been cited as authority, and he is very high authority on any subject that he ever handled. There are certain expressions in his letter to Mr. Lincoln that are warped to mean that removals should take place for cause only, and that qualifications and fitness alone should be looked to. Mr. Jefferson made very important qualifications of that doctrine in that letter. I propose to read a portion of it. He speaks of the action of the leaders of the Federal party at that time, and says (see his letter to Levi Lincoln, dated 25th of October, 1802, vol. iv, Jefferson's Works, page 450):

"They are trying slanders now which nothing could prompt but a gall which blinds their judgments as well as their consciences. I shall take no other revenge than by a steady pursuit of economy and peace, and by the establishment of republican principles in substance and in form, to sink Federalism into an abyss from which there shall be no resurrection for it. I still think our original idea as to office is best; that is, depend for the obtaining a just participation on deaths, resignations, and delinquencies.

"But Mr. Jefferson says more than that:

"This will least affect the tranquillity of the people and prevent their giving in to the suggestion of our enemies, that ours has been a contest for office, not for principle. This is rather a slow operation—[and if he had been confined to the lowest grade of office alone he would have thought it a great deal slower]—but it is sure if we pursue it steadily, which, however, has not been done with the undeviating resolution I could have wished.

"Mr. Jefferson only waited for deaths, resignations, and delinquencies. When these came, a Republican, as the Democrats were then called, was to be put into office. He declares that was very slow. And what does this bill do? It waits in the same manner for deaths, resignations, or delinquencies, but only in the lower grades. It does not give us the chance of putting in a Democrat in every grade that becomes vacant, because the competitive examination must be from those in office at the time; for all above the lowest grade. It confines us to the lowest grade. What would Mr. Jefferson have said if there had been an

attempt to confine him to the lowest grade in filling offices where vacancies occurred in the manner already designated? He would have thought it was a great deal slower than the slowness of which he complained.

"Again, he said:

"To these means of obtaining a just share in the transaction of the public business shall be added one other, to wit, removal for electioneering activity.

"What would he have said to the hundreds of clerks who are given time when elections come on to go to Ohio, and the extreme limits, wherever there is a Republican State, to take an active part in controlling the State elections? Would he not have swept the last one of them from office? He adds 'Or open and industrious opposition to the principles of the present Government, legislative and executive.'

"If they took an active part in politics against him, or if they were open in opposition to the principles of the party in power administering the Government, they were to go by the board. Hear him again:

"Every officer of the Government may vote at elections according to his conscience; but we should betray the cause committed to our care were we to permit the influence of official patronage to be used to overthrow that cause. Your present situation will enable you to judge of prominent offenders in your State, in the case of the present election.

"'Prominent offenders in your State.' That is, those who had taken a prominent part against his party in Connecticut. That was what he meant, and it would be left to Mr. Lincoln to judge of those who had been prominent in that way. Then he adds, 'I pray you to seek them, to mark them, to be quite sure of your ground, that we may commit no error or wrong, and leave the rest to me.'

"He was President and said: 'Seek them; mark them; be quite sure of your ground, and then leave the rest' to him; he would take care of it. Again he says:

"I have been urged to remove Mr. Whittemore, the surveyor of Gloucester, on grounds of neglect of duty and industrious opposition. Yet no facts are so distinctly charged as to make the step sure which we should take in this. Will you take the trouble to satisfy yourself on this point? I think it not amiss that it should be known that we are determined to remove officers who are active or open-mouthed against the Government, by which I mean the Legislature as well as the Executive.

"Mark his language. He thought it not amiss that it should be known that they were determined to remove from office those who had been active and open-mouthed against the Government whether in the legislative or the executive department. That was the sort of civil service that Mr. Jefferson advocated; that was the advice he gave to his friend Lincoln, of Connecticut; and mind you, he says, 'Mark them, and leave the rest to me.' And so it will be, no matter what civil-service bill you may pass; whenever the President and the heads of departments desire to do so, they will mark them, and they will find a way of getting rid of them.

"Now, Mr. President, one word as to the natural inherent justice of this case aside from all political views of it, or any partisan view; what is right, what is just. According to this preamble, it is right and just that men should take their chances in procuring office, and have a fair chance in accordance with their ability, their intelligence, and their fitness for the place; all tax-payers and all citizens should stand upon grounds of equality, taking chances alike, with no favored class and no proscribed class.

"What is the state of things in this republican Government of ours? There are now, it is said, about 55,000,000 people; there are about 110,000 officers and persons holding employment under the Government, and those places are held by Republicans almost invariably. It is true the Senator from Massachusetts told us a while ago that the President of the United States now stands pledged to sign and support a measure for civil-service reform. Why does he stand so? What new-born idea has put him on that platform? I speak kindly of him personally, for I have great regard for him; but his political course we have a right to discuss. What administration, at any time since the foundation of this Government, has ever been more proscriptive, so far as appointments to office are concerned? How many Democrats has he left in, holding offices of any importance? Some of his predecessors were more liberal on that subject. But when he came in I presume those having influence required of him that he should make a clean sweep, and he has made it as near as any administration ever can.

"What, then, is the modest proposition here? It is to give to the Republican party, according to the theory of the advocates of the bill, especially the theory of the Senator from Massachusetts, a permanency in these offices. What is the Republican party of this country? It is a minority of the people of this country. In 1876 Samuel J. Tilden was elected President of these United States, and he got a popular majority of about 250,000. In 1880 James A. Garfield was legally and constitutionally elected President of these United States, but he was elected by a plurality only; adding the Democratic vote and the Greenback vote together, he was beaten on the popular vote by over 800,000 majority. The Republican party, then, are a minority of the people of the United States, and yet they hold to-day almost all the offices connected with the Government of the United States. Is it right, Mr. President, as a naked question of justice, equity, and fair play, that this state of things should continue? They have had this advantage for twenty-two years. How long has this minority a divine right to govern this country?

"No, if we are to have a just and equitable civil-service reform, let it be a reform of the abuses of the party that has so long wielded the power of the Government, and let that reform be put upon the basis that in future

competitive examinations, when you ascertain the two highest, the Democrat shall be preferred until one half the office-holders are Democrats. I can see an equity in that; not if you confine it, however, as this bill does, to the lowest grade of officers; but if you will throw all the offices in these departments open to competition when vacancies occur, and then take the two highest and give the preference to the Democrat until the Democrats have half the offices, there is something like a just and equitable civil service. You would have to give the Greenback party some portion; but I am willing to meet this question anywhere upon the equity and justice of the case. I do not fear to go before the populace upon it, and say that I do not favor this policy of civil service, because of its injustice, its inequality, and its want of equity. The Democrats perform their part of the duties and bear their part of the burdens of this Government; they pay their portion of the taxes; they do their part of the military service; in a word, they do faithfully the duties incumbent upon citizens.

"Why is it, then, that they should be proscribed not only for the long period, when it has already been so, but for all future time? Why are they not worthy of their part in the patronage and offices of the Government if they bear their part in the burdens of the Government? Will some Senator who is so anxious for this civil-service reform please tell me why it is that the Democrats have no equity, no rights as a class? I know it has become popular to prate about civil-service reform. We have had it in Presidents' messages and in reports of heads of the departments until it is in everybody's mouth, and yet how delusive! In practice it amounted to nothing from the very commencement, and now this bill proposes to make it an engine of inequality, injustice, and wrong to the larger half of the tax-payers and voters and people of the United States.

"I will give my sanction to no such measure, and if no other man in this chamber votes against it I will pride myself in recording my vote against a measure that proscribes a majority of the people of the United States, with which majority I act, and drives them from public positions for almost a generation to come, opens the way to the lowest grades that we may come into the lowest positions only, and leaves the balance to those already in, who are all Republicans. I treat it on its equities, I treat it on its justice, and denounce it as unfair, as fraught with wrong, injustice, and inequality, and I ask any one who can to defend it as a principle of equity. If the Democracy had been twenty-two years in power, and had the control of the offices and patronage of this Government, I say to my colleagues on this side you would hear a different voice from the other side, in my opinion; I think they would see, and have no difficulty in reaching the con-

clusion, that the bill was unjust, unequal, and ought not to pass.

"But there is another provision in connection with this bill which may require some attention. The country has been greatly shocked by the practices of the Republican party, by their levying assessments upon subordinates in the various offices of the Government to be used for political purposes, and both sides seem now to agree on the propriety of enacting stringent laws against such a practice in future. In other words, we propose in future to make it highly penal, if not a penitentiary crime, for any officer or committee to do what the Republican committee did in the last campaign. And while I deny that the great majority of the people of the United States have either clamored or called for a civil-service measure of the character contemplated by this act, I admit that there is a general demand for the enactment of a law to punish, and punish severely, the practice of soliciting and virtually compelling donations of part of their salaries from subordinates in the different departments. But why pass a civil-service bill of the character of this to get that provision into it? Why not meet the question fairly and squarely, like bold, sensible men, and amend the penal code of the United States by the enactment of a law providing ample punishment for those who practice this system in future? No civil-service bill is necessary. It wants a penal statute to make the infamous practice a high misdemeanor, if not a felony. Those who claim that the people at the last election not only condemned the corrupt methods and practices of the Republican party, but that they demand the so-called civil-service reform contemplated by this bill as a remedy, make a great mistake. The corrupt practices have been condemned. The people have spoken in thunder-tones of condemnation and denunciation, which can neither be ignored nor misunderstood. They denounce the admitted malpractice of Republican officials, and demand a remedy. But what remedy? Not that we pass a law to continue the perpetrators of these great wrongs in office for life or a term of years. The party to which they belong has held power twenty-two years. It is time there was a change. And the people demand, as a remedy for existing abuses, a change of officials. They demand that the unfaithful public servants, whose maladministration can not be denied, be hurled from power, and that their places be filled by honest, capable men, who will reform the public service by a return to the purer and better methods practiced by the fathers of the republic; who will cut off all surplus and unnecessary officials, clerks and employés; and all extravagant waste of the public treasure, which is wrung by taxation from the labor of the people."

Many Senators participated in the debate on the passage of the bill; but the discussion, though long, was not interesting, and frequently degenerated into partisan recriminations.

Senators Voorhees, Vest, and Cookrell, especially took occasion to bring out the record of the party in power, in contrast with the principles of the measure. The bill finally passed the Senate, Dec. 27, 1882, by the following vote:

YEAS—Aldrich, Allison, Anthony, Bayard, Cameron of Pennsylvania, Cameron of Wisconsin, Cockrell, Coke, Conger, Davis of Illinois, Davis of West Virginia, Edmunds, Frye, Garland, George, Gorman, Groome, Harrison, Hawley, Hill, Hoar, Jackson, Jones of Florida, Jones of Nevada, Lamar, Lapham, Logan, Miller of California, Miller of New York, Morrill, Pendleton, Platt, Plumb, Rollins, Sewell, Vest, Walker, Windom—38.

NAYS—Brown, Call, Jonas, McPherson, Morgan—5.
ABSENT—Barrow, Beck, Blair, Butler, Camden, Chilcott, Dawes, Fair, Farley, Ferry, Grover, Hale, Hampton, Harris, Ingalls, Johnston, Kellogg, McDill, McMillan, Mahone, Maxey, Mitchell, Pugh, Ransom, Saulsbury, Saunders, Sawyer, Sherman, Slater, Vance, Van Wyck, Voorhees, Williams—33.

In the House, the bill was referred to the select committee on civil-service reform, and reported back without amendment by Mr. Kasson, of Iowa, Jan. 4, 1883. He at once moved the previous question, which was carried, and after a brief discussion the measure passed the House by the following vote:

YEAS—Aldrich, Anderson, Barr, Bayne, Beach, Belmont, Belmont, Beltzhoover, Berry, Bingham, Bisbee, Blanchard, Bowman, Bragg, Briggs, Buck, Buckner, Julius C. Burrows, Jos. H. Burrows, Butterworth, Calkins, Campbell, Candler, Cannon, Carlisle, Carpenter, Cassidy, Caswell, Chace, Clark, Cobb, Sam'l S. Cox, Wm. R. Cox, Crapo, Cravens, Cullen, Curtin, Lowndes H. Davis, Deering, De Motte, Deuster, Dezendorf, Dingley, Ermentrout, Erret, Sewell S. Farwell, Fisher, Flower, Ford, Frost, George, Godshalk, Grout, Guenther, Gunter, Hall, Jno. Hammond, Hardy, Harmer, Benj. W. Harris, Haseltine, Haskell, Hatch, Hepburn, Herbert, Abram S. Hewitt, G. W. Hewitt, Hill, Hiscock, Hitt, Hobbittzell, Holman, Houk, Humphrey, Jacobs, Jadwin, Geo. W. Jones, Phineas Jones, Jorgensen, Kasson, Kelley, Ketcham, Klotz, Lacey, Lewis, Lindsey, Lord, Matson, McClure, McCook, McKinley, Robt. M. Mo-Lane, Jas. H. Mo-Lean, Miles, Miller, Morey, Morrison, Morse, Moulton, Mutchler, Neal, Nolan, Norcross, O'Neill, Payson, Peelle, Peirce, Pettibone, Phelps, Pound, Ranney, Reed, Wm. W. Rice, Rich, D. P. Rice, J. S. Richardson, Robertson, Russell, Scales, Shackelford, Shallenberger, Shelley, Shultz, Simonton, Jas. W. Singleton, Dietrich C. Smith, Spaulding, Stone, Strait, R. W. Townsend, Tucker, Valentine, Van Voorhis, West, White, Morgan R. Wise, Benj. Wood, Young—87.

January 16th the bill was approved by the President. It is as follows:

An act (S. 183) to regulate and improve the civil service of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the President is authorized to appoint, by and with the advice and consent of the Senate, three persons, not more than two of whom shall be adherents of the same party, as civil-service commissioners, and said three commissioners shall constitute the United States civil-service commission. Said commissioners shall hold no other official place under the United States.

The President may remove any commissioner; and any vacancy in the position of commissioner shall be so filled by the President, by and with the advice and consent of the Senate, as to conform to said conditions for the first selection of commissioners.

The commissioners shall each receive a salary of \$3,500 a year. And each of said commissioners shall be paid his necessary traveling expenses incurred in the discharge of his duty as a commissioner.

SECTION 2. That it shall be the duty of said commissioners: 1. To aid the President, as he may request, in preparing suitable rules for carrying this act into effect, and when said rules shall have been promulgated it shall be the duty of all officers of the United States in the departments and offices to which any such rules may relate to aid, in all proper ways, in carrying said rules, and any modifications thereof, into effect.

2. And, among other things, said rules shall provide and declare, as nearly as the conditions of good administration will warrant, as follows:

1. For open, competitive examinations for testing the fitness of applicants for the public service now classified or to be classified hereunder. Such examinations shall be practical in their character, and so far as may be shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the service into which they seek to be appointed.

2. That all the offices, places, and employments so arranged or to be arranged in classes shall be filled by selections according to grade from among those graded highest as the results of such competitive examinations.

3. Appointments to the public service aforesaid in the departments at Washington shall be apportioned among the several States and Territories and the District of Columbia upon the basis of population as ascertained at the last preceding census. Every application for an examination shall contain, among other things, a statement, under oath, setting forth his or her actual *bona fide* residence at the time of making the application, as well as how long he or she has been a resident of such place.

4. That there shall be a period of probation before any absolute appointment or employment aforesaid.

5. That no person in the public service is for that reason under any obligation to contribute to any political fund, or to render any political service, and that he will not be removed or otherwise prejudiced for refusing to do so.

6. That no person in said service has any right to

use his official authority or influence to coerce the political action of any person or body.

7. There shall be non-competitive examinations in all proper cases before the commission, when competent persons do not compete, after notice has been given of the existence of the vacancy, under such rules as may be prescribed by the commissioners as to the manner of giving notice.

8. That notice shall be given in writing by the appointing power to said commission of the persons selected for appointment or employment from among those who have been examined, of the place of residence of such persons, of the rejection of any such persons after probation, of transfers, resignations, and removals, and of the date thereof, and a record of the same shall be kept by said commission.

And any necessary exceptions from said eight fundamental provisions of the rules shall be set forth in connection with such rules, and the reasons therefor shall be stated in the annual reports of the commission.

3. Said commission shall, subject to the rules that may be made by the President, make regulations for, and have control of, such examinations, and, through its members or the examiners, it shall supervise and preserve the records of the same; and said commission shall keep minutes of its own proceedings.

4. Said commission may make investigations concerning the facts, and may report upon all matters touching the enforcement and effects of said rules and regulations, and concerning the action of any examiner or board of examiners hereinafter provided for, and its own subordinates, and those in the public service, in respect to the execution of this act.

5. Said commission shall make an annual report to the President for transmission to Congress, showing its own action, the rules and regulations and the exceptions thereto in force, the practical effects thereof, and any suggestions it may approve for the more effectual accomplishment of the purpose of this act.

SEC. 3. That said commission is authorized to employ a chief examiner, a part of whose duty it shall be, under its direction, to act with the examining boards, so far as practicable, whether at Washington or elsewhere, and to secure accuracy, uniformity, and justice in all their proceedings, which shall be at all times open to him.

The chief examiner shall be entitled to receive a salary at the rate of \$3,000 a year, and he shall be paid his necessary traveling expenses incurred in the discharge of his duty.

The commission shall have a secretary, to be appointed by the President, who shall receive a salary of \$1,600 per annum. It may, when necessary, employ a stenographer and a messenger, who shall be paid, when employed, the former at the rate of \$1,600 a year, and the latter at the rate of \$600 a year. The commission shall, at Washington, and in one or more places in each State and Territory, where examinations are to take place, designate and select a suitable number of persons, not less than three, in the official service of the United States, residing in said State or Territory, after consulting the head of the department or office in which such persons serve, to be members of boards of examiners, and may at any time substitute any other person in said service living in such State or Territory in the place of any one so selected. Such boards of examiners shall be so located as to make it reasonably convenient and inexpensive for applicants to attend before them; and where there are persons to be examined in any State or Territory, examinations shall be held therein at least twice in each year.

It shall be the duty of the collector, postmaster, and other officers of the United States, at any place outside of the District of Columbia where examinations are directed by the President or by said board to be held, to allow the reasonable use of the public buildings for holding such examinations, and in all proper ways to facilitate the same.

Sec. 4. That it shall be the duty of the Secretary of the Interior to cause suitable and convenient rooms and accommodations to be assigned or provided, and to be furnished, heated, and lighted, at the city of Washington, for carrying on the work of said commission and said examinations, and to cause the necessary stationery and other articles to be supplied, and the necessary printing to be done for said commission.

Sec. 5. That any said commissioner, examiner, copyist, or messenger, or any person in the public service who shall willfully and corruptly, by himself or in cooperation with one or more other persons, defeat, deceive, or obstruct any person in respect of his or her right of examination according to any such rules or regulations, or who shall willfully, corruptly, and falsely mark, grade, estimate, or report upon the examination or proper standing of any person examined hereunder, or aid in so doing, or who shall willfully and corruptly make any false representations concerning the same or concerning the person examined, or who shall willfully and corruptly furnish to any person any special or secret information for the purpose of either improving or injuring the prospects or chances of any person so examined, or to be examined, being appointed, employed, or promoted, shall for each such offense be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than \$100, nor more than \$1,000, or by imprisonment not less than ten days, nor more than one year, or by both such fine and imprisonment.

Sec. 6. That within sixty days after the passage of this act it shall be the duty of the Secretary of the Treasury, in as near conformity as may be to the classification of certain clerks now existing under the one hundred and sixty-third section of the Revised Statutes, to arrange in classes the several clerks and persons employed by the collector, naval officer, surveyor, and appraisers, or either of them, or being in the public service, at their respective offices in each customs district where the whole number of said clerks and persons shall be altogether as many as fifty. And thereafter, from time to time, on the direction of the President, said Secretary shall make the like classification or arrangement of clerks and persons so employed, in connection with any said office or offices, in any other customs district. And, upon like request, and for the purposes of this act, said Secretary shall arrange in one or more of said classes, or of existing classes, any other clerks, agents, or persons employed under his department in any said district not now classified; and every such arrangement and classification upon being made shall be reported to the President.

7. Within said sixty days it shall be the duty of the Postmaster-General, in general conformity to said one hundred and sixty-third section, to separately arrange in classes the several clerks and persons employed or in the public service at each post-office, or under any postmaster of the United States, where the whole number of said clerks and persons shall together amount to as many as fifty. And thereafter, from time to time, on the direction of the President, it shall be the duty of the Postmaster-General to arrange in like classes the clerks and persons so employed in the postal service in connection with any other post-office; and every such arrangement and classification upon being made shall be reported to the President.

8. That from time to time said Secretary, the Postmaster-General, and each of the heads of departments mentioned in the one hundred and fifty-eighth section of the Revised Statutes, and each head of an office shall, on the direction of the President, and for facilitating the execution of this act, respectively revise any then existing classification or arrangement of those in their respective departments and offices, and shall, for the purpose of the examination herein provided for, include in one or more of such classes, so far as practicable, subordinate places, clerks, and officers in the public service pertaining to their respective departments not before classified for examination.

Sec. 7. That after the expiration of six months from the passage of this act no officer or clerk shall be appointed, and no person shall be employed to enter or be promoted in either of the said classes now existing, or that may be arranged hereunder pursuant to said rules, until he has passed an examination, or is shown to be specially exempted from such examination in conformity herewith.

But nothing herein contained shall be construed to take from those honorably discharged from the military or naval service any preference conferred by the seventeen hundred and fifty-fourth section of the Revised Statutes, nor to take from the President any authority not inconsistent with this act conferred by the seventeen hundred and fifty-third section of said statutes; nor shall any officer not in the executive branch of the Government, or any person merely employed as a laborer or workman, be required to be classified hereunder; nor, unless by direction of the Senate, shall any person who has been nominated for confirmation by the Senate be required to be classified or to pass an examination.

Sec. 8. That no person habitually using intoxicating beverages to excess shall be appointed to, or retained in, any office, appointment, or employment to which the provisions of this act are applicable.

Sec. 9. That whenever there are already two or more members of a family in the public service in the grades covered by this act, no other member of such family shall be eligible to appointment to any of said grades.

Sec. 10. That no recommendation of any person who shall apply for office or place under the provisions of this act which may be given by any Senator or member of the House of Representatives, except as to the character or residence of the applicant, shall be received or considered by any person concerned in making any examination or appointment under this act.

Sec. 11. That no Senator or Representative or Territorial Delegate of the Congress, or Senator, Representative, or Delegate elect, or any officer or employé of either of said Houses, and no executive, judicial, military, or naval officer of the United States, and no clerk or employé of any department, branch, or bureau of the executive, judicial, or military or naval service of the United States shall, directly or indirectly, solicit or receive, or be in any manner concerned in soliciting or receiving, any assessment, subscription, or contribution for any political purpose whatever, from any officer, clerk, or employé of the United States, or any department, branch, or bureau thereof, or from any person receiving any salary or compensation from moneys derived from the Treasury of the United States.

Sec. 12. That no person shall, in any room or building occupied in the discharge of official duties by any officer or employé of the United States mentioned in this act, or in any navy-yard, fort, or arsenal, solicit in any manner whatever, or receive any contribution of money or any other thing of value for any political purpose whatever.

Sec. 13. No officer or employé of the United States mentioned in this act shall discharge, or promote, or degrade, or in any manner change the official rank or compensation of any other officer or employé, or promise or threaten so to do, for giving or withholding or neglecting to make any contribution of money or other valuable thing for any political purpose.

Sec. 14. That no officer, clerk, or other person in the service of the United States shall, directly or indirectly, give or hand over to any other officer, clerk, or person in the service of the United States, or to any Senator or member of the House of Representatives, or Territorial Delegate, any money or other valuable thing on account of or to be applied to the promotion of any political object whatever.

Sec. 15. That any person who shall be guilty of violating any provision of the four foregoing sections shall be deemed guilty of a misdemeanor, and shall,

on conviction thereof, be punished by a fine not exceeding \$5,000, or by imprisonment for a term not exceeding three years, or by such fine and imprisonment both, in the discretion of the court.

Reduction of the Rates for Letter-Postage.—In the Post-Office Appropriation Bill, as reported from the House Committee on Appropriations, there was a provision for the reduction of postage on letters from 3 cents to 2 cents per half-ounce, recommended by the Committee on the Post-Offices and Post-Roads. The proposition was discussed at some length in both branches of Congress. Mr. Bingham, of Pennsylvania, in advocating the measure, Dec. 14, 1882, before the House, said :

"I desire, before the House passes judgment upon the question of reduction of postage incorporated in the bill now before us, to submit some facts as well as some figures (figures which have been verified by the Post-Office officials and found correct), warranting and justifying the proposition, reported by the Committee on the Post-Office and Post-Roads, for a reduction of the rate of letter-postage from 3 cents per half-ounce to 2 cents per half-ounce, or fraction thereof, as the law for the future, and that this measure should go into effect on the 1st of January, 1884, that date being fixed as the time the reduction could be made without the necessity of a deficiency in the present bill; for at the end of the next fiscal year, June 30, 1884, there will be under a 2-cent rate no deficiency called for by the Post-Office Department to be appropriated from the Treasury.

"Taking the estimates submitted by the department of the amount of business which will be done during the next fiscal year, it will be \$8,000,000. The way that is reached is by a sum total of the sales of postage-stamps and stamped envelopes during the past year and 10 per cent. added for the current year and 10 per cent. of increase for the next fiscal year. That 10 per cent. is an average estimate of the increase of the postal business of the country, and is added for this and the next year.

"It is believed, Mr. Chairman, so far as an examination of the discussion of this question has been common to the newspaper press and the great monthly leading publications of the country, that in view of the vast sums of money flowing into the Treasury of the Government at the present time, not only from the Post-Office Department but from the various other sources of revenue which come to the Government from the systems of taxation to which the people are subject, now is the time for the reduction of letter-postage from 3 cents to 2 cents, and that such legislation will find a hearty approval from every community and section of the country.

"Sir, in order that the House may understand that 2-cent postage is not a temporary expedient or an unduly considered proposition of to-day, the Committee on the Post-Office and Post-Roads in their bill reported to this

House one week ago, asking that this reduction might take effect on the 1st of January, 1884, referred to the history of postage, and developed in the investigation information of a character that can with directness, and to my mind convincing force, be called to the attention of this House, without reference at this time to the several reductions of postage on letter matter since the first act of Congress fixing rate of postage on domestic letters, Feb. 20, 1792, was passed. It seems but just that the recommendation under date of Nov. 30, 1850, of Postmaster-General N. K. Hall, and the approval of the same by President Fillmore, should receive attention.

"Ex-Postmaster-General Hall, in his report, 1850, makes the following recommendation :

"A considerable reduction of letter-postage and the adoption of a uniform inland rate are desired by a large portion of the people of the United States. . . . I recommend that the inland letter-postage be reduced to 3 cents the single letter when prepaid, and be fixed at the uniform rate of 5 cents when not prepaid; and also that the Postmaster-General be required to reduce this prepaid rate to 2 cents the single letter whenever it shall be ascertained that the revenues of the department, after the reductions now recommended, shall have exceeded its expenditures by more than 5 per cent. for two consecutive fiscal years.

"President Fillmore, under date of Dec. 2, 1850, calls the attention of Congress to the recommendations of his Post-master General, in this language :

"I am happy to find that the fiscal condition of the department is such as to justify the Postmaster-General in recommending the reduction of our inland letter-postage to 3 cents the single letter when prepaid and 5 cents when not prepaid. He also recommends that the prepaid shall be reduced to 2 cents whenever the revenues of the department, after the reductions, shall exceed its expenditures by more than 5 per cent. for two consecutive years.

"Congress acted upon the recommendation of President Fillmore and Postmaster-General Hall, and for the first time gave to the people a uniform inland rate and adopted the 3-cent postage for all distances not exceeding 3,000 miles.

"The conditions suggested in 1850 are now almost literally fulfilled, and the reduction to the 2-cent rate has found equally as able and sincere indorsers in the several recommendations of gentlemen who have carefully investigated the subject.

"In 1862 a committee, appointed by the merchants and business men of New York, presented a petition to Congress asking for postal reform and a reduction of rates in letter matter. The paper is so able and comprehensive that I ask the indulgence of the House while I read several paragraphs pertinent to the question at issue. The committee use this language :

"The committee to whom it was referred to prepare an address to the people of the United States upon the necessity of postal reform, and also as to the nature and extent of the changes that should be introduced into our postal system, beg leave to report :

"There is no feature that more peculiarly characterizes the Government under which we live, there is nothing perhaps upon which its peculiar character depends more than the rapid, constant, and general intercommunication between its citizens. Unlike the countries of Europe, no material obstacle of dialect, much less of language, interposes itself from one end of the republic to the other; no class privileges or prejudices separate one portion of the community from another; the methods of communication are various and extensive; and it may safely be affirmed that there is no country in the world where there is the same uniformity of habits, opinions, and modes of action as in the United States. Of the various methods of communication that of rapid, punctual, and safe correspondence by mail is the most important and the most highly valued by the citizen. Were our post-office the most efficient and the best conducted in the world, and were it at the same time the most expensive branch of the General Government, it is believed that no one would object to the cost, whatever it might be.

"Following the example of the monarchical governments of the Old World, the framers of our Constitution invested Government with a monopoly of mail operations. The people of the United States have never seen fit to revoke that power. It then unquestionably becomes the duty of Government to bring our postal establishment to the highest possible state of efficiency; but the almost unanimous voice of public opinion declares that our post-office is entirely inadequate to meet the wants of the people. . . .

"With very material reductions of postage that we have had within the last twelve years, we do not believe we have established that rate which will best accommodate the public and give the highest revenue. All experience, both in our own and other countries, demonstrates clearly that the number of letters written and sent by mail is in proportion to the facilities of transmission and in an inverse ratio to the cost of postage. The postal statistics of every nation show conclusively that, however great the reduction of postage, the revenue and profits have invariably increased. . . .

"It might not be unreasonable to maintain, with the economy of management attending a uniform rate of postage and the vast increase of correspondence that would attend a material reduction of charges, that the Post-Office would sustain itself under the uniform rate of 1 cent. One half of the postal revenue of Great Britain being clear profit, shows that this rate would be abundantly able to support the post-office in that country. Without, however, instituting a direct comparison between that country and this, we are fully convinced that a uniform rate of two cents a letter is the most equitable and convenient charge that can be made; a rate that will eventually produce the largest revenue, and a rate justified by every consideration of justice, economy, and sound national policy. . . .

"With most persons of ample means three cents would not be considered a high rate of postage, but with large numbers of the poorer and humbler classes that charge unquestionably abridges correspondence and retards business and social intercourse.

"Hon. A. D. Hazen, Third Assistant Postmaster-General, uses this language in a public document concerning a discussion of postal questions:

"The deficiency of revenue from the Treasury to meet the expenditures was only 7.5 per cent. at the close of the last year; and with a gain of more than 10 per cent. in receipts over expenditures during the past three years, it is not improbable that the postal service will be self-sustaining within the next three years. More than this; with the increasing intelligence of our people; with a continuation of our present business prosperity; with the rapidly-growing density of our population, more especially in the

sparsely-settled regions of the country; with wise and faithful administration of the Government, the way will be paved not only for a still greater efficiency of the service, but for a reduction of postage, even on the basis of an equality between the postal receipts and the postal expenditures. The present decade may witness a reduction of the domestic letter rate of postage from three to two cents upon these conditions. The Post-Office Department must continue to keep pace with the development and growth of the material interests of the country, if it would deserve to remain the 'cherished favorite' with the American people.

"Again, ex-Postmaster-General James uses this language in his official report:

"If these suggestions are deemed worthy of consideration and Congress carries them out, the reduction of letter-postage from three to two cents will be possible within three years. I believe the reduction could be accomplished without a proportional diminution of receipts, which followed the adoption of three-cent postage in 1851. The people have shown their appreciation of cheap postage. The introduction of the postal-card, instead of diminishing the receipts, has, on the whole, largely increased them. Two-cent postage would, I believe, after one or two years' trial, produce the same result. It is my deliberate judgment that two-cent postage is possible in the near future.

"This was under date of Nov. 15, 1881.

"The message of President Arthur, submitted to this House under date of Dec. 4, 1882, is strong, forcible, and clear in its distinct and unequivocal recommendation of the 2-cent rate.

"The proposition is a simple one, that any reduction, large or small, in the rate of postage that may be directed by legislation will benefit the masses of the people. I assert, Mr. Chairman, that the mere statement of the proposition carries its own conclusion. The census enumeration of 1880 gives the statistics showing the average degree of education of the people, and the statistics of the Post-Office Department show to what extent the people have exercised their educational opportunities and have availed themselves of the facilities of the Post-Office Department.

"As illustrating the extent to which the mails of the country are used, the following report, which has been incidentally referred to by the gentleman from Kansas in his debate with the gentleman from Massachusetts, for the year ending Dec. 30, 1880, will best indicate that which I am referring to, and will explain the general as well as special effects of postage relief which the people of each and every State will enjoy when the reduction recommended is accomplished. The table I refer to, and which I will append as a part of my remarks, and which is a part of the report as emanating from the Committee on the Post-Office and Post-Roads, is based upon the result of an actual count of mail matter originating at all the post-offices and railway post-offices of the United States during the first seven days of December, 1880. I use the data of December, 1880, because no count has been made for the year 1881. And right in that connection, before referring to the table, I want this committee to understand the exact relations that the American people hold with the people of

other nations and governments of the world in the use of the mails as a means of communication. The number of post-offices are in the following relative proportion, and I will insert the table in full in my remarks in order that the details may be examined.

"I quote from the report of the Superintendent of Foreign Mails for the year ending July 30, 1882:

"It appears by these statistics that the relative rank of the principal union countries, in respect to the following particulars, was as follows:

"1. In number of post-offices the United States ranks first, with 42,989 offices; then Great Britain, with 14,549; Germany, with 9,460; France, 5,942; Japan, 4,665; Russia, 4,458; British India, 4,409; Austria, 4,025; Italy, 3,323; Switzerland, 2,862; Spain, 2,642; Hungary, 2,301; Sweden, 1,785; the Netherlands, 1,316; Norway, 924; Mexico, 897; Belgium, 792; Portugal, 755; Denmark, 560.

"2. In respect to the relative proportion between the number of post-offices and that of population the principal countries of the union rank as follow: Switzerland has an average of 993 inhabitants to each post-office; the United States, 1,167 to each office; Norway, 2,078; Great Britain, 2,872; Sweden, 2,568; the Netherlands, 3,085; Luxembourg, 3,175; Denmark, 3,537; Germany, 4,778; Austria, 5,498; France, 6,211; Portugal, 6,285; Spain, 6,338; the Argentine Republic, 6,400; Belgium, 6,991; Hungary, 7,258; Japan, 7,701; Italy, 8,545.

"3. In number of letter-boxes for reception of correspondence the principal countries rank as follow: France, 57,960 letter-boxes; Germany, 57,782; Great Britain, 37,782; the United States, 18,460; Italy, 11,550; Spain, 9,408; Austria, 8,018; Russia, 7,957; Japan, 6,935; British India, 6,892; Belgium, 5,456; Switzerland, 5,270; Denmark, 3,389; Hungary, 3,263; the Netherlands, 3,047; Sweden, 2,700; Portugal, 1,303.

"4. In number of letters conveyed in the mails the principal countries rank as follow: Great Britain, 1,174,423,600 letters; the United States, 847,880,029; Germany, 522,689,800; France, 488,462,768; Austria, 174,999,000; Italy, 151,471,018; British India, 118,072,489; Russia, 92,451,476; Spain, 66,526,891; Hungary, 64,647,572; Belgium, 61,209,200; the Netherlands, 48,070,589; Switzerland, 45,739,594; Japan, 26,896,795; Sweden, 27,180,454; Denmark, 22,011,999; Portugal, 14,124,919.

"5. In number of postal-cards conveyed in the mails the principal countries rank as follow: The United States, 275,324,224 postal-cards; Germany, 135,135,100; Great Britain, 122,884,000; Austria, 38,026,000; France, 27,540,065; Japan, 19,884,451; Italy, 19,714,710; Belgium, 14,720,842; the Netherlands, 13,775,947; Hungary, 12,965,458; British India, 7,471,984; Switzerland, 6,649,297; Russia, 4,682,544; Sweden, 1,250,081; Roumania, 685,802; Portugal, 252,751; Norway, 209,014; Denmark, 178,128; Spain, 161,986; Luxembourg, 155,888.

"6. In respect to the number of letters and postal-cards per each inhabitant the principal countries rank as follow: Great Britain, 37·6 to each inhabitant; the United States, 22·8; Switzerland, 22·4; the Netherlands, 17·1; Belgium, 16·2; Germany, 15·6; France, 14·9; Denmark, 12·6; Luxembourg, 11·7; Austria, 11·1; Sweden, 6·9; Italy, 6·6; Norway, 6·7; Spain, 4·1; Portugal, 3·3; Greece, 1·7; Japan, 1·6; Roumania, 1·2; Russia, 1·1.

"7. In number of newspapers conveyed in domestic mails the principal countries rank as follow: The United States, 730,269,063 newspapers; Germany, 420,944,000; France, 285,691,654; Great Britain, 133,796,100; Russia, 83,238,945; Italy, 81,060,778; Austria, 75,282,900; Belgium, 64,680,000; Switzerland, 49,987,736; the Netherlands, 33,632,452; Hungary, 27,722,577; Denmark, 25,007,457; Sweden,

21,087,086; Japan, 17,596,758; British India, 11,251,021; Norway, 10,402,002; Argentine Republic, 7,500,000; Greece, 1,688,841.

"Several of the bills that have received the attention of the post-office committee indicate one ounce as the basis or minimum weight for the first rate of postage. It is not considered that the change from one half ounce to one ounce as the basis would afford relief to the great body of correspondents. While the large business houses and firms would enjoy the reduction, the average letter would not be carried for a less rate. Nor is it deemed advisable at this time to embrace the two propositions of an increase in weight and a reduction in rate in the legislation recommended. The half-ounce weight is the basis in the Universal Postal Union, now embracing all the civilized countries and colonies of the world except Bolivia and the British Australasian colonies. The half-ounce is also the basis for the domestic rate of postage in the principal countries of the world.

"The official reports of the Post-Office Department for the year ended June 30, 1882, show a marked surplus over expenditures. A small surplus, \$132,202.65, however, occurred in the year 1861, and again in the year 1865, when it amounted to \$861,430, doubtless occasioned by the suspension of mail service in the Southern States. During the year ended June 30, 1851, the receipts amounted to \$6,410,604.83, and the expenditures to \$6,278,401.68. In the year 1852 the receipts were \$5,184,526.84, and the expenditures \$7,108,459.04, leaving a deficiency of \$1,923,932.20, or 27 per cent., to be supplied from the general Treasury. This deficiency steadily grew, principally by reason of largely increased expenditures, until 1860, nearly one half of the expenditures for which year were paid out of the Treasury.

"During the four years of the war, from 1861 to 1865, the receipts fell only 4·7 per cent. short of the expenditures. In 1865 alone, as before indicated, there was a small surplus of receipts. The restoration of service in the Southern States again increased the burden on the Treasury, so that in 1868 28·3 per cent. of the expenditures were supplied from that source. From this point the tendency was generally toward lower deficiencies, but still in 1875 the Treasury contributed 20·2 per cent. of the expenditures. In 1879 the deficiency was 10·1 per cent., and for 1881 the receipts fell 7 per cent. short of the expenditures. This deficiency was not only wiped out during the last year, but a surplus of 8·6 per cent. of the receipts will remain after extinguishing all the liabilities for the year.

"I believe the introduction of the postal-card for 1 cent contributed largely to the increase of the revenues of the Post-Office Department. But I go further and will say that I believe that when we reduce the postage on letters to 2 cents, many who have recognized the economy of saving 2 cents as between the letter

and the postal-card, and now use the postal-card as a means of economy and thereby save 2 cents of postage, will under the 2-cent rate for letters give up the postal-card, in order to secure secrecy in their correspondence.

"From the establishment of the Government the principle has been recognized and the effort of every administration has been directed to the making of the postal service self-supporting, while at the same time every facility possible has been extended to the people. In the British service, as well as in our own, the rate charged for the transmission of mail matter was based on the estimated absolute service rendered, the distances the mail was carried being the basis of the rate charged. The act of Congress of 1851 qualifiedly changed the existing statutes and made the inland service uniform in the rate charged for distances less than 3,000 miles. The limit, however, of 3,000 miles was wiped out by the act of 1868, which gave us the uniform rate of 8 cents the half-ounce or fraction thereof, and which is the statute enforced to-day. The people have never complained when the deficiency in the postal service required appropriations from the Treasury. Nor, on the other hand, has any special effort been made to secure large surplus results, greater conveniences, larger facilities, and cheaper rates of postage for all classes of mail matter seem to have been recommended and to have formed a part of every Postmaster-General's report for many years.

"General Hazen, in a paper submitted to me, asserts that the department is surely on a paying basis, and as the receipts are increasing at a much greater rate than the expenditures, the general Treasury will at an early day, unless there should be a change in the present conditions, be a large gainer from the profits of the postal service. If, however, the theory be correct that the earnings should not be permitted to exceed the outlays of the service, the question is squarely presented as to how the balance shall be maintained. If the present profits could be used advantageously to extend facilities and to afford conveniences to the public not now enjoyed, there can be scarcely a doubt of the popular willingness to have them applied in this direction.

"Popular as has been the idea of a self-sustaining service, public opinion has ever sanctioned the granting of needful sums from the Treasury, rather than the usefulness of the service should be impaired by a lack of means from the postal revenues. But the expenditures for the coming year have been estimated upon the full measure of the public requirements, as well as the same can now be anticipated, and yet they fall considerably short of the estimated revenues. The result promises to be a large increase on the present profits. The time would seem to be auspicious, therefore, for a reduction in the rates of postage.

"In reference to the effect of reduction in postage the experience of the past has been

found instructive. The changes in rates of domestic matter were comparatively unimportant up to the 1st of July, 1845. In order that the several changes in the domestic rates may be fully understood by the House I have inserted in my remarks a part of the report of the Committee on the Post-Office and Post-Roads, which cites the various statutes since 1792, when the first statute was enacted covering the first postage on letter matter. Then gentlemen can see for themselves the gradual changes and observe the many reductions:

1. February 20, 1792, was the first act fixing rates of postage on domestic letters, and established the following rates, to take effect June 1, 1792:

Act February 20, 1792, section 9, by land: For every single letter not exceeding 80 miles, 6 cents.

For every single letter over 80 miles, and not exceeding 60 miles, 8 cents.

For every single letter over 60 miles, and not exceeding 100 miles, 10 cents.

For every single letter over 100 miles, and not exceeding 150 miles, 12½ cents.

For every single letter over 150 miles and not exceeding 200 miles, 15 cents.

For every single letter over 200 miles, and not exceeding 250 miles, 17 cents.

For every single letter over 250 miles, and not exceeding 350 miles, 20 cents.

For every single letter over 350 miles, and not exceeding 450 miles, 22 cents.

For every single letter over 450 miles, 25 cents.

For every double letter, double the said rates.

For every triple letter, triple the said rates.

For every packet weighing one ounce avoirdupois to pay at the rate of four single letters for each ounce, and in that proportion for any greater weight.

2. Act March 2, 1799, section 7, establishes a General Post-Office at the seat of Government of the United States.

For every letter composed of single sheet of paper conveyed not exceeding 40 miles, 8 cents; over 40 miles, and not exceeding 90 miles, 10 cents; over 90 miles, and not exceeding 150 miles, 12½ cents; over 150 miles and not exceeding 300 miles, 17 cents; over 300 miles, and not exceeding 500 miles, 20 cents; over 500 miles, 25 cents.

Double letter or two pieces of paper, double rates.

Triple letter or three pieces of paper, triple rates; and for every packet composed of four or more pieces of paper, or other thing, and weighing 1 ounce avoirdupois, quadruple rate, and in same proportion for greater weights.

3. Act April 30, 1810, section 11: Rates of postage on letters and packets:

Single sheet of paper, less than 40 miles 8
 Single sheet of paper, 40 to 90 miles..... 10
 Single sheet of paper, 90 to 150 miles..... 12½
 Single sheet of paper, 150 to 300 miles..... 17
 Single sheet of paper, 300 to 500 miles..... 20
 Single sheet of paper, over 500 miles..... 25

Double letters or two pieces of paper, double rates; triple letters or three pieces of paper, triple rates; every packet composed of four or more pieces of paper or other thing, and weighing one ounce avoirdupois, quadruple rate; and in same proportion for greater weight.

4. Act April 9, 1816, section 1: Rates of postage after May 1, 1816:

Every letter composed of a single sheet of paper, less than 80 miles..... 6
 Over 80 miles and not exceeding 90 miles..... 10
 Over 90 miles and not exceeding 150 miles..... 12½
 Over 150 miles and not exceeding 400 miles..... 15½
 Over 400 miles..... 25

Double letters or two pieces of paper, double rates; triple letters or three pieces of paper, triple rates; every packet composed of four or more pieces of paper or other thing, and weighing one ounce avoirdupois, quadruple rate; and in same proportion for greater weight.

5. Act April 9, 1816, section 1: Rates of postage after May 1, 1816:

Every letter composed of a single sheet of paper, less than 80 miles..... 6
 Over 80 miles and not exceeding 90 miles..... 10
 Over 90 miles and not exceeding 150 miles..... 12½
 Over 150 miles and not exceeding 400 miles..... 15½
 Over 400 miles..... 25

Every double letter or two pieces of paper, double rates.

Every triple letter or three pieces of paper, triple rates.

Every packet containing four or more pieces of paper or one or more other articles, and weighing one ounce avoirdupois, quadruple these rates, and in that proportion for all greater rates.

5. Act of March 3, 1825, section 13: Same as act of April 9, 1816.

6. Act March 3, 1845, section 1: After July 1, 1845.

Postage on letters: For every single letter in manuscript, or marks and signs, by mail, under three hundred miles, 5 cents; over three hundred miles, 10 cents; double letter, double rates; treble letter, treble rates; quadruple letter, quadruple rates; and every letter or parcel not exceeding one half ounce in weight shall be deemed a single letter, and every additional weight of one half ounce or less shall be charged with an additional single postage.

7. Act March 3, 1851, section 1: Rates of postage on letters: From and after June 30, 1851, in lieu of rates of postage now fixed by law, there shall be charged the following rates:

Every single letter, in writing, marks, or signs, by mail, not exceeding three thousand miles, prepaid postage, 3 cents; not prepaid, 5 cents; for any greater distance, double these rates.

8. Act March 3, 1855, section 1: In lieu of the rates of postage now fixed by law, there shall be charged the following rates:

For every single letter, in manuscript or paper of any kind, in writing, marks, or signs, conveyed in the mail between places in the United States, not exceeding 3,000 miles, 3 cents; and for any greater distance, 10 cents; for a double letter, double rates; treble letter, treble rates; quadruple letter, quadruple rates; every letter or parcel not exceeding one half ounce in weight shall be deemed a single letter, and every additional weight of one half ounce or less shall be charged an additional rate.

9. Act March 3, 1863, section 22, fixes the rate of postage on domestic letters not exceeding one half ounce in weight at 3 cents, and 3 cents additional for each additional half ounce or fraction thereof, to be prepaid by postage-stamps affixed.

Taking distance into account, it will be observed that the reduction in the charges was very great if the comparison is made on the rates prior to July 1, 1845, and the rates fixed to take effect July 1, 1845. The rates established by the act of March 3, 1851, also mark a great reduction.

Although a temporary loss of revenue followed these two reductions, it was speedily followed in both cases by a large increase.

"I again avail myself of the valuable figures of Mr. Hazen, Third Assistant Postmaster-General:

For several years prior to 1845 the revenues were almost stationary in amount; indeed, for the four years ended June 30, 1845, the total amount was \$304,433.64 less than for the four years immediately preceding that period. For the year ended June 30, 1845, the revenue was \$4,289,841.80, and for the next year, under the reduced rates, it was \$3,437,199.35, showing a falling off of \$802,642.45. For the year 1847 it increased to \$3,880,309.28, and for the year 1848 to \$4,556,211.10, or \$265,869.80 more than for the year 1845, the entire recovery of the loss of revenue from the reduction in the rates having thus occurred within three years. The increase continued at a rapid pace, so that for the year ended June 30, 1851, the revenue was \$6,410,604.33, being \$2,120,762.53, or 49.4 per cent., more than for the last year (1845) under the old rates, and \$2,928,404.98, or 83.8 per cent., more than for the first year (1846) of the new rates.

The immediate loss of revenue by the act of March 3, 1851, was still greater, but this, too, was speedily recovered. The falling off in the first year of the change was \$1,226,077.49, the entire receipts for the

year ended June 30, 1852, having been \$5,184,526.84. For the year ended June 30, 1854, the revenue amounted to \$6,255,536.22, or only \$155,018.11 less than for the year 1851, the loss by the reduction of the rates having been nearly recovered in three years. For the year 1855 the revenue was \$231,581.80 more than for 1851. The increase steadily continued, and for the year ended June 30, 1860, the revenue was swelled to \$8,518,067.40, being \$2,107,463.07, or 32.8 per cent., more than for the year 1851, and \$3,333,540.56, or 64.2 per cent., more than for 1852.

Again, during the eight years from 1837 to 1845 there were no material changes in the rates of postage, and yet the revenue for 1845 was \$655,826.41, or 13.2 per cent., less than for 1837, while the revenue for the year ended June 30, 1853, was \$950,382.90, or 22.1 per cent., over that of 1845, notwithstanding that both of the great reductions in the rates of postage had occurred during the intermediate eight years.

For the year 1882 the receipts were more than eight times as much as for 1852, and the increase alone for 1882 over 1851 was only \$93,514.66 short of the entire receipts for the year ended June 30, 1852, the first year of the 3-cent rate. Some idea of the immediate loss by a reduction from 3 cents to 2 cents in the rate of letter-postage may be obtained from the issues of the ordinary 3-cent adhesive stamps and stamped envelopes.

It is true that many letters calling for more than one rate of postage bear the higher denominations of stamps, but it is also true that many 3-cent stamps are used for parcels of merchandise and other matter not belonging to the first class. The amount of 3-cent stamps used in this way will probably exceed that of the larger stamps used on letters, so that a diminution of 33 1/3 per cent. in the value of the 3-cent stamps would represent the maximum loss on an equal volume of business. The number of the ordinary 3-cent stamps and stamped envelopes issued during the fiscal year ended June 30, 1882, was 849,159,950. An increase of 10 per cent. on these would give 934,075,945 as the issue for the current year. This latter number increased by 10 per cent. would give 1,027,483,539 for the next fiscal year. One cent taken from the value of each of these would amount to \$10,274,835.39.

"Now the act of 1863 fixed the rate of postage on domestic letters not exceeding one half ounce in weight at 3 cents, and 3 cents additional for each additional half ounce or fraction thereof, to be prepaid by postage-stamps. The recommendation of the Committee on the Post-Office and Post-Roads, which I am glad to see has been almost literally adopted in this bill, makes a simple change in the law of 1863, that of the reduction of rate from 3 to 2 cents per half ounce, and the same shall go into effect the 1st of January, 1884.

"It is claimed that the stimulus of the lower rate would be felt at once, and that there would be a large increase of letters mailed, which is the history of all legislation that pertains to a reduction on domestic matter. It is probable that a cheaper letter rate would tend also in a measure to dispense with a large number of postal-cards for written communications. In view also of the fact that sealed communications invite closer attention by the recipients than do open ones, it is not improbable that to some extent circulars would be inclosed under a seal at the 2-cent rate. Taking these special reasons into account, it is believed by the Post-Office Department that the loss of revenue for the first year may be safely put at \$8,000,000, leaving the revenue

for the year at \$42,670,456.27 instead of \$50,670,456.27, as already estimated upon the basis of existing rates. This estimate of \$42,670,456.27 for the year 1884 on a 2-cent rate is \$3,393,594.89, or 7.8 per cent., less than the estimated revenue for 1883, and it is \$794,046.12 more than the actual revenue for 1882.

"Unless the experience of past reductions in this and other countries should be at fault in this instance, the reduction now proposed in the letter rate will be speedily followed by a large augmentation of business, and it will at no distant day prove to have been an economic measure of the highest importance to the postal service as well as to the country."

The appropriation bill, containing the provision for the reduction of letter-postage, to go into effect Jan. 15, 1884, was passed by the House Dec. 20, 1882, and was taken up for discussion in the Senate Jan. 17, 1883. Among the opponents of the proposed reduction was Senator Platt, of Connecticut, who said: "I believe that this proposition to reduce postage from 3 cents to 2 cents upon sealed letters is premature, and I desire that Congress shall have the opportunity for a second sober thought before the law goes into operation. I will endeavor in the briefest manner possible to give my reasons why I think this proposed reduction is premature.

"In the first place, if postage is to be reduced there are other directions in which the reduction is as imperatively demanded as in this direction. The additional postage of 1 cent upon drop-letters in cities having free delivery is a real burden upon the business correspondence of those cities. I think it should receive first attention, as I will endeavor to show as I proceed. It doubles the postage upon letters as a penalty for having free delivery which the Government ought not only to give without additional pay but ought very largely to extend.

"Then I think the postage on unsealed letters, business correspondence in unsealed letters, might be reduced to 2 cents quite as properly as this reduction; but I think that the whole scheme of the reduction of postage at this time is premature. I know that there seems to be the opinion prevailing in Congress and in certain newspapers that there is a very general demand for this reduction in letter-postage. I confess I have not heard it out of Congress and out of the newspapers. I have not heard it among the people, and I do not believe that the people esteem it to be any hardship upon them to pay 3 cents postage upon a letter sent to any part of this country. Where one person has spoken to me on that subject ten persons have spoken to me on other matters connected with the post-office system, and I think the general desire among the people is that there shall be no reduction of postage till the revenues of the Post-Office Department have been expended to develop and perfect the post-office system and give the people greater

conveniences than they now have, and make that system more efficient.

"I make no criticism upon the Post-Office Department. The growth and development of the post-office system has been great. Post-masters-General have done all that they could under the disposition in Congress not to make large expenditures for the Post-Office Department so long as there was a deficiency. Many improvements which they would have desired to introduce and have recommended to Congress time and time again they have not been able to carry out because Congress would not make the necessary appropriations, and the reason given in Congress for not making the necessary appropriations always has been that the Post-Office Department entailed a large deficiency. Now, for the first time in twenty years, I think, the Post-Office Department is self-sustaining, and we have arrived just at that point where we ought to improve this system, where we ought to make it more efficient, where we ought to study the convenience of the people and see that the United States is not behind the rest of the world in the conveniences which it affords to the people through this postal system.

"Now, allow me to refer to some minor matters. The matter of office accommodations at the third and fourth class offices is a matter in which there may be very great improvement. The convenience to the people can be wonderfully enhanced. I will not weary the Senate by going into detail. It is within the personal observation of every Senator who is familiar with the post-offices in the smaller places, that the conveniences might be increased 100 and 200 per cent. with very little additional expense. I think it ought to be done. I think the expenses necessary to make this increase should be borne now when the department is self-sustaining. If it is not done now it never will be.

"Another thing that I wish to speak of is this: We should have more frequent mails. Take New England and the Middle States, and Senators will be surprised to learn, I think, that certainly one fifth of the mail routes in the New England and Middle States are less than daily. Is there any reason why in these States, where a railroad reaches usually within ten or fifteen miles of every town, every town should not have a daily mail? I know towns in my own State, within eight or ten miles of a railroad, that have but a semi-weekly mail. I have endeavored to have it increased to a daily mail, but I have been met continually with the statement that Congress would not appropriate sufficient money for that purpose, and the reason Congress would not do it was because there was a deficiency in the Post-Office Department. Take the towns and cities that are situated upon railroads, the mails carried upon railroads should be increased in frequency. A town of three or five thousand inhabitants, situated upon a railroad, should never be dependent upon one daily mail. And

upon this point, there is no reason why we should not have special mail facilities by fast trains. That subject, which was discussed here yesterday, points what I am saying upon this matter. The speed of mails should be increased. We should carry mails as fast as passengers are carried in this country, and we should not stand here higgling and debating whether we will spend \$185,000 in a year to increase the speed of mails, to make it possible to send a letter to Chicago or St. Louis and get an answer a day quicker than we should otherwise. What the people want in these matters is to be well served, served as well as it is possible that they shall be served, no matter what the expense is. Take the matter of box-rents. The whole subject of box-rents needs readjusting. They need to be cheapened. We want better offices, better box accommodations, better service at offices.

"But, Mr. President, there is another thing that we want still more. We want the free delivery of the mails extended, and largely extended. There are in the United States, according to the census, 246 cities of over 10,000 inhabitants. In those cities very nearly one quarter of the population of the United States resides. There is no reason why the Government should not deliver in every one of those cities of the United States, without the additional charge of one cent upon each drop-letter, the letters received in those cities, at the doors of the individuals to whom they are addressed. Oh, but, Senators say, that will cost money. Indeed, it will cost money, but I desire that the Post-Office revenues shall not be reduced until a convenience like that shall be extended just as far as it is practicable to extend it.

"I find by the Postmaster-General's report that only 112 cities now have free delivery. The law only makes it obligatory upon the Postmaster-General to give a free delivery of letters in cities of 30,000 inhabitants, and makes it discretionary with him to allow it in cities where the population is 20,000, or the gross revenues are \$20,000. I think that that law should be repealed. I find by the Postmaster-General's report, desirous as he has been and desirous as Congress has been that there should be no deficiency in the Post-Office Department any longer, that this free-delivery system has been extended to but three cities in the United States during the past fiscal year.

"Take my own State. From recollection, I say that there are something over fifteen towns and cities having a population compact, I think, within a mile or two of the post-office to the farthest delivery, ranging in population from five to twenty-five thousand inhabitants. I think it much better to spend the surplus revenues of the Post-Office Department in seeing that within such towns and cities as those letters are delivered at the doors of those to whom they are addressed without extra charge for the service, rather than that postage should be

reduced. I believe that the people think so too. I do not believe that the people are clamoring at the doors of Congress to reduce postage from three cents to two cents until these improvements have been adopted. In Great Britain more than 90 per cent. of the letters are delivered to the individuals at their residences or places of business, and I think, without extra charge. It is a principle of the English system that the delivery of letters shall be universal.

"More than 90 per cent. of the letters going through the British Post-Office are delivered at the doors of the persons to whom they are addressed. In the early history of the postal system in England it was the law that it should be so done. As far back as 1794 there are cases in the reports where actions were brought against postmasters for not delivering letters wherever they were addressed, and it was decided to be the law of England that they should be so delivered. It was the law in this country during the Confederate Congress. Letter-carriers were always appointed in this country at the discretion of the postmaster to deliver letters without additional charge, until this free-delivery system, as it is called, came into vogue. It should be one of the fundamental principles of a well-regulated postal system that every letter should be delivered to the individual addressed, where it is possible and practicable that it should be done. It would be an improvement which the people would hail with joy, ten times the joy that they will hail the reduction of postage, but it never will be done until the Post-Office is not only self-sustaining but earns a surplus revenue. I can not, with the pressure of time that there is upon the Senate, stop to dwell upon these things; I can merely outline them; I can merely call the attention of Senators to what I believe to be the real desire of the people upon this question, and I will, when I close, propose an amendment to change the existing law with reference to the free delivery of letters.

"But there is another subject to which I desire to allude, a subject in which there is already a great interest, a growing interest, an interest that will grow and make a voice that will have to be heard and heeded in the halls of legislation, and that is the question of the transmission of messages by electricity, by the telegraph. The telegraph to-day is the rich man's mail. The time is coming, and it is hastening rapidly, when the people of this country will demand that it shall be no longer the rich man's mail, but that it shall be brought within the reach and ability of every individual in this land. I can not understand how it is that a Government like ours, that professes to be in advance of the world, that boasts of its progressive spirit and tendencies, that boasts of its invention, that boasts of the utilization of the arts and sciences in its borders, should fall back on the slow railroad and steamboat for the transmission of its messages, and allow

quick transmission to be in the hands of a single corporation substantially in this country.

"I said that the telegraph to-day was the rich man's mail. The transmission of letters and messages is a Government function, it pertains to the Government, and it ought never to have been suffered to go out of the hands of Government. We ought just as much to utilize the telegraph as to utilize the sending of letters by the railway. Formerly letters were carried on foot or on horseback. I remember when the saddle-bags thrown across the horse contained the letters which were sent through the country. Then we adopted the steamboat and then the railroad, and then we insist that we shall have fast trains. Why? that we may get a letter to California in a week and get an answer in a week, and the Government proposes to do it for three cents. The Government can send a letter of twenty words to California and get an answer in a single day at an expense, I verily believe, of not more than 25 cents. Ought not the Government to do it? Can the Government excuse itself for not serving the people with this new means of communicating messages?"

"I said that the transmission of messages by electricity was mainly in the hands of a single corporation. I am not continually talking about monopolies, but I do say that this business of carrying letters, of transmitting messages, is a monopoly which belongs to the Government of the United States and not to corporations, and if those gentlemen who are troubled with the power and the increasing power of monopolies, and justly troubled, desire to look about for the greatest monopoly of the world in proportion to its capital, they will find it in this same telegraph company. Its receipts the last year were \$17,000,000 and its acknowledged profits were \$7,000,000, more than 40 per cent. of its receipts. I say its acknowledged profits; what its real profits were no one knows.

"If the Government, as it ought to have done under the statute of 1866 authorizing it to do so, had taken control of the telegraph system of this country it would have saved last year \$7,000,000 to the people of this country; and that is a better saving than the saving which they propose to effect upon postage, because with that saving would have come the added convenience, as the telegraph would have been brought within the reach of the humblest individual. If an individual in common life now receives a telegraphic dispatch he fears that it means death or disaster. If the Government in 1866 had taken the telegraph, it would be a common means of communication between the common people of this country to-day.

"The enormous profits which are lost to the individuals of the country and are put in the pockets of the stockholders of this corporation are nothing to what they are expected to be. The president of the corporation in his

last annual report estimates that the receipts of the company in the year 1887 will be between \$31,000,000 and \$32,000,000, and the profits \$16,000,000.

"I insist upon it that there should be no diminution of the revenues of the Post-Office Department until its surplus funds have been used at least to make a fund for the purchase, at an appraised value, of the telegraph lines of the United States. Looking forward five years to 1887, taking the report and estimate of the president of that corporation in the year 1887, it would save \$16,000,000 to the people of the United States and afford them vastly increased facilities for corresponding with each other. I have no time to elaborate this proposition to-day. I believe that when the people come to think of these matters they will vastly prefer that the convenience of the present system shall be extended; that new improvements shall be adopted; that the frequency of mails shall be increased; that the speed of mails shall be increased; that free delivery shall be extended almost indefinitely; and that Congress shall take steps before the coming storm to see to it that the control of the telegraph system of this country passes into the hands of the Government."

Mr. Edmunds, of Vermont, offered an amendment proposing to strike out the whole clause of the bill relating to the reduction of letter-postage, on the ground that legislation of a general nature in an appropriation bill was in violation of rule 29, which is as follows:

No amendment which proposes general legislation shall be received to any general appropriation bill; nor shall any amendment not germane or relevant to the subject-matter contained in the bill be received; nor shall any amendment to any item or clause of such bill be received which does not directly relate thereto; and all questions of relevancy of amendments under this rule, when raised, shall be submitted to the Senate and be decided without debate; and any amendment to a general appropriation bill may be laid on the table without prejudice to the bill.

The amendment was rejected by the following vote, which shows the attitude of the Senate on the question of postal reduction:

YEAS—Anthony, Blair, Cameron of Pennsylvania, Cameron of Wisconsin, Davis of Illinois, Edmunds, Hawley, Hoar, Jones of Florida, Lapham, Miller of New York, Morrill, Platt, Rollins, Sherman—15.

NAYS—Barrow, Beck, Brown, Call, Camden, Cockrell, Coke, Conger, Dawes, Frye, Gariand, George, Gorman, Groome, Hale, Hampton, Harris, Harrison, Hill, Ingalls, Johnston, Jonas, Kellogg, Lamar, McDill, McMillan, Mahone, Maxey, Morgan, Pendleton, Plumb, Pugh, Sewell, Slater, Vance, Van Wyck, Vest, Voornees, Walker, Williams—40.

ABSENT—Aldrich, Allison, Bayard, Butler, Chittcott, Davis of West Virginia, Fair, Farley, Ferry, Grover, Jackson, Jones of Nevada, Logan, McPherson, Miller of California, Mitchell, Ransom, Saulsbury, Saunders, Sawyer, Windom—21.

January 20th, the bill passed the Senate with several important amendments. One of them changed the date of the proposed reduction in the rate of letter-postage; another added an appropriation for fast mails; another provided

an appropriation for steamboat mail service; and another struck out the following provision of the original bill:

Provided, That for the better accomplishment of the objects of the acts authorizing the construction of the railroads hereinafter referred to, and the better to secure to the Government the use and benefit of the same, the acts authorizing the building and construction of those railroads which have received, in addition to land grants, Government aid by the loan or guarantee of bonds by the United States, and all other acts, parts of acts, and provisions having relation thereto, are hereby so altered, amended, and modified that hereafter the compensation paid or allowed for the carrying and transportation of the United States mails by such railroad companies, or their assigns or successors, shall be fixed by the Postmaster-General, at a rate not exceeding that fixed by him or allowed by law to other railway companies of the same class to which the United States have furnished aid by grant of land, right of way, or otherwise.

The House non-concurred in these amendments, and three conference committees in succession discussed the points of difference, and failed to come to a complete agreement. The last committee fixed Oct. 1, 1888, as the date for the reduction of the rate of letter-postage; and finally, on March 2d, the House receded from its non-concurrence in the striking out of the provision in regard to the land-grant railroads and the insertion of an appropriation for fast mails. The next day the measure as amended was approved by the President.

Internal Revenue and Tariff Legislation.—The Tariff Commission appointed under the act of Congress, approved May 15, 1882, made a report to the House of Representatives Dec. 4, 1882, and the report submitted became the basis of the legislation for tariff revision that took up so great a part of the session. The report, after a general view of the tariff problem, took up each class of articles and gave an account of the condition of trade in them and the nature of the action to be taken with respect to duties levied on them, and the data on which such action was based. It closed with a schedule of proposed duties and a statement of proposed amendments to the revised statutes. The reduction which the committee recommended averaged not less than 20 per cent. In some cases it was slight; in others no reduction was attempted at all; and in many instances there was a scaling down of from 40 to 50 per cent. On the report of the commission as a basis, the House Committee of Ways and Means reported a tariff bill Jan. 16, 1883, which was taken up and elaborated with great care; but in the mean while, a bill to reduce internal revenue taxation which had passed the House and had been referred to the Finance Committee of the Senate, was reported back to that body Jan. 4, 1883, with amendments virtually revising the whole tariff system and the machinery for carrying it out, which amendments were based also upon the report of the tariff commission. The Senate entered upon the discussion of this measure with zeal, and

debated it item by item at great length. It was passed Feb. 20, 1883, by the following vote:

YEAS—Aldrich, Allison, Anthony, Barrow, Bayard, Blair, Brown, Camden, Cameron of Wisconsin, Conger, Davis of Illinois, Davis of West Virginia, Dawes, Edmunds, Frye, Gorman, Hale, Harrison, Hawley, Hoar, Ingalls, Jackson, Jones of Florida, Jones of Nevada, Kellogg, Logan, McMillan, McPherson, Miller of California, Miller of New York, Morrill, Platt, Plumb, Rollins, Sawyer, Sewell, Sherman, Slater, Tabor, Van Wyck, Windom—42.

NAYS—Beck, Call, Cockrell, Coke, Farley, Garland, George, Hampton, Harris, Maxey, Mitchell, Pendleton, Pugh, Ransom, Vance, Vest, Voorhees, Walker, Williams—19.

ABSENT—Butler, Cameron of Pennsylvania, Fair, Ferry, Groome, Grover, Johnston, Jonas, Lamar, Lapham, McDill, Mahone, Morgan, Saulsbury, Saunders—15.

It was determined by the majority in the House to abandon the tariff bill of that body and act upon the internal-revenue bill as amended by the Senate, and in order to facilitate the consideration of the measure in the House, the Committee on Rules reported Feb. 24, 1883, the following amendment to the rules of that body:

During the remainder of this session it shall be in order at any time to move to suspend the rules, which motion shall be decided by a majority vote, to take from the Speaker's table House bill No. 5538, with the Senate amendment thereto, entitled "A bill to reduce internal-revenue taxation," and to declare a disagreement with the Senate amendment to the same, and to ask for a committee of conference thereon, to be composed of five members on the part of the House. If such motion shall fail, the bill shall remain upon the Speaker's table unaffected by the decision of the House upon said motion.

After a brief but bitter opposition, this special rule was adopted Feb. 27th. As a question of privilege, Mr. Hammond, of Georgia, then submitted the following resolution:

Resolved, That the substitute of the Senate (H. R. 5538) entitled "An act to reduce internal-revenue taxation, and for other purposes," under the form of an amendment to the bill of the House (H. R. 5538) entitled "An act to reduce internal-revenue taxation," containing a general revision and repeal of laws imposing both import duties and internal taxes, is in conflict with the true intent and purposes of that clause of the Constitution which requires "all bills for raising revenue shall originate in the House of Representatives"; and that therefore said bill so amended do lie upon the table.

And be it further resolved, That the Clerk of the House be and is hereby directed to notify the Senate of the passage of the foregoing resolution.

On motion of Mr. Haskell, of Kansas, the following preamble and resolution were substituted and adopted:

Whereas, House bill 5538, entitled "An act to reduce internal revenue taxation, and for other purposes," under the form of an amendment in the Senate, to title 23 of the Revised Statutes, which provides for duties on imports, has been so modified and changed by the introduction of new provisions, containing among other things a general revision of the statutes referred to so as both to increase and reduce duties on imports, and in many instances to repeal and in others to amend the laws imposing import duties; and

Whereas in the opinion of this House it is believed that such changes and alterations are in conflict with the true intent and purpose of the Constitution, which requires that all bills for raising revenue shall originate in the House of Representatives: therefore,

Resolved, That if this bill shall be referred to a committee of conference, it shall be the duty of the conferees on the part of the House on said committee to consider fully the constitutional objections to said bill as amended by the Senate herein referred to, and to bring the same, together with the opinion of the House in regard thereto, before said committee of conference, and if necessary, in their opinion, after having conferred with the Senate conferees, said conferees on said committee may make report to the House in regard to the objections to said bill herein referred to.

The House non-concurred in the Senate amendments to the original bill, and a conference committee was appointed Feb. 27th. Two of the conferees on the part of the Senate, Messrs. Bayard and Beck, asked, March 1st, to be excused from service on learning the nature of the conditions imposed by the House upon its representatives in the conference committee, holding that such instructions were a breach of senatorial privilege. March 2d the report of the conference committee was submitted in the Senate. It was sharply criticised by leading Democrats, but was finally concurred in by the following vote:

YEAS—Aldrich, Allison, Anthony, Blair, Cameron of Wisconsin, Conger, Davis of Illinois, Dawes, Edmunds, Frye, Harrison, Hawley, Hill, Hoar, Ingalls, Jones of Nevada, Kellogg, Lapham, Logan, McDill, McMillan, McPherson, Mahone, Miller of New York, Morrill, Platt, Plumb, Rollins, Sawyer, Sewell, Sherman, Windom—32.

NAYS—Barrow, Bayard, Brown, Butler, Call, Cameron of Pennsylvania, Cockrell, Coke, Fair, Garland, George, Gorman, Grooms, Harris, Jackson, Jonas, Jones of Florida, Lamar, Maxey, Morgan, Pendleton, Pugh, Ransom, Saulsbury, Slater, Vance, Van Wyck, Vest, Voorhees, Walker, Williams—31.

ABSENT—Beck, Camden, Davis of West Virginia, Farley, Ferry, Grover, Hale, Hampton, Johnston, Miller of California, Mitchell, Saunders, Tabor—13.

March 8d the report of the conference committee was taken up in the House, and concurred in by the following vote:

YEAS—Aldrich, Anderson, Barr, Belford, Belz-hoover, Bingham, Bisbee, Bliss, Bowman, Brewer, Briggs, Browne, Buck, Julius C. Burrows, Joseph H. Burrows, Butterworth, Calkins, Camp, Candler, Cannon, Carpenter, Caswell, Chace, Crapo, Crowley, Cullen, George R. Davis, Deering, De Motte, Dezendorf, Dingley, Doxey, Dunnell, Dwight, Ermentrout, Charles B. Farwell, Sewell S. Farwell, Fisher, Fulker-son, George, Godshalk, Grout, Guenther, Hall, John Hammond, Hardenbergh, Hardy, Harmer, Benjamin W. Harris, Henry S. Harris, Haskell, Hazelton, Heilman, Henderson, Hepburn, Hill, Hiseock, Hitt, Horr, Houk, Hubba, Humphrey, Jacobs, Jéwin, Phineas Jones, Jorgensen, Joyce, Kasson, Kelley, Ketcham, Klotz, Lacey, Ladd, Lewis, Lindsey, Lord, Lynch, Mackey, Marsh, Mason, McCoid, McCook, James H. McLean, Miles, Moore, Morey, Morse, Mutchler, Neal, Norcross, O'Neill, Pacheco, Page, Parker, Payson, Peele, Peirce, Pettibone, Pound, Randall, Ranney, Ray, Reed, Rich, D. P. Richardson, Ritchie, Robeson, George D. Robinson, Ross, Ryan, Scoville, Scranton, Sessinghaus, Shallenber-ger, Shelley, Sherwin, Shultz, Skinner, Smalls, A. Herr Smith, Dietrich C. Smith, J. Hyatt Smith, Spaulding, Speer, Spooner, Steale, Stone, Strait,

Thomas, Amos Townsend, Tyler, Updegraff, Valen-tine, Van Aernam, Van Horn, Van Voorhis, Wade-worth, Wait, Walker, Ward, Washburn, Watson, Webber, West, White, Charles G. Williams, Willits, Wilson, George D. Wise, Morgan R. Wise, Walter A. Wood, Young—152.

NAYS—Aiken, Armfield, Atherton, Atkins, Bar-bour, Bayne, Beach, Belmont, Berry, Blackburn, Blanchard, Bland, Blount, Bragg, Brumm, Buchanan, Buckner, Cabell, Caldwell, Campbell, Carlisle, Cassidy, Chapman, Clark, Clements, Cobb, Colerick, Converse, John C. Cook, Philip Cook, Covington, Samuel S. Cox, William E. Cox, Culberson, David-son, Lowndes H. Davis, Dawes, Deuster, Dibrell, Dowd, Dugro, Dunn, Ellis, Errett, Evins, Flower, Ford, Forney, Garrison, Geddes, Gibson, Gunter, N. J. Hammond, Haseltine, Hatch, Herbert, Abram S. Hewitt, Hoblitzell, Hoge, Holman, House, Hub-bell, Hutchins, George W. Jones, James K. Jones, Kenna, King, Knott, Latham, Leedom, Le Fevre, Manning, Martin, Matson, McKenzie, McKinley, Robert M. McLane, McMillin, Miller, Mills, Money, Morrison, Moulton, Muldrow, Murch, Reese, John B. Rice, Theron M. Rice, J. S. Richardson, Rob-ertson, James S. Robinson, William E. Robinson, Rosecrans, Scales, Simonton, Otho E. Singleton, Sparks, Springer, Stockslager, Talbott, Ezra B. Tay-lor, Joseph D. Taylor, P. B. Thompson, R. W. Townshend, Tucker, Henry G. Turner, Oscar Turn-er, Upson, Urner, Vance, Warner, Wellborn, Wheeler, Whitthorne, Thomas Williams, Willis—116.

NOT VOTING—Black, Clardy, Cornell, Cravens, Curtain, Darrall, Herndon, G. W. Hewitt, Hooker, McClure, Moogrove, Nolan, Oates, Paul, Phelps, Phister, Prescott, Reagan, William W. Rice, Russell, James W. Singleton, William G. Thompson, Benja-min Wood—23.

The measure was approved by the President the same day and became a law. It is as fol-lows:

An act to reduce internal revenue taxation and for other purposes:

Be it enacted by the Senate and House of Representa-tives of the United States in Congress assembled:

That the taxes herein specified, imposed by the laws now in force, be and the same are hereby repealed, as hereinafter provided, namely: On capital and de-posits of banks, bankers, and national banking asso-ciations, except such taxes as are now due and payable; and on and after the first day of July, eighteen hun-dred and eighty-three, the stamp tax on bank checks, drafts, orders, and vouchers, and the tax on matches, perfumery, medicinal preparations, and other articles imposed by Schedule A following section thirty-four hundred and thirty-seven of the Revised Statutes: Provided, That no drawback shall be allowed upon articles embraced in said schedule that shall be ex-ported on and after the first day of July, eighteen hundred and eighty-three: Provided, further, That on and after May fifteenth, eighteen hundred and eighty-three, matches may be removed by manufactur-ers thereof from the place of manufacture to ware-houses within the United States without attaching thereto the stamps required by law, under such regu-lations as may be prescribed by the Commissioner of Internal Revenue.

SEC. 2. That on and after the first day of May, eighteen hundred and eighty-three, dealers in leaf-tobacco shall annually pay twelve dollars; dealers in manufactured tobacco shall pay two dollars and forty cents; all manufacturers of tobacco shall pay six dol-lars; manufacturers of cigars shall pay six dollars; peddlers of tobacco, snuff and cigars shall pay special taxes as follows: Peddlers of the first class, as now defined by law, shall pay thirty dollars; peddlers of the second class shall pay fifteen dollars; peddlers of the third class shall pay seven dollars and twenty cents; and peddlers of the fourth class shall pay

three dollars and sixty cents. Retail dealers in leaf-tobacco shall pay two hundred and fifty dollars, and thirty cents for each dollar on the amount of their monthly sales in excess of the rate of five hundred dollars per annum: Provided, That farmers and producers of tobacco may sell at the place of production tobacco of their own growth and raising at retail directly to consumers, to an amount not exceeding one hundred dollars annually.

Sec. 3. That hereafter the special tax of a dealer in manufactured tobacco shall not be required from any farmer, planter, or lumberman who furnishes such tobacco only as rations or supplies to his laborers or employes in the same manner as other supplies are furnished by him to them: Provided, That the aggregate of the supplies of tobacco so by him furnished shall not exceed in quantity one hundred pounds in any one special tax year; that is, from the first day of May in any year until the thirtieth day of April in the next year: And provided further, That such farmer, planter, or lumberman shall not be, at the time he is furnishing such supplies, engaged in the general business of selling dry goods, groceries, or other similar supplies in the manner of a merchant or storekeeper to others than his own employes or laborers.

Sec. 4. That on and after May first, eighteen hundred and eighty-three, the internal taxes on snuff, smoking and manufactured tobacco, shall be eight cents per pound; and on cigars which shall be manufactured and sold or removed for consumption or sale on and after the first day of May, eighteen hundred and eighty-three, there shall be assessed and collected the following taxes, to be paid by the manufacturer thereof: On cigars of all descriptions, made of tobacco or any substitute therof, three dollars per thousand; on cigarettes weighing not more than three pounds per thousand, fifty cents per thousand; on cigarettes weighing more than three pounds per thousand, three dollars per thousand: Provided, That on all original and unbroken factory packages of smoking and manufactured tobacco and snuff, cigars, cheroots, and cigarettes held by manufacturers or dealers at the time such reduction shall go into effect, upon which the tax has been paid, there shall be allowed a drawback or rebate of the full amount of the reduction, but the same shall not apply in any case where the claim has not been presented within sixty days following the date of the reduction; and such rebate to manufacturers may be paid in stamps at the reduced rate; and no claim shall be allowed or drawback paid for a less amount than ten dollars. It shall be the duty of the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, to adopt such rules and regulations and to prescribe and furnish such blanks and forms as may be necessary to carry this section into effect.

Sec. 5. That from and after the passage of this act every manufacturer of tobacco or snuff shall, in addition to all other requirements of law, print on each package, or securely affix by pasting on each package containing tobacco or snuff manufactured by or for him, a label on which shall be printed the number of the manufactory, the district and State in which it is situated, and these words:

NOTICE.

The manufacturer of this tobacco has complied with all requirements of law. Every person is cautioned, under penalties of law, not to use this package for tobacco again.

Sec. 6. That on and after the first day of July, eighteen hundred and eighty-three, the following sections shall constitute and be a substitute for title thirty-three of the Revised Statutes of the United States.

TITLE XXXIII.

DUTIES UPON IMPORTS.

Sec. 2491. All persons are prohibited from importing into the United States from any foreign country, any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other

representation, figure, or image on or of paper or other material, or any cast, instrument, or other article of an immoral nature, or any drug or medicine, or any article whatever, for the prevention of conception, or for causing unlawful abortion. No invoice or package whatever, or any part of one, in which any such articles are contained shall be admitted to entry; and all invoices and packages whereof any such articles shall compose a part are liable to be proceeded against, seized, and forfeited by due course of law. All such prohibited articles in the course of importation shall be detained by the officer of customs, and proceedings taken against the same as prescribed in the following section: Provided, That the drugs hereinbefore mentioned, when imported in bulk and not put up for any of the purposes hereinbefore specified, are excepted from the operation of this section.

Sec. 2492. Whoever, being an officer, agent, or employe of the Government of the United States, shall knowingly aid or abet any person engaged in any violation of any of the provisions of law prohibiting importing, advertising, dealing in, exhibiting, or sending or receiving by mail obscene or indecent publications or representations, or means for preventing conception or procuring abortion, or other articles of indecent or immoral use or tendency, shall be deemed guilty of a misdemeanor, and shall for every offense be punishable by a fine of not more than five thousand dollars or by imprisonment at hard labor for not more than ten years, or both.

Sec. 2493. Any judge of any district or circuit court of the United States, within the proper district, before whom complaint in writing of any violation of the preceding sections is made, to the satisfaction of such judge, and founded on knowledge or belief, and, if upon belief, setting forth the grounds of such belief, and supported by oath or affirmation of the complainant, may issue, conformably to the Constitution, a warrant directed to the marshal, or any deputy-marshal, in the proper district, directing him to search for, seize, and take possession of any such article or thing hereinbefore mentioned, and to make due and immediate return thereof, to the end that the same may be condemned and destroyed by proceedings which shall be conducted in the same manner as other proceedings in the case of municipal seizure, and with the same right of appeal or writ of error.

Sec. 2494. The importation of neat cattle and the hides of neat cattle from any foreign country into the United States is prohibited: Provided, That the operation of this section shall be suspended as to any foreign country or countries, or any parts of such country or countries, whenever the Secretary of the Treasury shall officially determine, and give public notice thereof, that such importation will not tend to the introduction or spread of contagious or infectious diseases among the cattle of the United States; and the Secretary of the Treasury is hereby authorized and empowered, and it shall be his duty, to make all necessary orders and regulations to carry this law into effect, or to suspend the same as therein provided, and to send copies thereof to the proper officers in the United States, and to such officers or agents of the United States in foreign countries as he shall judge necessary.

Sec. 2495. Any person convicted of a willful violation of any of the provisions of the preceding section shall be fined not exceeding five hundred dollars, or imprisoned not exceeding one year, or both, in the discretion of the court.

Sec. 2496. No watches, watch-cases, watch-movements, or parts of watch-movements, or any other articles of foreign manufacture, which shall copy or simulate the name or trade-mark of any domestic manufacturer, shall be admitted to entry at the custom-houses of the United States, unless such domestic manufacturer is the importer of the same. And in order to aid the officers of the customs in enforcing this prohibition, any domestic manufacturer who has adopted trade-marks may require his name and residence and a description of his trade-marks to be re-

corded in books which shall be kept for that purpose in the Department of the Treasury, under such regulations as the Secretary of the Treasury shall prescribe, and may furnish to the department fac-similes of such trade-marks; and thereupon the Secretary of the Treasury shall cause one or more copies of the same to be transmitted to each collector or other proper officer of the customs.

Sec. 2497. No goods, wares, or merchandise, unless in cases provided for by treaty, shall be imported into the United States from any foreign port or place, except in vessels of the United States, or in such foreign vessels as truly and wholly belong to the citizens or subjects of that country of which the goods are the growth, production, or manufacture; or from which such goods, wares, or merchandise can only be, or most usually are, first shipped for transportation. All goods, wares, or merchandise imported contrary to this section, and the vessel wherein the same shall be imported, together with her cargo, tackle, apparel, and furniture, shall be forfeited to the United States; and such goods, wares, or merchandise, ship, or vessel, and cargo shall be liable to be seized, prosecuted, and condemned, in like manner, and under the same regulations, restrictions, and provisions, as have been heretofore established for the recovery, collection, distribution, and remission of forfeitures to the United States by the several revenue laws.

Sec. 2498. The preceding section shall not apply to vessels, or goods, wares, or merchandise, imported in vessels of a foreign nation which does not maintain a similar regulation against vessels of the United States.

Sec. 2499. There shall be levied, collected, and paid on each and every non-enumerated article which bears a similitude, either in material, quality, texture, or the use to which it may be applied, to any article enumerated in this title as chargeable with duty, the same rate of duty which is levied and charged on the enumerated article which it most resembles in any of the particulars before mentioned; and if any non-enumerated article equally resembles two or more enumerated articles on which different rates are chargeable, there shall be levied, collected, and paid on such non-enumerated article the same rate of duty as is chargeable on the article which it resembles paying the highest duty; and on all articles manufactured from two or more materials the duty shall be assessed at the highest rates at which the component material of chief value may be chargeable. If two or more rates of duty should be applicable to any imported article, it shall be classified for duty under the highest of such rates: Provided, That non-enumerated articles similar in material and quality and texture, and the use to which they may be applied, to articles on the free list, and in the manufacture of which no dutiable materials are used, shall be free.

Sec. 2500. Upon the reimportation of articles once exported of the growth, product, or manufacture of the United States, upon which no internal tax has been assessed or paid, or upon which such tax has been paid and refunded by allowance or drawback, there shall be levied, collected, and paid a duty equal to the tax imposed by the internal-revenue laws upon such articles.

Sec. 2501. A discriminating duty of ten per centum ad valorem, in addition to the duties imposed by law, shall be levied, collected, and paid on all goods, wares, and merchandise which shall be imported on vessels not of the United States; but this discriminating duty shall not apply to goods, wares, and merchandise which shall be imported in vessels not of the United States, entitled, by treaty or any act of Congress, to be entered in the ports of the United States on payment of the same duties as shall then be paid on goods, wares, and merchandise imported in vessels of the United States.

Sec. 2502. There shall be levied, collected, and paid upon all articles imported from foreign countries, and mentioned in the schedules herein contained, the rates

of duty which are, by the schedules, respectively prescribed, namely:

SCHEDULE A.—CHEMICAL PRODUCTS.

- Glue, twenty per centum ad valorem.
- Beeswax, twenty per centum ad valorem.
- Gelatine and all similar preparations, thirty per centum ad valorem.
- Glycerine, crude, brown or yellow, of the specific gravity of one and twenty-five hundredths or less at a temperature of sixty degrees Fahrenheit, not purified by refining or distilling, two cents per pound.
- Glycerine, refined, five cents per pound.
- Fish-glue or isinglass, twenty-five per centum ad valorem.
- Phosphorus, ten cents per pound.
- Soap, hard and soft, all which are not otherwise specially enumerated or provided for in this act, and castile soap, twenty per centum ad valorem.
- Fancy, perfumed, and all descriptions of toilet soap, fifteen cents per pound.
- Sponges, twenty per centum ad valorem.
- Sumac, ground, three tenths of one cent per pound, and sumac extract, twenty per centum ad valorem.
- Acid, acetic, acetous, or pyroligneous acid, not exceeding the specific gravity of one and forty-seven one thousandths, two cents per pound; exceeding the specific gravity of one and forty-seven one thousandths, ten cents per pound.
- Acid, citric, ten cents per pound.
- Acid, tartaric, ten cents per pound.
- Camphor, refined, five cents per pound.
- Castor beans, or seeds, fifty cents per bushel of fifty pounds.
- Castor-oil, eighty cents per gallon.
- Cream of tartar, six cents per pound.
- Dextrine, burnt starch, gum substitute, or British gum, one cent per pound.
- Extract of hemlock, and other bark used for tanning, not otherwise enumerated or provided for in this act, twenty per centum ad valorem.
- Glucose, or grape-sugar, twenty per centum ad valorem.
- Indigo, extracts of, and carmined, ten per centum ad valorem.
- Iodine, resublimed, forty cents per pound.
- Licorice, paste or roll, seven and one half cents per pound; licorice-juice, three cents per pound.
- Oil of bay-leaves, essential, or bay rum essence or oil, two dollars and fifty cents per pound.
- Oil, croton, fifty cents per pound.
- Oil, flaxseed or linseed, and cotton-seed oil, twenty-five cents per gallon; seven and one half pounds weight to be estimated as a gallon.
- Hemp-seed oil and rape-seed oil, ten cents per gallon.
- Soda and potassa, tartarate, or rochelle salt, three cents per pound.
- Strychnia, or strychnine, and all salts thereof, fifty cents per ounce.
- Tartars, partly refined, including lees crystals, four cents per pound.
- Alumina, alum, patent alum, alum substitute, sulphate of alumina, and aluminous cake, and alum in crystals or ground, sixty cents per hundred pounds.
- Ammonia, anhydrous, liquefied by pressure, twenty per centum ad valorem.
- Ammonia aqua, or water of ammonia, twenty per centum ad valorem.
- Ammonia, muriate of, or sal-ammoniac, ten per centum ad valorem.
- Ammonia, carbonate of, twenty per centum ad valorem.
- Ammonia, sulphate of, twenty per centum ad valorem.
- All imitations of natural mineral waters and all artificial mineral waters, thirty per centum ad valorem.
- Asbestos, manufactured, twenty-five per centum ad valorem.
- Baryta, sulphate of, or barytes, unmanufactured, ten per centum ad valorem.

Baryta, sulphate of, or barytes, manufactured, one fourth of one cent per pound.

Refined borax, five cents per pound.

Pure boracic acid, five cents per pound; commercial boracic acid, four cents per pound; borate of lime, three cents per pound; crude borax, three cents per pound.

Cement, Roman, Portland, and all others, twenty per centum ad valorem.

Whiting and Paris white, dry, one half cent per pound; ground in oil, or putty, one cent per pound.

Prepared chalk, precipitated chalk, French chalk, red chalk, and all other chalk preparations which are not specially enumerated or provided for in this act, twenty per centum ad valorem.

Chromic acid, fifteen per centum ad valorem.

Chromate of potash, three cents per pound.

Bichromate of potash, three cents per pound.

Cobalt, oxide of, twenty per centum ad valorem.

Copper, sulphate of, or blue vitriol, three cents per pound.

Iron, sulphate of, or copperas, three tenths of one cent per pound.

Acetate of lead, brown, four cents per pound.

Acetate of lead, white, six cents per pound.

White lead, when dry or in pulp, three cents per pound.

When ground or mixed in oil, three cents per pound.

Litharge, three cents per pound.

Orange mineral, and red lead, three cents per pound.

Nitrate of lead, three cents per pound.

Magnesia, medicinal, carbonate of, five cents per pound.

Magnesia, calcined, ten cents per pound.

Magnesia, sulphate of, or Epsom salts, one half of one cent per pound.

Potash:

Crude, carbonate of, or fused, and caustic potash, twenty per centum ad valorem.

Chlorate of, three cents per pound.

Hydriodate, iodide and iodate of, fifty cents per pound.

Prussiate of, red, ten cents per pound.

Prussiate of, yellow, five cents per pound.

Nitrate of, or saltpeter, crude, one cent per pound.

Nitrate of, or refined saltpeter, one and one half cent per pound.

Sulphate of, twenty per centum ad valorem.

Soda:

Soda-ash, one quarter of one cent per pound.

Soda sal, or soda crystals, one quarter of one cent per pound.

Bicarbonate of, or super-carbonate of, and saleratus, calcined or pearl ash, one and one half cents per pound.

Hydrate, or caustic, one cent per pound.

Sulphate, known as salt cake, crude or refined, or niter cake, crude or refined, and Glauber's salt, twenty per centum ad valorem.

Soda, silicate of, or other alkaline silicate, one half of one cent per pound.

Sulphur:

Refined, in rolls, ten dollars per ton.

Sublimed, or flowers of, twenty dollars per ton.

Wood-tar, ten per centum ad valorem.

Coal-tar, crude, ten per centum ad valorem.

Coal-tar, products of, such as naphtha, benzine, benzole, dead oil, and pitch, twenty per centum ad valorem.

All coal-tar colors or dyes, by whatever name known and not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

All preparations of coal-tar, not colors or dye, not specially enumerated or provided for in this act, twenty per centum ad valorem.

Logwood and other dyewoods, extracts and decoctions of, ten per centum ad valorem.

Ultramarine, five cents per pound.

Turpentine, spirits of, twenty cents per gallon.

Colors and paints, including lakes, whether dry or mixed, or ground with water or oil, and not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

The pigment known as bone-black, and Ivory-drop black, and bone-char, twenty-five per centum ad valorem.

Ochre and ochrey earths, umber and umber earths, and sienna and sienna earths, when dry, one half of one cent per pound; when ground in oil, one and one half cent per pound.

Zinc, oxide of, when dry, one and one fourth cent per pound.

Zinc, oxide of, when ground in oil, one and three fourths cent per pound.

All preparations known as essential oils, expressed oils, distilled oils, rendered oils, alkalies, alkaloids, and all combinations of any of the foregoing, and all chemical compounds and salts, by whatever name known, and not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

Preparations: all medicinal preparations known as cerates, conserves, decoctions, emulsions, extracts, solid or fluid; infusions, juices, liniments, lozenges, mixtures, mucilages, ointments, oleo-resins, pills, plasters, powders, resins, suppositories, sirups, vinegars, and waters, of any of which alcohol is not a component part, and which are not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

All barks, beans, berries, balsams, buds, bulbs, and bulbous roots, and excrescences, such as nutgalls, fruits, flowers, dried fibers, grains, gums, and gum-resins, herba, leaves, lichens, mosses, nuts, roots and stems, spices, vegetables, seeds (aromatic, not garden seeds), and seeds of morbid growth, weeds, woods used expressly for dyeing, and dried insects, any of the foregoing of which are not edible, but which have been advanced in value or condition by refining or grinding, or by other process of manufacture, and not specially enumerated or provided for in this act, ten per centum ad valorem.

All non-dutiable crude minerals, but which have been advanced in value or condition by refining or grinding, or by other process of manufacture, not specially enumerated or provided for in this act, ten per centum ad valorem.

All ground or powdered spices not specially enumerated or provided for in this act, five cents per pound.

All earths or clays, unwrought or unmanufactured, not specially enumerated or provided for in this act, one dollar and fifty cents per ton.

All earths or clays, wrought or manufactured, not specially enumerated or provided for in this act, three dollars per ton; china clay, or kaolin, three dollars per ton.

Proprietary preparations, to wit: All cosmetics, pills, powders, troches, or lozenges, sirups, cordials, bitters, anodynes, tonics, plasters, liniments, salves, ointments, pastes, drops, waters, essences, spirits, oils or preparations or compositions recommended to the public as proprietary articles, or prepared according to some private formula, as remedies or specifics for any disease or diseases, or affections whatever, affecting the human or animal body, including all toilet preparations whatever, used as applications to the hair, mouth, teeth, or skin, not specially enumerated or provided for in this act, fifty per centum ad valorem.

Alcoholic preparations:

Alcoholic perfumery, including cologne-water, two dollars per gallon and fifty per centum ad valorem.

Distilled spirits, containing fifty per centum of anhydrous alcohol, one dollar per gallon.

Alcohol, containing ninety-four per centum anhydrous alcohol, two dollars per gallon.

Alcoholic compounds, not otherwise specially enumerated or provided for, two dollars per gallon for the alcohol contained and twenty-five per centum ad valorem.

Chloroform, fifty cents per pound.
 Colloidion, and all compounds of pyroxyline, by whatever name known, fifty cents per pound; rolled or in sheets, but not made up into articles, sixty cents per pound, and when in finished or partly finished articles, sixty cents per pound and twenty-five per centum ad valorem.
 Ether, sulphuric, fifty cents per pound.
 Hoffman's anodyne, thirty cents per pound.
 Iodoform, two dollars per pound.
 Acid, tannic and tannin, one dollar per pound.
 Ether, nitrous, spirits of, thirty cents per pound.
 Santonine, three dollars per pound.
 Amylic alcohol, or fusel-oil, ten per centum ad valorem.
 Oil of Cognac, or cœnanthic ether, four dollars per ounce.
 Fruit ethers, oils, or essences, two dollars and fifty cents per pound.
 Oil or essence of rum, fifty cents per ounce.
 Ethers of all kinds, not specially enumerated or provided for in this act, one dollar per pound.
 Coloring for brandy, fifty per centum ad valorem.
 Preparations: All medicinal preparations known as essences, ethers, extracts, mixtures, spirits, tinctures, and medicated wines, of which alcohol is a component part, not specially enumerated or provided for in this act, fifty cents per pound.
 Varnishes of all kinds, forty per centum ad valorem; and on spirit varnishes, one dollar and thirty-two cents additional per gallon.
 Opium, crude, containing nine per cent. and over of morphia, one dollar per pound. The importation of opium containing less than nine per cent. morphia is hereby prohibited.
 Opium, prepared for smoking, and all other preparations of opium not specially enumerated or provided for in this act, ten dollars per pound; but opium prepared for smoking, and other preparations of opium deposited in bonded warehouses shall not be removed therefrom for exportation without payment of duties, and such duties shall not be refunded.
 Opium, aqueous extract of, for medicinal uses, and tincture of, as laudanum, and all other liquid preparations of opium, not specially enumerated or provided for in this act, forty per centum ad valorem.
 Morphia or morphine, and all salts thereof, one dollar per ounce.

SCHEDULE B.—EARTHENWARE AND GLASSWARE.

Brown earthenware, common stoneware, gas-retorts, and stoneware not ornamented, twenty-five per centum ad valorem.
 China, porcelain, parian, and bisque, earthen, stone, and crockery ware, including plaques, ornaments, charms, vases, and statuettes, painted, printed, or gilded, or otherwise decorated or ornamented in any manner, sixty per centum ad valorem.
 China, porcelain, parian, and bisque ware, plain white, and not ornamented or decorated in any manner, fifty-five per centum ad valorem.
 All other earthen, stone, and crockery ware, white, glazed, or edged, composed of earthy or mineral substances, not specially enumerated or provided for in this act, fifty-five per centum ad valorem.
 Stoneware, above the capacity of ten gallons, twenty per centum ad valorem.
 Encaustic tiles, thirty-five per centum ad valorem.
 Brick, fire-brick, and roofing and paving tile, not specially enumerated or provided for in this act, twenty per centum ad valorem.
 Slates, slate-pencils, slate chimney-pieces, mantels, slabs for tables, and all other manufactures of slate, thirty per centum ad valorem.
 Roofing-slates, twenty-five per centum ad valorem.
 Green and colored glass bottles, vials, demijohns, and carboys (covered or uncovered), pickle or preserve jars, and other plain, molded, or pressed green and colored bottle glass, not cut, engraved, or painted, and not specially enumerated or provided for in

this act, one cent per pound; if filled, and not otherwise in this act provided for, said articles shall pay thirty per centum ad valorem in addition to the duty on the contents.

Flint and lime glass bottles and vials, and other plain, molded, or pressed flint or lime glassware, not specially enumerated or provided for in this act, forty per centum ad valorem; if filled, and not otherwise in this act provided for, said articles shall pay, exclusive of contents, forty per centum ad valorem in addition to the duty on the contents.

Articles of glass, cut, engraved, painted, colored, printed, stained, silvered, or gilded, not including plate-glass, or looking-glass plates, forty-five per centum ad valorem.

All glass bottles and decanters, and other like vessels of glass, shall, if filled, pay the same rates of duty, in addition to any duty chargeable on the contents, as if not filled, except as in this act otherwise specially provided for.

Cylinder and crown glass, polished, not exceeding ten by fifteen inches square, two and one half cents per square foot; above that, and not exceeding sixteen by twenty-four inches square, four cents per square foot; above that, and not exceeding twenty-four by thirty inches square, six cents per square foot; above that, and not exceeding twenty-four by sixty inches square, twenty cents per square foot; all above that, forty cents per square foot.

Unpolished cylinder, crown, and common window-glass, not exceeding ten by fifteen inches square, one and three eighths cents per pound; above that, and not exceeding sixteen by twenty-four inches square, one and seven eighths cents per pound; above that, and not exceeding twenty-four by thirty inches square, two and three eighths cents per pound; all above that, two and seven eighths cents per pound: *Provided*, That unpolished cylinder, crown, and common window-glass, imported in boxes containing fifty square feet, as nearly as sizes will permit, now known and commercially designated as fifty feet of glass, single thick and weighing not to exceed fifty-five pounds of glass per box, shall be entered and computed as fifty pounds of glass only; and that said kinds of glass imported in boxes containing, as nearly as sizes will permit, fifty feet of glass, now known and commercially designated as fifty feet of glass, double thick and not exceeding ninety pounds in weight, shall be entered and computed as eighty pounds of glass only; but in all other cases the duty shall be computed according to the actual weight of glass.

Fluted, rolled, or rough plate-glass, not including crown, cylinder, or common window-glass, not exceeding ten by fifteen inches square, seventy-five cents per one hundred square feet; above that, and not exceeding sixteen by twenty-four inches square, one cent per square foot; above that, and not exceeding twenty-four by thirty inches square, one cent and a half per square foot; all above that, two cents per square foot. And all fluted, rolled, or rough plate-glass, weighing over one hundred pounds per one hundred square feet, shall pay an additional duty on the excess at the same rates herein imposed.

Cast polished plate-glass, unsilvered, not exceeding ten by fifteen inches square, three cents per square foot; above that, and not exceeding sixteen by twenty-four inches square, five cents per square foot; above that, and not exceeding twenty-four by thirty inches square, eight cents per square foot; above that, and not exceeding twenty-four by sixty inches square, twenty-five cents per square foot; all above that, fifty cents per square foot.

Cast polished plate-glass, silvered, or looking-glass plates, not exceeding ten by fifteen inches square, four cents per square foot; above that, and not exceeding sixteen by twenty-four inches square, six cents per square foot; above that, and not exceeding twenty-four by thirty inches square, ten cents per square foot; above that, and not exceeding twenty-four by

sixty inches square, thirty-five cents per square foot; all above that, sixty cents per square foot.

But no looking-glass plates or plate-glass, silvered, when framed, shall pay a less rate of duty than that imposed upon similar glass of like description not framed, but shall be liable to pay, in addition thereto, thirty per centum ad valorem upon such frames.

Porcelain and Bohemian glass, chemical glassware, painted glassware, stained glass, and all other manufactures of glass or of which glass shall be the component material of chief value, not specially enumerated or provided for in this act, forty-five per centum ad valorem.

SCHEDULE C.—METALS.

Iron-ores, including manganese iron-ore, also the dross or residuum from burnt pyrites, seventy-five cents per ton. Sulphur-ore, as pyrites, or sulphuret of iron in its natural state, containing not more than three and one half per centum of copper, seventy-five cents per ton: Provided, That ore containing more than two per centum of copper shall pay, in addition thereto, two and one half cents per pound for the copper contained therein.

Iron in pigs, iron kentledge, spiegeleisen, wrought and cast scrap-iron, and scrap-steel, three tenths of one cent per pound, but nothing shall be deemed scrap-iron or scrap-steel except waste or refuse iron or steel that has been in actual use and is fit only to be remanufactured.

Iron railway-bars, weighing more than twenty-five pounds to the yard, seven tenths of one cent per pound.

Steel railway-bars and railway-bars made in part of steel, weighing more than twenty-five pounds to the yard, seventeen dollars per ton.

Bar-iron, rolled or hammered, comprising flats not less than one inch wide, nor less than three eighths of one inch thick, eight tenths of one cent per pound; comprising round iron not less than three fourths of one inch in diameter, and square iron not less than three fourths of one inch square, one cent per pound; comprising flats less than one inch wide, or less than three eighths of one inch thick; round iron less than three fourths of one inch and not less than seven sixteenths of one inch in diameter, and square iron less than three fourths of one inch square, one and one tenth of one cent per pound: Provided, That all iron in slabs, blooms, loops, or other forms less finished than iron in bars, and more advanced than pig-iron, except castings, shall be rated as iron in bars, and pay a duty accordingly; and none of the above iron shall pay a less rate of duty than thirty-five per centum ad valorem: Provided further, That all iron bars, blooms, billets, or sizes or shapes of any kind, in the manufacture of which charcoal is used as fuel, shall be subject to a duty of twenty-two dollars per ton.

Iron or steel tee rails, weighing not over twenty-five pounds to the yard, nine tenths of one cent per pound; iron or steel flat rails, punched, eight tenths of one cent per pound.

Round iron, in coils or rods, less than seven sixteenths of one inch in diameter, and bars or shapes of rolled iron not specially enumerated or provided for in this act, one and two tenths of one cent per pound.

Boiler or other plate iron, sheared or unsheared, skelp-iron, sheared or rolled in grooves, one and one fourth cents per pound; sheet-iron, common or black, thinner than one-inch and one half and not thinner than number twenty wire gauge, one and one tenth of one cent per pound; thinner than number twenty wire gauge and not thinner than number twenty-five wire gauge, one and two tenths of one cent per pound; thinner than number twenty-five wire gauge and not thinner than number twenty-nine wire gauge, one and five tenths of one cent per pound; thinner than number twenty-nine wire gauge, and all iron commercially known as common or black taggers iron, whether put up in boxes or bundles or not, thirty per centum ad valorem: And provided, That on all such iron and steel sheets or plates aforesaid, excepting on

what are known commercially as tin-plates,terne-plates, and taggers tin, and hereafter provided for, when galvanized or coated with zinc or spelter, or other metals, or any alloy of those metals, three fourths of one cent per pound additional.

Polished, planished, or glanced sheet-iron, or sheet-steel, by whatever name designated, two and one half cents per pound: Provided, That plate or sheet or taggers iron, by whatever name designated, other than the polished, planished, or glanced herein provided for, which has been pickled or cleaned by acid, or by any other material or process, and which is cold-rolled, shall pay one quarter cent per pound more duty than the corresponding gauges of common or black sheet or taggers iron.

Iron or steel sheets, or plates, or taggers iron, coated with tin or lead, or with a mixture of which these metals is a component part, by the dipping or any other process, and commercially known as tin-plates,terne-plates, and taggers tin, one cent per pound; corrugated or crimped sheet iron or steel, one and four tenths of one cent per pound.

Hoop, or band, or scroll, or other iron, eight inches or less in width and not thinner than number ten wire gauge, one cent per pound; thinner than number ten wire gauge and not thinner than number twenty wire gauge, one and two tenths of one cent per pound; thinner than number twenty wire gauge, one and four tenths of one cent per pound: Provided, That all articles not specially enumerated or provided for in this act, whether wholly or partly manufactured, made from sheet, plate, hoop, band, or scroll iron herein provided for, or of which such sheet, plate, hoop, band, or scroll iron shall be the material of chief value, shall pay one fourth of one cent per pound more duty than that imposed on the iron from which they are made, or which shall be such material of chief value.

Iron and steel cotton-ties, or hoops for baling purposes, not thinner than number twenty wire gauge, thirty-five per centum ad valorem.

Cast-iron pipe of every description, one cent per pound.

Cast-iron vessels, plates, stove-plates, andirons, sad-irons, tailors' irons, hatters' irons, and castings of iron not specially enumerated or provided for in this act, one and one quarter of one cent per pound.

Cut nails and spikes, of iron or steel, one and one quarter of one cent per pound.

Cut tacks, brads, or sprigs, not exceeding sixteen ounces to the thousand, two and one half cents per thousand; exceeding sixteen ounces to the thousand, three cents per pound.

Iron or steel railway fish-plates, or splice-bars, one and one fourth of one cent per pound.

Malleable iron castings, not specially enumerated or provided for in this act, two cents per pound.

Wrought-iron or steel spikes, nuts, and washers, and horse, mule, or ox shoes, two cents per pound.

Anvils, anchors or parts thereof, mill-irons and mill-iranks of wrought-iron, and wrought-iron for ships, and forgings of iron and steel, for vessels, steam-engines, and locomotives, or parts thereof, weighing each twenty-five pounds or more, two cents per pound.

Iron or steel rivets, bolts, with or without threads or nuts, or bolt-blanks, and finished hinges or hinge-blanks, two and one half of one cent per pound.

Iron or steel blacksmiths' hammers and sledges, track-tools, wedges, and crowbars, two and one half of one cent per pound.

Iron or steel axles, parts thereof, axle-bars, axle-blanks, or forgings for axles, without reference to the stage or state of manufacture, two and one half of one cent per pound.

Forgings of iron and steel, or forged iron, of whatever shape, or in whatever stage of manufacture, not specially enumerated or provided for in this act, two and one half cents per pound.

Horsehoe-nails, hob-nails, and wire nails, and all

other wrought-iron or steel nails, not specially enumerated or provided for in this act, four cents per pound.

Boiler tubes, or flues, or stays of wrought-iron or steel, three cents per pound.

Other wrought-iron or steel tubes or pipes, two and one quarter cents per pound.

Chain or chains of all kinds, made of iron and steel, not less than three fourths of one inch in diameter, one and three quarter cents per pound; less than three fourths of one inch and not less than three eighths of one inch in diameter, two cents per pound; less than three eighths of one inch in diameter, two and one half cents per pound.

Cross-cut saws, eight cents per linear foot.

Mill, pit, and drag saws, not over nine inches wide, ten cents per linear foot; over nine inches wide, fifteen cents per linear foot.

Circular saws, thirty per centum ad valorem.

Hand, back, and all other saws, not specially enumerated or provided for in this act, forty per centum ad valorem.

Files, file-blanks, rasps, and floats of all cuts and kinds, four inches in length and under, thirty-five cents per dozen; over four inches in length and under nine inches, seventy-five cents per dozen; nine inches in length and under fourteen inches, one dollar and fifty cents per dozen; fourteen inches in length and over, two dollars and fifty cents per dozen.

Steel ingots, cogged ingots, blooms, and slabs, by whatever process made; die blocks or blanks; billets and bars and tapered or beveled bars; bands, hoops, strips and sheets, of all gauges and widths; plates of all thicknesses and widths; steamer, crank, and other shafts; wrist or crank-pins; connecting-rods and piston-rods; pressed, sheared, or stamped shapes, or blanks of sheet or plate steel, or combination of steel and iron, punched or not punched; hammer-molds or swaged steel; gun-molds, not in bars; alloys used as substitutes for steel tools; all descriptions and shapes of dry sand, loam, or iron-molded steel castings; all of the above classes of steel not otherwise specially provided for in this act, valued at four cents a pound or less, forty-five per centum ad valorem; above four cents a pound and not above seven cents per pound, two cents per pound; valued above seven cents a pound and not above ten cents per pound, two and [one fourth] three fourths cents per pound; valued at above ten cents per pound, three and one fourth cents per pound: Provided, That on all iron or steel bars, rods, strips, or steel sheets of whatever shape, and on all iron or steel bars of irregular shape or section, cold-rolled, cold-hammered, or polished in any way in addition to the ordinary process of hot-rolling or hammering, there shall be paid one fourth cent per pound in addition to the rates provided in this act, and on steel circular saw-plates there shall be paid one cent per pound in addition to the rate provided for in this act.

Iron or steel beams, girders, joists, angles, channels, car-truck channels, T's, columns and posts, or parts or sections of columns and posts, deck and bulb beams, and building forms, together with all other structural shapes of iron or steel, one and one fourth of one cent per pound.

Steel wheels and steel-tired wheels for railway purposes, whether wholly or partly finished, and iron or steel locomotive, car, and other railway tires, or parts thereof, wholly or partly manufactured, two and one half of one cent per pound; iron or steel ingots, cogged ingots, blooms or blanks for the same, without regard to the degree of manufacture, two cents per pound.

Iron or steel rivet, screw, nail, and fence-wire rods, round, in coils and loops, not lighter than number five wire gauge, valued at three and one half cents or less per pound, six tenths of one cent per pound. Iron or steel, flat with longitudinal ribs for the manufacture of fencing, six tenths of a cent per pound.

Screws, commonly called wood screws, two inches

or over in length, six cents per pound; one inch and less than two inches in length, eight cents per pound; over one half inch and less than one inch in length, ten cents per pound; one half inch and less in length, twelve cents per pound.

Iron or steel wire, smaller than number five and not smaller than number ten wire gauge, one and one half cents per pound; smaller than number ten and not smaller than number sixteen wire gauge, two cents per pound; smaller than number sixteen and not smaller than number twenty-six wire gauge, two and one half cents per pound; smaller than number twenty-six wire gauge, three cents per pound: Provided, That iron or steel wire, covered with cotton, silk, or other material, and wire commonly known as crinoline, corset, and hat wire, shall pay four cents per pound in addition to the foregoing rates: And provided further, That no article made from iron or steel wire, or of which iron or steel wire is a component part of chief value, shall pay a less rate of duty than the iron or steel wire from which it is made either wholly or in part: And provided further, That iron or steel wire cloths, and iron or steel wire nettings, made in meshes of any form, shall pay a duty equal in amount to that imposed on iron or steel wire of the same gauge, and two cents per pound in addition thereto. There shall be paid on galvanized iron or steel wire (except fence-wire), one half of one cent per pound in addition to the rate imposed on the wire of which it is made. On iron-wire rope and wire strand, one cent per pound in addition to the rates imposed on the wire of which it is made. On steel-wire rope and wire strand, two cents per pound in addition to the rates imposed on the wire of which it is made.

Steel not specially enumerated or provided for in this act, forty-five per centum ad valorem: Provided, That all metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, Bessemer, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by the combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable iron castings, shall be classed and denominated as steel.

No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any partly manufactured article of iron or steel, or upon any manufacture of iron and steel.

Argentine, albata, or German silver, unmanufactured, twenty-five per centum ad valorem.

Copper, imported in the form of ores, two and one half cents on each pound of fine copper contained therein; regulus of and black and coarse copper, and copper cement, three and one half cents on each pound of fine copper contained therein; old copper, fit only for remanufacture, clippings from new copper, and all composition metal of which copper is a component material of chief value not specially enumerated or provided for in this act, three cents per pound; copper in plates, bars, ingots, Chili or other pigs, and in other forms, not manufactured, or enumerated in this act, four cents per pound; in rolled plates, called brazier's copper, sheets, rods, pipes, and copper bottoms, and all manufactures of copper, or of which copper shall be a component of chief value, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Brass, in bars or pig, old brass, and clippings from brass or Dutch metal, one and one half cent per pound.

Lead-ore and lead-dross, one and one half cent per pound.

Lead, in pigs and bars, molten and old refuse lead run into blocks and bars, and old scrap-lead, fit only to be remanufactured, two cents per pound.

Lead, in sheets, pipes, or shot, three cents per pound.

Nickel, in ore, matte, or other crude form not ready for consumption in the arts, fifteen cents per pound on the nickel contained therein.

Nickel, nickel-oxide, alloy of any kind in which nickel is the element of chief value, fifteen cents per pound.

Zinc, spelter, or tutenague, in blocks or pigs, and old worn-out zinc, fit only to be remanufactured, one and one half cent per pound; zinc, spelter, or tutenague in sheets, two and one half cents per pound.

Sheathing, or yellow-metal, not wholly of copper, nor wholly nor in part of iron, ungalvanized, in sheets, forty-eight inches long and fourteen inches wide, and weighing from fourteen to thirty-four ounces per square foot, thirty-five per centum ad valorem.

Antimony, as regulus or metal, ten per centum ad valorem.

Bronze powder, fifteen per centum ad valorem.

Cutlery, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Dutch or bronze metal, in leaf, ten per centum ad valorem.

Steel plates, engraved, stereotype plates, and new types, twenty-five per centum ad valorem.

Gold-leaf, one dollar and fifty cents per package of five hundred leaves.

Hollow-ware, coated, glazed, or tinned, three cents per pound.

Muskets, rifles, and other fire-arms, not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

All sporting breech-loading shot-guns, and pistols of all kinds, thirty-five per centum ad valorem.

Forged shot-gun barrels, rough-bored, ten per centum ad valorem.

Needles for knitting or sewing machines, thirty-five per centum ad valorem.

Needles, sewing, darning, knitting, and all others not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

Pen-knives, pocket-knives, of all kinds, and razors, fifty per centum ad valorem; swords, sword-blades, and side-arms, thirty-five per centum ad valorem.

Pens, metallic, twelve cents per gross; pen-holder tips and pen-holders, or parts thereof, [forty] thirty per centum ad valorem.

Pins, solid-head or other, thirty per centum ad valorem.

Britannia ware, and plated and gilt articles and wares of all kinds, thirty-five per centum ad valorem.

Quicksilver, ten per centum ad valorem.

Silver-leaf, seventy-five cents per package of five hundred leaves.

Type-metal, twenty per centum ad valorem.

Chromate of iron, or chromic ore, fifteen per centum ad valorem.

Mineral substances in a crude state, and metals unwrought, not specially enumerated or provided for in this act, twenty per centum ad valorem.

Manufactures, articles or wares, not specially enumerated or provided for in this act, composed wholly or in part of iron, steel, copper, lead, nickel, pewter, tin, zinc, gold, silver, platinum, or any other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

SCHEDULE D.—WOOD AND WOODEN-WARES.

Timber, hewn and sawed, and timber used for spars and in building wharves, twenty per centum ad valorem.

Timber, squared or sided, not specially enumerated or provided for in this act, one cent per cubic foot.

Sawed boards, planks, deals, and other lumber of hemlock, white-wood, sycamore, and bass-wood, one dollar per one thousand feet, board measure; all

other articles of sawed lumber, two dollars per one thousand feet, board measure. But when lumber of any sort is planed or finished, in addition to the rates herein provided, there shall be levied and paid for each side so planed or finished, fifty cents per one thousand feet, board measure.

And if planed on one side and tongued and grooved, one dollar per one thousand feet, board measure.

And if planed on two sides, and tongued and grooved, one dollar and fifty cents per one thousand feet, board measure.

Hubs for wheels, posts, last-blocks, wagon-blocks, ore-blocks, gun-blocks, heading-blocks, and all like blocks or sticks, rough-hewn or sawed only, twenty per centum ad valorem.

Staves of wood of all kinds, ten per centum ad valorem.

Pickets and palings, twenty per centum ad valorem.

Laths, fifteen cents per one thousand pieces.

Shingles, thirty-five cents per one thousand.

Pine clapboards, two dollars per one thousand.

Spruce clapboards, one dollar and fifty cents per one thousand.

House or cabinet furniture, in piece or rough, and not finished, thirty per centum ad valorem.

Cabinet-ware and house furniture, finished, thirty-five per centum ad valorem.

Casks and barrels empty, sugar-box shooks, and packing-boxes, and packing-box shooks, of wood, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Manufactures of cedar-wood, granadilla, ebony, mahogany, rose-wood, and satin-wood, thirty-five per centum ad valorem.

Manufactures of wood, or of which wood is the chief component part, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Wood, unmanufactured, not specially enumerated or provided for in this act, twenty per centum ad valorem.

SCHEDULE E.—SUGAR.

All sugars not above No. 18 Dutch standard in color shall pay duty on their polariscopic test as follows, viz.:

All sugars not above No. 18 Dutch standard in color, all tank bottoms, sirups of cane-juice or of beet-juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, shall pay a duty of one and forty hundredths cent per pound, and for every additional degree or fraction of a degree shown by the polariscopic test, they shall pay four hundredths of a cent per pound additional.

All sugars above No. 18 Dutch standard in color shall be classified by the Dutch standard of color, and pay duty as follows, namely:

All sugar above No. 18 and not above No. 16 Dutch standard, two and seventy-five hundredths cents per pound.

All sugar above No. 16 and not above No. 20 Dutch standard, three cents per pound.

All sugars above No. 20 Dutch standard, three and fifty hundredths cents per pound.

Molasses testing not above fifty-six degrees by the polariscope, shall pay a duty of four cents per gallon; molasses testing above fifty-six degrees, shall pay a duty of eight cents per gallon.

Sugar-candy, not colored, five cents per pound.

All other confectionery, not specially enumerated or provided for in this act, made wholly or in part of sugar, and on sugars after being refined, when tintured, colored, or in any way adulterated, valued at thirty cents per pound or less, ten cents per pound.

Confectionery valued above thirty cents per pound, or when sold by the box, package, or otherwise than by the pound, fifty per centum ad valorem.

SCHEDULE F.—TOBACCO.

Cigars, cigarettes, and cheroots of all kinds, two dollars and fifty cents per pound and twenty-five per

centum ad valorem; but paper cigars and cigarettes, including wrappers, shall be subject to the same duties as are herein imposed upon cigars.

Leaf-tobacco, of which eighty-five per cent. is of the requisite size and of the necessary fineness of texture to be suitable for wrappers, and of which more than one hundred leaves are required to weigh a pound, if not stemmed, seventy-five cents per pound; if stemmed, one dollar per pound.

All other tobacco in leaf, unmanufactured, and not stemmed, thirty-five cents per pound.

Tobacco-stems, fifteen cents per pound.

Tobacco, manufactured, of all descriptions, and stemmed tobacco, not specially enumerated or provided for in this act, forty cents per pound.

Snuff and snuff-flour, manufactured of tobacco, ground, dry, or damp, and pickled, scented or otherwise, of all descriptions, fifty cents per pound.

Tobacco, unmanufactured, not specially enumerated or provided for in this act, thirty per centum ad valorem.

SCHEDULE G.—PROVISIONS.

Animals, live, twenty per centum ad valorem.

Beef and pork, one cent per pound.

Hams and bacon, two cents per pound.

Meat, extract of, twenty per centum ad valorem.

Cheese, four cents per pound.

Butter, and substitutes therefor, four cents per pound.

Lard, two cents per pound.

Wheat, twenty cents per bushel.

Rye and barley, ten cents per bushel.

Barley, pearled, patent, or hulled, one half cent per pound.

Barley-malt, per bushel of thirty-four pounds, twenty cents.

Indian corn or maize, ten cents per bushel.

Oats, ten cents per bushel.

Corn-meal, ten cents per bushel of forty-eight pounds.

Oatmeal, one half cent per pound.

Eye-flour, one half cent per pound.

Wheat-flour, twenty per centum ad valorem.

Potato or corn starch, two cents per pound; rice-starch, two and a half cents per pound; other starch, two and a half cents per pound.

Rice, cleaned, two and one fourth cents per pound; uncleaned, one and one half cent per pound.

Paddy, one and one fourth cent per pound.

Rice-flour and rice-meal, twenty per centum ad valorem.

Hay, two dollars per ton.

Honey, twenty cents per gallon.

Hops, eight cents per pound.

Milk, preserved or condensed, twenty per centum ad valorem.

Fish:

Mackerel, one cent per pound.

Herrings, pickled or salted, one half of one cent per pound.

Salmon, pickled, one cent per pound; other fish, pickled, in barrels, one cent per pound.

Foreign-caught fish, imported otherwise than in barrels or half-barrels, whether fresh, smoked, dried, salted, or pickled, not specially enumerated or provided for in this act, fifty cents per hundred pounds.

Anchovies and sardines, packed in oil or otherwise, in tin boxes measuring not more than five inches long, four inches wide, and three and one half inches deep, ten cents per whole box; in half-boxes, measuring not more than five inches long, four inches wide, and one and five eighths deep, five cents each; in quarter-boxes, measuring not more than four inches and three quarters long, three and one half inches wide, and one and a quarter deep, two and one half cents each; when imported in any other form, forty per centum ad valorem.

Fish preserved in oil, except anchovies and sardines, thirty per centum ad valorem.

Salmon, and all other fish, prepared or preserved,

and prepared meats of all kinds, not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

Pickles and sauces, of all kinds, not otherwise specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Potatoes, fifteen cents per bushel of sixty pounds.

Vegetables, in their natural state, or in salt or brine, not specially enumerated or provided for in this act, ten per centum ad valorem.

Vegetables, prepared or preserved, of all kinds, not otherwise provided for, thirty per centum ad valorem.

Chicocory-root, ground or unground, burnt or prepared, two cents per pound.

Vinegar, seven and one half cents per gallon. The standard for vinegar shall be taken to be that strength which requires thirty-five grains of bicarbonate of potash to neutralize one ounce troy of vinegar; and all import duties that may by law be imposed on vinegar imported from foreign countries shall be collected according to this standard.

Acorns and dandelion-root, raw or prepared, and all other articles used or intended to be used as coffee, or as substitutes therefor, not specially enumerated or provided for in this act, two cents per pound.

Chocolate, two cents per pound.

Cocoa, prepared or manufactured, two cents per pound.

Fruits:

Currants, Zante or other, one cent per pound.

Dates, plums, and prunes, one cent per pound.

Figs, two cents per pound.

Oranges, in boxes of capacity not exceeding two and one half cubic feet, twenty-five cents per box; in one half boxes, capacity not exceeding one and one fourth cubic feet, thirteen cents per half-box; in bulk, one dollar and sixty cents per thousand; in barrels, capacity not exceeding that of the one hundred and ninety-six pounds flour-barrel, fifty-five cents per barrel.

Lemons, in boxes of capacity not exceeding two and one half cubic feet, thirty cents per box; in one half boxes, capacity not exceeding one and one fourth cubic feet, sixteen cents per half-box; in bulk, two dollars per thousand.

Lemons and oranges, in packages, not specially enumerated or provided for in this act, twenty per centum ad valorem.

Limes and grapes, twenty per centum ad valorem.

Raisins, two cents per pound.

Fruits, preserved in their own juices, and fruit-juice, twenty per centum ad valorem.

Comfits, sweetmeats, or fruits preserved in sugar,

spirits, sirup, or molasses, not otherwise specified or provided for in this act, and jellies of all kinds, thirty-five per centum ad valorem.

Nuts:

Almonds, five cents per pound; shelled, seven and one half cents per pound; filberts, and walnuts, of all kinds, three cents per pound.

Peanuts or ground beans, one cent per pound; shelled, one and one half cent per pound.

Nuts of all kinds, shelled or unshelled, not specially enumerated or provided for in this act, two cents per pound.

Mustard, ground or preserved, in bottles or otherwise, ten cents per pound.

SCHEDULE H.—LIQUORS.

Champagne, and all other sparkling wines, in bottles containing each not more than one quart and more than one pint, seven dollars per dozen bottles; containing not more than one pint each and more than one half pint, three dollars and fifty cents per dozen bottles; containing one half pint each, or less, one dollar and seventy-five cents per dozen bottles; in bottles containing more than one quart each, in addition to seven dollars per dozen bottles, at the rate of two dollars and twenty-five cents per gallon on the quantity in excess of one quart bottle.

Still wines in casks, fifty cents per gallon; in bot-

tles, one dollar and sixty cents per case of one dozen bottles containing each not more than one quart and more than one pint, or twenty-four bottles containing each not more than one pint; and any excess beyond these quantities found in such bottles shall be subject to a duty of five cents per pint or fractional part thereof; but no separate or additional duty shall be collected on the bottles: *Provided*, That any wines imported containing more than twenty-four per centum of alcohol shall be forfeited to the United States: *Provided further*, That there shall be no allowance for breakage, leakage, or damage on wines, liquors, cordials, or distilled spirits.

Vermuth, the same duty as on still wines.

Wines, brandy, and other spirituous liquors imported in bottles, shall be packed in packages containing not less than one dozen bottles in each package; and all such bottles, except as specially enumerated or provided for in this act, shall pay an additional duty of three cents for each bottle.

Brandy, and other spirits manufactured or distilled from grain or other materials and not specially enumerated or provided for in this act, two dollars per proof gallon; each and every gauge or wine gallon of measurement shall be counted as at least one proof gallon; and the standard for determining the proof of brandy and other spirits or liquors of any kind imported shall be the same as that which is defined in the laws relating to internal revenue; but any brandy or other spirituous liquors imported in casks of less capacity than fourteen gallons shall be forfeited to the United States.

On all compounds or preparations of which distilled spirits are a component part of chief value, not specially enumerated or provided for in this act, there shall be levied a duty not less than that imposed upon distilled spirits.

Cordials, liquors, arrack, absinthe, kirschwasser, ratafia, and other similar spirituous beverages or bitters, containing spirits, and not specially enumerated or provided for in this act, two dollars per proof gallon.

No lower rate or amount of duty shall be levied, collected, and paid on brandy, spirits, and other spirituous beverages than that fixed by law for the description of first proof; but it shall be increased in proportion for any greater strength than the strength of first proof; and all imitations of brandy or spirits or wines imported by any names whatever shall be subject to the highest rate of duty provided for the genuine articles respectively intended to be represented, and in no case less than one dollar per gallon.

Bay-rum or bay-water, whether distilled or compounded, one dollar per gallon of first proof, and in proportion for any greater strength than first proof.

Ale, porter, and beer, in bottles or jugs of glass, stone or earthenware, thirty-five cents per gallon; otherwise than in bottles or jugs of glass, stone, or earthenware, twenty cents per gallon.

Ginger ale or ginger beer, twenty per centum ad valorem, but no separate or additional duty shall be collected on bottles or jugs containing the same.

SCHEDULE I.—COTTON AND COTTON GOODS.

Cotton thread, yarn, warps, or warp-yarn, whether single or advanced beyond the condition of single, by twisting two or more single yarns together, whether on beams or in bundles, skeins or cops, or in any other form, valued at not exceeding twenty-five cents per pound, ten cents per pound; valued at over twenty-five cents per pound, and not exceeding forty cents per pound, fifteen cents per pound; valued at over forty cents per pound, and not exceeding fifty cents per pound, twenty cents per pound; valued at over fifty cents per pound and not exceeding sixty cents per pound, twenty-five cents per pound; valued at over sixty cents per pound and not exceeding seventy cents per pound, thirty-three cents per pound; valued at over seventy cents per pound and not exceeding eighty cents per pound, thirty-eight cents per pound; valued at over eighty cents per pound, and

not exceeding one dollar per pound, forty-eight cents per pound; valued at over one dollar per pound, fifty per centum ad valorem.

On all cotton cloth not bleached, dyed, colored, stained, painted, or printed, and not exceeding one hundred threads to the square inch, counting the warp and filling, two and one half cents per square yard; if bleached, three and one half cents per square yard; if dyed, colored, stained, painted, or printed, four and one half cents per square yard.

On all cotton cloth, not bleached, dyed, colored, stained, painted, or printed, exceeding one hundred and not exceeding two hundred threads to the square inch, counting the warp and filling, three cents per square yard; if bleached, four cents per square yard; if dyed, colored, stained, painted, or printed, five cents per square yard: *Provided*, That on all cotton cloth not exceeding two hundred threads to the square inch, counting the warp and filling, not bleached, dyed, colored, stained, painted, or printed, valued at over eight cents per square yard; bleached, valued at over ten cents per square yard; dyed, colored, stained, painted, or printed, valued at over thirteen cents per square yard, there shall be levied, collected, and paid a duty of forty per centum ad valorem.

On all cotton cloth exceeding two hundred threads to the square inch, counting the warp and filling, not bleached, dyed, colored, stained, painted, or printed, four cents per square yard; if bleached, five cents per square yard, if dyed, colored, stained, painted, or printed, six cents per square yard: *Provided*, That on all such cotton cloths not bleached, dyed, colored, stained, painted, or printed, valued at over ten cents per square yard; bleached, valued at over twelve cents per square yard; and dyed, colored, stained, painted, or printed, valued at over fifteen cents per square yard, there shall be levied, collected, and paid a duty of forty per centum ad valorem.

On stockings, hose, half-hose, shirts, and drawers, and all goods made on knitting-machines or frames, composed wholly of cotton, and not herein otherwise provided for, thirty-five per centum ad valorem.

On stockings, hose, half-hose, shirts, and drawers, fashioned, narrowed, or shaped wholly or in part by knitting-machines or frames, or knit by hand, and composed wholly of cotton, forty per centum ad valorem.

Cotton cords, braids, gimps, galloons, webbing, goring, suspenders, braces, and all manufactures of cotton not specially enumerated or provided for in this act, and corsets, of whatever material composed, thirty-five per centum ad valorem.

Cotton laces, embroideries, insertings, trimmings, lace window-curtains, cotton damask, hemmed handkerchiefs, and cotton-velvet, forty per centum ad valorem.

Spool-thread of cotton, seven cents per dozen spools, containing on each spool not exceeding one hundred yards of thread; exceeding one hundred yards on each spool, for every additional one hundred yards of thread or fractional part thereof in excess of one hundred yards, seven cents per dozen.

SCHEDULE J.—HEMP, JUTE, AND FLAX GOODS.

Flax-straw, five dollars per ton.

Flax, not hackled or dressed, twenty dollars per ton.

Flax, hackled, known as "dressed line," forty dollars per ton.

Tow, of flax or hemp, ten dollars per ton.

Hemp, manila, and other like substitutes for hemp not specially enumerated or provided for in this act, twenty-five dollars per ton.

Jute-butts, five dollars per ton.

Jute, twenty per centum ad valorem; sunn, Sisal grass, and other vegetable substances, not specially enumerated or provided for in this act, fifteen dollars per ton.

Brown and bleached linens, ducks, canvases, pad-dings, cot-bottoms, diapers, crash, huckabacks, hand-

kerchiefs, lawns, or other manufactures of flax, jute, or hemp, or of which flax, jute, or hemp shall be the component material of chief value, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Flax, hemp, and jute-yarns, thirty-five per centum ad valorem.

Flax or linen thread, twine, and pack-thread, and all manufactures of flax, or of which flax shall be the component material of chief value, not specially enumerated or provided for in this act, forty per centum ad valorem.

Flax or linen laces and insertings, embroideries, or manufactures of linen, if embroidered or tamboured in the loom or otherwise, by machinery or with the needle or other process, and not specially enumerated or provided for in this act, thirty per centum ad valorem.

Burlaps, not exceeding sixty inches in width, of flax, jute, or hemp, or of which flax, jute, or hemp, or either of them, shall be the component material of chief value (except such as may be suitable for bagging for cotton), thirty per centum ad valorem.

Oil-cloth foundations, or floor-cloth canvas, or burlaps exceeding sixty inches in width, made of flax, jute, or hemp, or of which flax, jute, or hemp, or either of them, shall be the component material of chief value, forty per centum ad valorem.

Oil-cloths for floors, stamped, painted, or printed, and on all other oil-cloth (except silk oil-cloth), and on water-proof cloth, not otherwise provided for, forty per centum ad valorem.

Gunny-cloth, not bagging, valued at ten cents or less per square yard, three cents per pound; valued at over ten cents per square yard, four cents per pound.

Bags and bagging, and like manufactures, not specially enumerated or provided for in this act (except bagging for cotton), composed wholly or in part of flax, hemp, jute, gunny-cloth, gunny-bags, or other material, forty per centum ad valorem.

Bagging for cotton, or other manufactures not specially enumerated or provided for in this act, suitable to the uses for which cotton-bagging is applied, composed in whole or in part of hemp, jute, jute-butts, flax, gunny-bags, gunny-cloth, or other material, and valued at seven cents or less per square yard, one and one half cents per pound; valued at over seven cents per square yard, two cents per pound.

Tarred cables or cordage, three cents per pound.

Untarred manila cordage, two and one half cents per pound.

All other untarred cordage, three and one half cents per pound.

Seines and seine and gilling twine, twenty-five per centum ad valorem.

Sail-duck, or canvas for sails, thirty per centum ad valorem.

Russia and other sheetings, of flax or hemp, brown or white, thirty-five per centum ad valorem.

All other manufactures of hemp, or manila, or of which hemp or manila shall be a component material of chief value, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Grass-cloth and other manufactures of jute, ramp, China and Seal grass, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

SCHEDULE K.—WOOL AND WOOLENS.

All wools, hair of the alpaca, goat, and other like animals, shall be divided, for the purpose of fixing the duties to be charged thereon, into the three following classes:

Class one, clothing wools.—That is to say, merino, mestiza, metz or metis wools, or other wools of merino blood, immediate or remote, down clothing wools, and wools of like character with any of the preceding, including such as have been heretofore usually imported into the United States from Buenos Ayres, New Zealand, Australia, Cape of Good Hope, Russia,

Great Britain, Canada, and elsewhere, and also including all wools not hereinafter described or designated in classes two and three.

Class two, combing wools.—That is to say, Leicester, Cotswold, Lincolnshire, Down combing wools, Canada long wools, or other like combing wools of English blood, and usually known by the terms herein used, and also all hair of the alpaca, goat, and other like animals.

Class three, carpet wools and other similar wools.—Such as Donkoi, native South American, Cordova, Valparaiso, native Smyrna, and including all such wools of like character as have been heretofore usually imported into the United States from Turkey, Greece, Egypt, Syria, and elsewhere.

The duty on wools of the first class which shall be imported washed shall be twice the amount of the duty to which they would be subjected if imported unwashed; and the duty on wools of all classes which shall be imported scoured shall be three times the duty to which they would be subjected if imported unwashed. The duty upon wool of the sheep, or hair of the alpaca, goat, and other like animals, which shall be imported in any other than ordinary condition, as now and heretofore practiced, or which shall be changed in its character or condition for the purpose of evading the duty, or which shall be reduced in value by the admixture of dirt or any other foreign substance, shall be twice the duty to which it would be otherwise subject.

Wools of the first class, the value whereof at the last port or place whence exported to the United States, excluding charges in such port, shall be thirty cents or less per pound, ten cents per pound; wools of the same class, the value whereof at the last port or place whence exported to the United States, excluding charges in such port, shall exceed thirty cents per pound, twelve cents per pound.

Wools of the second class, and all hair of the alpaca, goat, and other like animals, the value whereof, at the last port or place whence exported to the United States, excluding charges in such port, shall be thirty cents or less per pound, ten cents per pound; wools of the same class, the value whereof at the last port or place whence exported to the United States, excluding charges in such port, shall exceed thirty cents per pound, twelve cents per pound.

Wools of the third class, the value whereof, at the last port or place whence exported to the United States, excluding charges in such port, shall be twelve cents or less per pound, two and a half cents per pound; wools of the same class, the value whereof, at the last port or place whence exported to the United States, excluding charges in such port, shall exceed twelve cents per pound, five cents per pound.

Wools on the skin, the same rates as other wools, the quantity and value to be ascertained under such rules as the Secretary of the Treasury may prescribe.

Woolen rags, shoddy, mungo, waste, and flocks, ten cents per pound.

Woolen cloths, woolen shawls, and all manufactures of wool of every description, made wholly or in part of wool, not specially enumerated or provided for in this act, valued at not exceeding eighty cents per pound, thirty-five cents per pound and thirty-five per centum ad valorem; valued at above eighty cents per pound, thirty-five cents per pound, and in addition thereto forty per centum ad valorem.

Flannels, blankets, hats of wool, knit goods, and all goods made on knitting-frames, balwoals, woolen and worsted yarns, and all manufactures of every description, composed wholly or in part of worsted, the hair of the alpaca, goat, or other animals (except such as are composed in part of wool), not specially enumerated or provided for in this act, valued at not exceeding thirty cents per pound, ten cents per pound; valued at above thirty cents per pound, and not exceeding forty cents per pound, twelve cents per pound; valued at above forty cents per pound, and not exceeding sixty cents per pound, eighteen cents per

pound; valued at above sixty cents per pound, and not exceeding eighty cents per pound, twenty-four cents per pound; and in addition thereto, upon all the above-named articles, thirty-five per centum ad valorem; valued at above eighty cents per pound, thirty-five cents per pound, and in addition thereto forty per centum ad valorem.

Bunting, ten cents per square yard, and in addition thereto, thirty-five per centum ad valorem.

Women's and children's dress-goods, coat-linings, Italian cloths, and goods of like description, composed in part of wool, worsted, the hair of the alpaca, goat, or other animals, valued at not exceeding twenty cents per square yard, five cents per square yard, and in addition thereto, thirty-five per centum ad valorem; valued at above twenty cents per square yard, seven cents per square yard, and forty per centum ad valorem; if composed wholly of wool, worsted, the hair of the alpaca, goat, or other animals, or of a mixture of them, nine cents per square yard and forty per centum ad valorem, but all such goods with selvages, made wholly or in part of other materials, or with threads of other materials introduced for the purpose of changing the classification, shall be dutiable at nine cents per square yard and forty per centum ad valorem: *Provided*, That all such goods weighing over four ounces per square yard shall pay a duty of thirty-five cents per pound and forty per centum ad valorem.

Clothing, ready-made, and wearing-apparel of every description, not specially enumerated or provided for in this act, and balmoral skirts, and skirting, and goods of similar description, or used for like purposes, composed wholly or in part of wool, worsted, the hair of the alpaca, goat, or other animals, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer, except knit goods, forty cents per pound, and in addition thereto, thirty-five per centum ad valorem.

Cloaks, dolmans, jackets, talmas, ulsters, or other outside garments for ladies and children's apparel, and goods of similar description, or used for like purposes, composed wholly or in part of wool, worsted, the hair of the alpaca, goat, or other animals, made up or manufactured wholly or in part by the tailor, seamstress, or manufacturer (except knit goods), forty-five cents per pound, and in addition thereto, forty per centum ad valorem.

Webbings, gorings, suspenders, braces, beltings, bindings, braids, galloons, fringes, gimps, cords, cords and tassels, dress-trimmings, head-nets, buttons, or barrel-buttons, or buttons of other forms for tassels or ornaments, wrought by hand or braided by machinery, made of wool, worsted, the hair of the alpaca, goat, or other animals, or of which wool, worsted, the hair of the alpaca, goat, or other animals is a component material, thirty cents per pound, and in addition thereto, fifty per centum ad valorem.

Aubusson, Axminster, and chenille carpets, and carpets woven whole for rooms, forty-five cents per square yard, and in addition thereto, thirty per centum ad valorem.

Saxony, Wilton, and Tournay velvet carpets, forty-five cents per square yard, and in addition thereto, thirty per centum ad valorem.

Brussels carpets, thirty cents per square yard, and in addition thereto, thirty per centum ad valorem.

Patent velvet and tapestry velvet carpets, printed on the warp or otherwise, twenty-five cents per square yard, and in addition thereto, thirty per centum ad valorem.

Tapestry Brussels carpets, printed on the warp or otherwise, twenty cents per square yard, and in addition thereto, thirty per centum ad valorem.

Treble ingrain, three-ply, and worsted-chain Venetian carpets, twelve cents per square yard, and in addition thereto, thirty per centum ad valorem.

Yarn Venetian, and two-ply ingrain carpets, eight cents per square yard, and in addition thereto, thirty per centum ad valorem.

Druggets and bookings, printed, colored, or other-

wise, fifteen cents per square yard, and in addition thereto, thirty per centum ad valorem.

Hemp or jute carpeting, six cents per square yard.

Carpets and carpetings of wool, flax, or cotton, or parts of either or other material, not otherwise herein specified, forty per centum ad valorem; and mats, rugs, screens, covers, hassocks, bed-sides, and other portions of carpets or carpetings, shall be subjected to the rate of duty herein imposed on carpets or carpeting of like character or description; and the duty on all other mats not exclusively of vegetable material, screens, hassocks, and rugs, shall be forty per centum ad valorem.

Endless belts or felts for paper or printing-machines, twenty cents per pound and thirty per centum ad valorem.

SCHEDULE L.—SILK AND SILK GOODS.

Silk, partially manufactured from cocoons, or from waste silk, and not further advanced or manufactured than carded or combed silk, fifty cents per pound.

Thrown silk, in gum, not more advanced than singles, tram, organzine, sewing-silk, twist, floss, in the gum, and spun silk, silk threads or yarns, of every description, purified or dyed, thirty per centum ad valorem.

On lastings, mohair cloths, silk twist, or other manufactures of cloth, woven or made in patterns of such size, shape, or form, or cut in such manner as to be fit for buttons exclusively, ten per centum ad valorem.

All goods, wares, merchandise, not specially enumerated or provided for in this act, made of silk, or of which silk is the component material of chief value, fifty per centum ad valorem.

SCHEDULE M.—BOOKS, PAPERS, ETC.

Books, pamphlets, bound or unbound, and all printed matter, not specially enumerated or provided for in this act, engravings, bound or unbound, etchings, illustrated books, maps, and charts, twenty-five per centum ad valorem.

Blank-books, bound or unbound, and blank-books for press-copying, twenty per centum ad valorem.

Paper, sized or glued, suitable only for printing-paper, twenty per centum ad valorem.

Printing-paper, unsized, used for books and newspapers exclusively, fifteen per centum ad valorem.

Paper, manufactures of, or of which paper is a component material, not specially enumerated or provided for in this act, fifteen per centum ad valorem.

Sheathing-paper, ten per centum ad valorem.

Paper boxes, and all other fancy boxes, thirty-five per centum ad valorem.

Paper envelopes, twenty-five per centum ad valorem.

Paper-hangings and paper for screens or fire-boards, paper antiquarian, demy, drawing, elephant, foolscap, imperial, letter, note, and all other paper not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

Pulp, dried, for paper-makers' use, ten per centum ad valorem.

SCHEDULE N.—SUNDRIES.

Alabaster and spar statuary and ornaments, ten per centum ad valorem.

Baskets and all other articles composed of grass, osier, palm-leaf, whalebone, or willow, or straw, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Beads, and bead ornaments of all kinds, except amber, fifty per centum ad valorem.

Blacking of all kinds, twenty-five per centum ad valorem.

Bladders, manufactures of, twenty-five per centum ad valorem.

Bone, horn, ivory, or vegetable ivory, all manufactures of, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Bonnets, hats, and hoods for men, women, and children, composed of chip, grass, palm-leaf, willow, or straw, or any other vegetable substance, hair,

whalebone, or other material, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Bouillons, or cannetille, metal threads, filé, or g-spinst, twenty-five per centum ad valorem.

Bristles, fifteen cents per pound.

Brooms of all kinds, twenty-five per centum ad valorem.

Brushes of all kinds, thirty per centum ad valorem. Bulbs and bulbous roots, not medicinal, and not specially enumerated or provided for in this act, twenty per centum ad valorem.

Burr-stones, manufactured or bound up into millstones, twenty per centum ad valorem.

Buttons and button-molds, not specially enumerated or provided for in this act, not including brass, gilt, or silk buttons, twenty-five per centum ad valorem.

Candles and tapers of all kinds, twenty per centum ad valorem.

Canes and sticks for walking, finished, thirty-five per centum ad valorem; if unfinished, twenty per centum ad valorem.

Card-cases, pocket-books, shell boxes, and all similar articles, of whatever material composed, and by whatever name known, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Card-clothing, twenty-five cents per square foot; when manufactured from tempered steel wire, forty-five cents per square foot.

Carriages, and parts of, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Chronometers, box or ship's, and parts thereof, ten per centum ad valorem.

Clocks, and parts of clocks, thirty per centum ad valorem.

Coach and harness furniture of all kinds, saddlery, coach, and harness hardware, silver-plated, brass, brass-plated, or covered, common, tinned, burnished, or japanned, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Coal, slack or culm, such as will pass through a half-inch screen, thirty cents per ton of twenty-eight bushels, eighty pounds to the bushel.

Coal, bituminous, and shale, seventy-five cents per ton of twenty-eight bushels, eighty pounds to the bushel. A drawback of seventy-five cents per ton shall be allowed on all bituminous coal imported into the United States which is afterward used for fuel on board of vessels propelled by steam which are engaged in the coasting trade of the United States, or in the trade with foreign countries, to be allowed and paid under such regulations as the Secretary of the Treasury shall prescribe.

Coke, twenty per centum ad valorem.

Combs, of all kinds, thirty per centum ad valorem. Compositions of glass or paste, when not set, ten per centum ad valorem.

Coral, cut, manufactured, or set, twenty-five per centum ad valorem.

Corks and cork-bark, manufactured, twenty-five per centum ad valorem.

Crayons of all kinds, twenty per centum ad valorem.

Dice, draughts, chess-men, chess-balls, and billiard and bagatelle balls, of ivory or bone, fifty per centum ad valorem.

Dolls and toys, thirty-five per centum ad valorem. Emery-grains and emery manufactured, ground, pulverized, or refined, one cent per pound.

Epaulets, galleons, laoes, knots, stars, tassels, and wings, of gold, silver, or other metal, twenty-five per centum ad valorem.

Fans, of all kinds, except common palm-leaf fans, of whatever material composed, thirty-five per centum ad valorem.

Feathers, of all kinds, crude or not dressed, colored or manufactured, twenty-five per centum ad valorem; when dressed, colored, or manufactured, including

dressed and finished birds, for millinery ornaments, and artificial and ornamental feathers and flowers, or parts thereof, of whatever material composed, for millinery use, not specially enumerated or provided for in this act, fifty per centum ad valorem.

Finishing powder, twenty per centum ad valorem.

Fire-crackers, of all kinds, one hundred per centum ad valorem.

Floor-matting and floor-mats, exclusively of vegetable substances, twenty per centum ad valorem.

Friction or lucifer matches of all descriptions, thirty-five per centum ad valorem.

Fulminates, fulminating powders, and all like articles, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Fur, articles made of, and not specially enumerated or provided for in this act, thirty per centum ad valorem.

Gloves, kid or leather, of all descriptions, wholly or partially manufactured, fifty per centum ad valorem.

Grease, all not specially enumerated or provided for in this act, ten per centum ad valorem.

Grindstones, finished or unfinished, one dollar and seventy-five cents per ton.

Gunpowder, and all explosive substances used for mining, blasting, artillery, or sporting purposes, when valued at twenty cents or less per pound, six cents per pound; valued above twenty cents per pound, ten cents per pound.

Gun-wads, of all descriptions, thirty-five per centum ad valorem.

Gutta-percha, manufactured, and all articles of, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

Hair, human, bracelets, braids, chains, rings, curls, and ringlets, composed of hair, or of which hair is the component material of chief value, thirty-five per centum ad valorem.

Curled hair, except of hogs, used for beds or mattresses, twenty-five per centum ad valorem.

Human hair, raw, uncleaned and not drawn, twenty per centum ad valorem. If clean or drawn, but not manufactured, thirty per centum ad valorem; when manufactured, thirty-five per centum ad valorem.

Hair-cloth, known as "crinoline-cloth," and all other manufactures of hair not specially enumerated or provided for in this act, thirty per centum ad valorem.

Hair-cloth, known as "hair-seating," thirty cents per square yard.

Hair pencils, thirty per centum ad valorem.

Hats, etc., materials for: Braids, plaits, flats, laoes, trimmings, tissues, willow sheets and squares, used for making or ornamenting hats, bonnets, and hoods, composed of straw, chip, grass, palm-leaf, willow, hair, whalebone, or any other substance or material, not specially enumerated or provided for in this act, twenty per centum ad valorem.

Hat-bodies of cotton, thirty-five per centum ad valorem.

Hatters' furs, not on the skin, and dressed furs on the skin, twenty per centum ad valorem.

Hatters' plush, composed of silk or of silk and cotton, twenty-five per centum ad valorem.

Hemp-seed and rape-seed, and other oil-seeds of like character, other than linseed or flaxseed, one quarter of one cent per pound.

India-rubber fabrics, composed wholly or in part of India-rubber, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Articles composed of India-rubber, not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

India-rubber boots and shoes, twenty-five per centum ad valorem.

Inks of all kinds and ink-powders, thirty per centum ad valorem.

Japanned ware of all kinds, not specially enumerated or provided for in this act, forty per centum ad valorem.

Jet, manufactures and imitations of, twenty-five per centum ad valorem.

Jewelry of all kinds, twenty-five per centum ad valorem.

Leather, bend or belting leather, and Spanish or other sole-leather, and leather not specially enumerated or provided for in this act, fifteen per centum ad valorem.

Calf-skins, tanned, or tanned and dressed, and dressed upper leather of all other kinds, and skins dressed and finished, of all kinds, not specially enumerated or provided for in this act, and skins of morocco, finished, twenty per centum ad valorem.

Skins for morocco, tanned, but unfinished, ten per centum ad valorem.

All manufactures and articles of leather, or of which leather shall be a component part, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Lime, ten per centum ad valorem.

Garden-seeds, except seed of the sugar-beet, twenty per centum ad valorem.

Linseed or flaxseed, twenty cents per bushel of fifty-six pounds; but no drawback shall be allowed on oil-cake made from imported seed.

Marble of all kinds, in block, rough, or squared, sixty-five cents per cubic foot; veined marble, sawed, dressed, or otherwise, including marble slabs and marble paving-tiles, one dollar and ten cents per cubic foot.

All manufactures of marble not specially enumerated or provided for in this act, fifty per centum ad valorem.

Musical instruments of all kinds, twenty-five per centum ad valorem.

Paintings, in oil or water colors, and statuary not otherwise provided for, thirty per centum ad valorem. But the term "statuary," as used in the laws now in force imposing duties on foreign importations, shall be understood to include professional productions of a statuary or of a sculptor only.

Oeair, or willow, prepared for basket-makers' use, twenty-five per centum ad valorem.

Papier-maché, manufactures, articles, and wares of, thirty per centum ad valorem.

Pencils of wood filled with lead or other material, and pencils of lead, fifty cents per gross, and thirty per centum ad valorem; pencil-leads, not in wood, ten per centum ad valorem.

Percussion-caps, forty per centum ad valorem.

Philosophical apparatus and instruments, thirty-five per centum ad valorem.

Pipes, pipe-bowls, and all smokers' articles whatsoever, not specially enumerated or provided for in this act, seventy per centum ad valorem; all common pipes of clay, thirty-five per centum ad valorem.

Plaster-of-Paris, when ground or calcined, twenty per centum ad valorem.

Playing-cards, one hundred per centum ad valorem.

Polishing-powders of every description, by whatever name known, including Frankfort black, and Berlin, Chinese, fig, and wash blue, twenty per centum ad valorem.

Precious stones, of all kinds, ten per centum ad valorem.

Rags, of whatever material composed, and not specially enumerated or provided for in this act, ten per centum ad valorem.

Rattans and reeds, manufactured, but not made up into completed articles, ten per centum ad valorem.

Salt, in bags, sacks, barrels, or other packages, twelve cents per one hundred pounds; in bulk, eight cents per one hundred pounds: *Provided*, That exporters of meats, whether packed or smoked, which have been cured in the United States with imported salt, shall, upon satisfactory proof, under such regulations as the Secretary of the Treasury shall prescribe, that such meats have been cured with imported salt, have refunded to them from the Treasury the duties paid on the salt so used in curing such exported

meats, in amounts not less than one hundred dollars: *And provided further*, That imported salt in bond may be used in curing fish taken by vessels licensed to engage in the fisheries, and in curing fish on the shores of the navigable waters of the United States, under such regulations as the Secretary of the Treasury shall prescribe; and upon proof that the salt has been used for either of the purposes stated in this proviso, the duties on the same shall be remitted.

Scagliola, and composition tops for tables or for other articles of furniture, thirty-five per centum ad valorem.

Sealing-wax, twenty per centum ad valorem.

Shells, whole or parts of, manufactured, of every description, not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

Stones, unmanufactured or undressed, freestone, granite, sandstone, and all building or monumental stone, except marble, not specially enumerated or provided for in this act, one dollar per ton; and upon stones as above, hewn, dressed, or polished, twenty per centum ad valorem.

Strings: All strings of catgut, or any other like material, other than strings for musical instruments, twenty-five per centum ad valorem.

Tallow, one cent per pound.

Teeth, manufactured, twenty per centum ad valorem.

Umbrella and parasol ribs, and stretcher-frames, tips, runners, handles, or other parts thereof, when made in whole or chief part of iron, steel, or any other metal, forty per centum ad valorem; umbrellas, parasols, and shades, when covered with silk or alpaca, fifty per centum ad valorem; all other umbrellas, forty per centum ad valorem.

Umbrellas, parasols, and sunshades, frames and sticks for, finished or unfinished, not specially enumerated or provided for in this act, thirty per centum ad valorem.

Waste, all not specially enumerated or provided for in this act, ten per centum ad valorem.

Watches, watch-cases, watch-movements, parts of watches, and watch-materials, not specially enumerated or provided for in this act, twenty-five per centum ad valorem.

Webbing, composed of cotton, flax, or any other materials, not specially enumerated or provided for in this act, thirty-five per centum ad valorem.

THE FREE LIST.

Sec. 2508. The following articles when imported shall be exempt from duty:

CHEMICALS.

Albumen, in any form or condition; lactarine.
Aconite.
Ambergris.
Annotto, roncou, rocou, or orleans, and all extracts of.
Balm of Gilead.
Blood, dried.
Bones, crude, not manufactured, burned, calcined, ground, or steamed.
Bone-dust and bone-ash for manufacture of phosphate and fertilizers.
Carbon, animal, fit for fertilizing only.
Guano, manures, and all substances expressly used for manure.
Musk, crude, in natural pod.
Civet, crude.
Cochineal.
Dyeing or tanning: Articles in a crude state used in dyeing or tanning, not specially enumerated or provided for in this act.
Fish-skins.
Hide-cuttings, raw, with or without hair, and all glue-stock.
Hoofs.
Horns, and parts of horns, unmanufactured, and horn strips and tips.

- Ipecac.
 Fish-bonnds or fish-bladders.
 Leather, old scraps.
 Leeches.
 Rennets, raw or prepared.
 Argal, or argol, or crude tartar.
 Asafetida.
 Barks, cinchona, or other barks used in the manu-
 facture of quinia.
 Brazil paste.
 Camphor, crude.
 Cassia, cassia-buds, cassia vera, unground.
 Charcoal.
 Cinnamon, and chips of, unground.
 Cloves and clove-stems, unground.
 Cocculus indicus.
 Cudbear.
 Curry and curry-powder.
 Cutch.
 Divi-divi.
 Dragon's blood.
 Ergot.
 Gambier.
 Ginger-root, unground.
 Indigo and artificial indigo.
 Iodine, crude.
 Jalap.
 Kelp.
 Lac dye, crude, seed, button, stick, and shell.
 Lac spirits.
 Lemon-juice and lime-juice.
 Licorice-root, unground.
 Litmus, prepared or not prepared.
 Mace.
 Madder and munjeet or Indian madder, ground or
 prepared, and extracts of.
 Manns.
 Myrobolan.
 Orchil, or orchil liquid.
 Nutmegs.
 Nux vomica.
 Ottaf of roses.
 Salicine.
 Oils:
 Almond.
 Amber, crude and rectified.
 Ambergris.
 Anise, or anise-seed.
 Aniline, crude.
 Aspic, or spike lavender.
 Bergamot.
 Cajeput.
 Caraway.
 Cassia and cinnamon.
 Cedrat.
 Camomile.
 Citronella or lemon-grass.
 Civet.
 Fennel.
 Jasmine, or jessamine.
 Juglandium.
 Juniper.
 Lavender.
 Lemon.
 Limes.
 Mace.
 Neroli, or orange-flower.
 Orange.
 Palm and coconut.
 Poppy.
 Rosemary, or anthoss.
 Sesame or sesamum-seed, or bene.
 Thyme or organum, red or white; valerian.
 Pepper, unground, of all kinds.
 Pimento, unground.
 Saffron and safflower, and extract of, and saffron
 cake.
 Selep, or saloup.
 Storax, or styrax.
 Turmeric.
 Turpentine, Venice.
 Valonia.
 Vegetable and mineral wax.
 Wood-ashes, and lye of, and beet-root ashes.
 Ashes used for medicinal, chemical, or manufactur-
 ing purposes, not specially enumerated or provided
 for in this act.
 Alizarine, natural or artificial.
 Agates, unmanufactured.
 Apatite.
 Asbestos, unmanufactured.
 Arsenic.
 Antimony-ore, crude sulphide of.
 Arsenic sulphide of, or orpiment.
 Arseniate of aniline.
 Baryta, carbonate or witherite.
 Bauxite.
 Aniline salts or black salts and black tars.
 Bromine.
 Cadmium.
 Calamine.
 Cerium.
 Cobalt, as metallic arsenic.
 Chalk and cliff stone, unmanufactured.
 Feldspar.
 Cryolite or kryolith.
 Iridium.
 Kieserite.
 Kyanite or cyanite, and kainite.
 Lime, citrate of.
 Lime, chloride of, or bleaching-powder.
 Magnesium.
 Magnesite, or native mineral carbonate of magnesia.
 Manganese, oxide and ore of.
 Mineral waters, all not artificial.
 Osmium.
 Palladium.
 Paraffine.
 Phosphates, crude or native, for fertilizing pur-
 poses.
 Potash, muriate of.
 Plaster-of-Paris or sulphate of lime, unground.
 Quinia, sulphate of, salts of, and cinchonidia.
 Soda, nitrate of, or cubic nitrate.
 Strontia, oxide of, and proto-oxide of strontian, and
 strontianite, or mineral carbonate of strontia.
 Sulphur, or brimstone, not specially enumerated or
 provided for in this act.
 Sulphur lac or precipitated.
 Tripoli.
 Uranium, oxide of, verdigris or subacetate of copper.
 Drugs, barks, beans, berries, balsams, buds, bulbs,
 and bulbous roots and excrecences, such as nut-
 galls, fruits, flowers, dried fibers; grains, gums and
 gum-resin; herbs, leaves, lichens, mosses, nuts,
 roots, and stems; spices, vegetables, seeds aromatic,
 and seeds of morbid growth; weeds, woods used ex-
 pressly for dyeing, and dried insects—any of the fore-
 going, of which are not edible and are in a crude
 state, and not advanced in value or condition by re-
 fining or grinding, or by other process of manufac-
 ture, and not specially enumerated or provided for in
 this act.
 Vaccine virus.
 Crude minerals, not advanced in value or condition
 by refining or grinding, or by other process of manu-
 facture, not specially enumerated or provided for in
 this act.
- SUNDRIES.
- Aluminium.
 Amber beads and gum.
 Animals, brought into the United States tempora-
 rily, and for a period not exceeding six months, for
 the purpose of exhibition or competition for prizes
 offered by any agricultural or racing association; but
 a bond shall be first given in accordance with the
 regulations.
 Animals specially imported for breeding purposes,
 shall be admitted free upon proof thereof satisfactory
 to the Secretary of the Treasury, and under such

regulations as he may prescribe; and teams of animals, including their harness and tackle, and the vehicles or wagons actually owned by persons emigrating from foreign countries to the United States with their families, and in actual use for the purpose of such emigration, shall also be admitted free of duty, under such regulations as the Secretary of the Treasury may prescribe.

Asphaltum and bitumen, crude.

Arrowroot.

Articles imported for the use of the United States, provided that the price of the same did not include the duty.

Bamboo reeds, no further manufactured than cut into suitable lengths for walking-sticks or canes, or for stives for umbrellas, parasols, or sunshades.

Bamboo, unmanufactured.

Barrels of American manufacture, exported filled with domestic petroleum, and returned empty, under such regulations as the Secretary of the Treasury may prescribe, and without requiring the filing of a declaration at time of export of intent to return the same empty.

Articles the growth, produce, and manufacture of the United States, when returned in the same condition as exported. Casks, barrels, carboys, bags, and other vessels of American manufacture, exported filled with American products, or exported empty and returned filled with foreign products, including shooks, when returned as barrels or boxes; but proof of the identity of such articles shall be made under regulations to be prescribed by the Secretary of the Treasury; and if any of such articles are subject to internal tax at the time of exportation, such tax shall be proved to have been paid before exportation and not refunded.

Bed-feathers and downs.

Bells, broken, and bell-metal broken and fit only to be remanufactured.

Birds, stuffed.

Birds, and land and water fowls.

Bismuth.

Bladders, crude, and all integuments of animals not specially enumerated or provided for in this act.

Bologna sausages.

Bolting-cloths.

Books, engravings, bound or unbound, etchings, maps, and charts, which shall have been printed and manufactured more than twenty years at the date of importation.

Books, maps, and charts imported by authority or for use of the United States or for the use of the Library of Congress; but the duty shall not have been included in the contract of price paid.

Books, maps, and charts specially imported, not more than two copies in any one invoice, in good faith, for the use of any society incorporated or established for philosophical, literary, or religious purposes, or for the encouragement of the fine arts, or for the use or by order of any college, academy, school, or seminary of learning in the United States.

Books, professional, of persons arriving in the United States.

Books, household effects, or libraries, or parts of libraries, in use, of persons or families from foreign countries, if used abroad by them not less than one year, and not intended for any other person or persons, nor for sale.

Breccia, in blocks or slabs.

Brims.

Brazil pebbles for spectacles, and pebbles for spectacles, rough.

Bullion, gold and silver.

Burgundy pitch.

Burr-stone, in blocks, rough or unmanufactured, and not bound up in millstones.

Cabinets of coins, medals, and all other collections of antiquities.

Castor or castoreum.

Catgut strings, or gut-cord, for musical instruments.

Catgut or whip-gut, unmanufactured.

Coal, anthracite.

Coal-stores of American vessels, but none shall be unloaded.

Cobalt, ore of.

Cocoa, or cacao, crude, and fiber, leaves, and shells.

Coffee.

Coins, gold, silver, and copper.

Coir and coir yarn.

Copper, old, taken from the bottom of American vessels compelled by marine disaster to repair in foreign ports.

Copper, when imported for the United States Mint.

Coral, marine, unmanufactured.

Cork-wood, or cork-bark, unmanufactured.

Cotton.

Curling-stones, or quoits.

Cuttle-fish bone.

Diamonds, rough or uncut, including glaziers' diamonds.

Diamond dust or bort.

Dyeing or tanning articles, in a crude state, used in dyeing or tanning, not specially enumerated or provided for in this act.

Eggs.

Esparto or Spanish grass, and other grasses, and pulp of, for the manufacture of paper.

Emery-ore.

Fans, common palm-leaf.

Farina.

Fashion-plates, engraved on steel or on wood, colored or plain.

Felt, adhesive, for sheathing vessels.

Fibrin, in all forms.

Fire-wood.

Fish, fresh, for immediate consumption.

Fish, for bait.

Flint, flints, and ground flint-stones.

Fossils.

Fruit-plants, tropical and semi-tropical, for the purpose of propagation or cultivation.

Fruits, green, ripe, or dried, not specially enumerated or provided for in this act.

Furs, undressed.

Fur-skins of all kinds, not dressed in any manner.

Glass, broken pieces, and old glass which can not be cut for use, and fit only to be remanufactured.

Glass-plate, or disks unwrought, for use in the manufacture of optical instruments.

Goat-skins, raw.

Gold-beaters' molds, and gold-beaters' skins.

Gold-size.

Grease, for use as soap-stock only, not specially enumerated or provided for.

Gunny-bags, and gunny-cloth, old or refuse, fit only for remanufacturing.

Gut and worm-gut, manufactured or unmanufactured.

Guts, salted.

Gutta-percha, crude.

Hair, horse or cattle, and hair of all kinds, cleaned or uncleaned, drawn or undrawn, but unmanufactured, not specially enumerated or provided for in this act; of hogs, curled for beds and mattresses, and not fit for bristles.

Hide-rope.

Hides, raw or uncured, whether dry, salted, or pickled, and skins, except sheep-skins with the wool on, Angora goat-skins, raw, without the wool, unmanufactured, asses' skins, raw or unmanufactured.

Hones and whetstones.

Hop-roots, for cultivation.

Hop-poles.

Ice.

India-rubber, crude, and milk of.

India malacca joints, not further manufactured than cut into suitable lengths for the manufactures into which they are intended to be converted.

Ivory, and vegetable ivory, unmanufactured.

Jet, unmanufactured.

Joss-stick, or joss-light.
 Junk, old.
 Lava, unmanufactured.
 Life-boats and life-saving apparatus, specially imported by societies incorporated or established to encourage the saving of human life.
 Lithographic stones, not engraved.
 Loadstones.
 Logs, and round, unmanufactured timber, not specially enumerated or provided for in this act, and ship-timber, and ship-planking.
 Macaroni and vermicelli.
 Magnets.
 Manuscripts.
 Marrow, crude.
 Marsh-mallows.
 Medals of gold, silver, or copper.
 Meerschaum, crude or raw.
 Mica and mica waste.
 Models of inventions and other improvements in the arts; but no article or articles shall be deemed a model or improvements which can be fitted for use.
 Moss, sea-weeds, and all other vegetable substances used for beds and mattresses.
 Newspapers and periodicals.
 Nuts, cocoa, and Brazil or cream.
 Oakum.
 Oil-cake.
 Oil, spermaceti, whale, and other fish oils of American fisheries, and all other articles the produce of such fisheries.
 Olives, green or prepared.
 Orange and lemon peel, not preserved, candied, or otherwise prepared.
 Ores, of gold and silver.
 Palm-nuts and palm-nut kernels.
 Paper stock, crude, of every description, including all grasses, fibers, rags of all kinds, other than wool, waste, shavings, clippings, old paper, rope-ends, waste rope, waste bagging, gunny-bags, gunny-cloth, old or refuse, to be used in making, and fit only to be converted into paper, and unfit for any other manufacture, and cotton waste, whether for paper stock or other purposes.
 Parchment.
 Pearl, mother of.
 Personal and household effects, not merchandise, of citizens of the United States dying abroad.
 Pewter and Britannia metal, old, and fit only to be remanufactured.
 Philosophical and scientific apparatus, instruments, and preparations, statuary, casts of marble, bronze, alabaster, or plaster-of-Paris, paintings, drawings, and etchings, specially imported in good faith for the use of any society or institution incorporated or established for religious, philosophical, educational, scientific, or literary purposes, or encouragement of the fine arts, and not intended for sale.
 Plants, trees, shrubs, and vines of all kinds not otherwise provided for, and seeds of all kinds, except medicinal seeds not specially enumerated or provided for in this act.
 Plants, trees, shrubs, roots, seed-cane, and seeds imported by the Department of Agriculture or the United States Botanical Garden.
 Platina, unmanufactured.
 Platinum, unmanufactured, and vases, retorts, and other apparatus, vessels, and parts thereof, for chemical uses.
 Plumbago.
 Polishing-stones.
 Pulu.
 Pumice and pumice-stone.
 Quills, prepared or unprepared.
 Railroad-ties, of wood.
 Rattans and reeds, unmanufactured.
 Regalia and gems, statues, statuary, and specimens of sculpture, where specially imported in good faith for the use of any society incorporated or established for philosophical, literary, or religious purposes, or

for the encouragement of the fine arts, or for the use or by order of any college, academy, school, seminary of learning, or public library in the United States.

Root-flour.
 Rotten-stone.
 Sago, sago crude, and sago-flour.
 Sauerkraut.
 Sausage-skins.
 Sea-weed, not otherwise provided for.
 Seed of the sugar-beet.
 Shark-skins.
 Shells of every description, not manufactured.
 Shingle-bolts and stove-bolts, provided that heading-bolts shall be held and construed to be included under the term stove-bolts.
 Handle-bolts.
 Shrimps, or other shell-fish.
 Silk, raw, or as reeled from the cocoon, but not doubled, twisted, or advanced in manufacture in any way.
 Silk cocoons and silk waste.
 Silk-worms' eggs.
 Skeletons, and other preparations of anatomy.
 Skins, dried, salted, or pickled.
 Snails.
 Soap-stocks.
 Sodium.
 Sparterre, for making or ornamenting hats.
 Specimens of natural history, botany, and mineralogy, when imported for cabinets, or as objects of taste or science, and not for sale.
 Spunk.
 Spurs and stilt, used in the manufacture of earthen, stone, or crockery ware.
 Straw, unmanufactured.
 Sugar of milk.
 Sweepings of silver and gold.
 Tamarinds.
 Tapioca, cassava, or cassada.
 Tea.
 Tea-plants.
 Teasels.
 Teeth, unmanufactured.
 Terra alba, aluminous.
 Terra japonica.
 Tin-ore, bars, blocks, or pigs, grain or granulated.
 Tonquin, Tonqua, or Tonka beans.
 Tortoise and other shells, unmanufactured.
 Turbles.
 Types, old, and fit only to be remanufactured.
 Umbrella-sticks, crude, to wit, all partridge, hair-wood, pimento, orange, myrtle, and all other sticks and canes in the rough, or no further manufactured than cut into lengths suitable for umbrella, parasol, or sunshade sticks or walking-canes.
 Vellum.
 Wafers, unmedicated.
 Wearing apparel, in actual use, and other personal effects (not merchandise), professional books, implements, instruments, and tools of trade, occupation, or employment of persons arriving in the United States. But this exemption shall not be construed to include machinery or other articles imported for use in any manufacturing establishment, or for sale.
 Whalebone, unmanufactured.
 Woods, poplar, or other woods, for the manufacture of paper.
 Woods, namely, cedar, lignum-vits, lancewood, ebony, box, granadilla, mahogany, rose-wood, satin-wood, and all cabinet-woods, unmanufactured.
 Works of art, painting, statuary, fountains, and other works of art, the production of American artists. But the fact of such production must be verified by the certificate of a consul or minister of the United States indorsed upon the written declaration of the artist; paintings, statuary, fountains, and other works of art, imported expressly for presentation to national institutions, or to any State, or to any municipal corporation, or religious corporation or society.

Yams.
Zaffer.

Sec. 2504. Whenever any vessel laden with merchandise in whole or in part subject to duty has been sunk in any river, harbor, bay, or waters subject to the jurisdiction of the United States, and within its limits, for the period of two years, and is abandoned by the owner thereof, any person who may raise such vessel shall be permitted to bring any merchandise recovered therefrom into the port nearest to the place where such vessel was so raised, free from the payment of any duty thereupon, and without being obliged to enter the same at the custom-house; but under such regulations as the Secretary of the Treasury may prescribe.

Sec. 2505. The produce of the forests of the State of Maine upon the Saint John river and its tributaries, owned by American citizens, and sawed or hewed in the province of New Brunswick by American citizens, the same being unmanufactured in whole or in part, which is now admitted into the ports of the United States free of duty, shall continue to be so admitted under such regulations as the Secretary of the Treasury shall, from time to time, prescribe.

Sec. 2506. The produce of the forests of the State of Maine upon the Saint Croix river and its tributaries, owned by American citizens, and sawed in the province of New Brunswick by American citizens, the same being unmanufactured in whole or in part, and having paid the same taxes as other American lumber on that river, shall be admitted into the ports of the United States free of duty, under such regulations as the Secretary of the Treasury shall, from time to time, prescribe.

Sec. 2507. Machinery for repair may be imported into the United States without payment of duty, under bond, to be given in double the appraised value thereof, to be withdrawn and exported after said machinery shall have been repaired; and the Secretary of the Treasury is authorized and directed to prescribe such rules and regulations as may be necessary to protect the revenue against fraud, and secure the identity and character of all such importations when again withdrawn and exported, restricting and limiting the export and withdrawal to the same port of entry where imported, and also limiting all bonds to a period of time of not more than six months from the date of the importation.

Sec. 2508. All paintings, statuary, and photographic pictures imported into the United States for exhibition by any association duly authorized under the laws of the United States, or of any State, for the promotion and encouragement of science, art, or industry, and not intended for sale, shall be admitted free of duty, under such regulations as the Secretary of the Treasury shall prescribe. But bonds shall be given for the payment to the United States of such duties as may be imposed by law upon any and all of such articles as shall not be re-exported within six months after such importation.

Sec. 2509. All works of art, collections in illustration of the progress of the arts, science, or manufactures, photographs, works in terra-cotta, Parian, pottery, or porcelain, and artistic copies of antiquities in metal or other material, hereafter imported in good faith for permanent exhibition at a fixed place by any society or institution established for the encouragement of the arts or science, and not intended for sale, nor for any other purpose than is hereinbefore expressed, and all such articles imported as aforesaid, now in bond, and all like articles imported in good faith by any society or association for the purpose of erecting a public monument, and not for sale, shall be admitted free of duty, under such regulations as the Secretary of the Treasury may prescribe: *Provided*, That the parties importing articles as aforesaid shall be required to give bonds, with sufficient sureties, under such rules and regulations as the Secretary of the Treasury may prescribe, for the payment of lawful duties which may accrue should any of the articles

aforesaid be sold, transferred, or used contrary to the provisions and intent of this act.

Sec. 2510. All lumber, timber, hemp, manila, wire rope, and iron and steel rods, bars, spikes, nails, and bolts, and copper and composition metal which may be necessary for the construction and equipment of vessels built in the United States for foreign account and ownership or for the purpose of being employed in the foreign trade, including the trade between the Atlantic and Pacific ports of the United States, after the passage of this act, may be imported in bond, under such regulations as the Secretary of the Treasury may prescribe; and upon proof that such materials have been used for such purpose, no duties shall be paid thereon. But vessels receiving the benefit of this section shall not be allowed to engage in the coastwise trade of the United States more than two months in any one year, except upon the payment to the United States of the duties on which a rebate is herein allowed: *Provided*, That vessels built in the United States for foreign account and ownership shall not be allowed to engage in the coastwise trade of the United States.

Sec. 2511. All articles of foreign production needed for the repair of American vessels engaged exclusively in foreign trade may be withdrawn from bonded warehouses free of duty, under such regulations as the Secretary of the Treasury may prescribe.

Sec. 2512. That no duty shall be levied or collected on the importation of peltries brought into the Territories of the United States by Indians, nor on the proper goods and effects, of whatever nature, of Indians passing or re-passing the boundary-line aforesaid, unless the same be goods in bales or other large packages unusual among Indians, which shall not be considered as goods belonging to Indians, nor be entitled to the exemption from duty aforesaid.

Sec. 2513. There shall be levied, collected, and paid on the importation of all raw or unmanufactured articles, not herein enumerated or provided for, a duty of ten per centum ad valorem; and all articles manufactured, in whole or in part, not herein enumerated or provided for, a duty of twenty per centum ad valorem.

Sec. 7. That sections twenty-nine hundred and seven and twenty-nine hundred and eight of the Revised Statutes of the United States and section fourteen of the act entitled "An act to amend the customs revenue laws, and to repeal moieties," approved June twenty-second, eighteen hundred and seventy-four, be and the same are hereby repealed, and hereafter none of the charges imposed by said sections or any other provisions of existing law shall be estimated in ascertaining the value of goods to be imported, nor shall the value of the usual and necessary sacks, crates, boxes, or coverings of any kind be estimated as part of their value in determining the amount of duties for which they are liable: *Provided*, That if any packages, sacks, crates, boxes, or coverings of any kind shall be of any material or form designed to evade duties thereon, or designed for use otherwise than in the bona fide transportation of goods to the United States, the same shall be subject to a duty of one hundred per centum ad valorem upon the actual value of the same.

Sec. 8. That section twenty-eight hundred and forty-one of the Revised Statutes of the United States is hereby amended and shall on and after the first day of July, eighteen hundred and eighty-three, be as follows:

Sec. 2841. Whenever merchandise imported into the United States is entered by invoice, one of the following oaths, according to the nature of the case, shall be administered by the collector of the port, at the time of entry, to the owner, importer, consignee, or agent: *Provided*, That if any of the invoices or bills of lading of any merchandise imported in said vessel, which should otherwise be embraced in said entry, have not been received at the date of the entry,

the affidavit may state the fact, and thereupon such merchandise of which the invoices or bills of lading are not produced shall not be included in such entry, but may be entered subsequently.

OATH OF CONSIGNEE, IMPORTER, OR AGENT.

I, _____, do solemnly and truly swear (or affirm) that the invoice and bill of lading now presented by me to the collector of _____ are the true and only invoice and bill of lading by me received, of goods, wares, and merchandise imported in the _____, whereof _____ is master, from _____, for account of any person whomsoever for whom I am authorized to enter the same; that the said invoice and bill of lading are in the state in which they were actually received by me, and that I do not know nor believe in the existence of any other invoice or bill of lading of the said goods, wares, and merchandise; that the entry now delivered to the collector contains a just and true account of the said goods, wares, and merchandise, according to the said invoice and bill of lading; that nothing has been, on my part, nor to my knowledge, on the part of any other person, concealed or suppressed, whereby the United States may be defrauded of any part of the duty lawfully due on the said goods, wares, and merchandise; that the said invoice and the declaration therein are in all respects true, and were made by the person by whom the same purports to have been made, and that if, at any time hereafter, I discover any error in the said invoice, or in the account now rendered of the said goods, wares, and merchandise, or receive any other invoice of the same, I will immediately make the same known to the collector of this district. And I do further solemnly and truly swear (or affirm) that, to the best of my knowledge and belief (insert the name and residence of the owner or owners), is (or are) the owner (or owners) of the goods, wares, and merchandise mentioned in the annexed entry; that the invoice now produced by me exhibits the actual cost (if purchased) or fair market value (if otherwise obtained) at the time or times and place or places when or where procured (as the case may be), of the said goods, wares, and merchandise, including all cost for finishing said goods, wares, and merchandise to their present condition, and no other or different discount, bounty, or drawback but such as has been actually allowed on the same.

OATH OF OWNER IN CASES WHERE MERCHANDISE HAS BEEN ACTUALLY PURCHASED.

I, _____, do solemnly and truly swear (or affirm) that the entry now delivered by me to the collector of _____ contains a just and true account of the goods, wares, and merchandise imported by or consigned to me, in the _____, whereof _____ is master, from _____; that the invoice which I now produce contains a just and faithful account of the actual cost of the said goods, wares, and merchandise, including all cost of finishing said goods, wares, and merchandise to their present condition, and no other discount, drawback, or bounty but such as has been actually allowed on the same; that I do not know or believe in the existence of any invoice or bill of lading other than those now produced by me, and that they are in the state in which I actually received them. And I further solemnly and truly swear (or affirm) that I have not in the said entry or invoice concealed or suppressed anything whereby the United States may be defrauded of any part of the duty lawfully due on the said goods, wares, and merchandise; that the said invoice and the declaration thereon are in all respects true, and were made by the person by whom the same purports to have been made; and that if at any time hereafter I discover any error in the said invoice or in the account now produced of the said goods, wares, and merchandise, or receive any other invoice of the same, I will immediately make the same known to the collector of this district.

OATH OF MANUFACTURER OR OWNER IN CASES WHERE MERCHANDISE HAS NOT BEEN ACTUALLY PURCHASED.

I, _____, do solemnly and truly swear (or affirm) that the entry now delivered by me to the collector of _____ contains a just and true account of goods, wares, and merchandise imported by or consigned to me in the _____, whereof _____ is master, from _____; that the said goods, wares, and merchandise were not actually bought by me, or by my agent, in the ordinary mode of bargain and sale, but that, nevertheless, the invoice which I now produce contains a just and faithful valuation of the same, at their fair market value, at the time or times and place or places when and where procured for my account (or for account of myself or partners); that the said invoice contains also a just and faithful account of all the cost for finishing said goods, wares, and merchandise to their present condition, and no other discount, drawback, or bounty but such as has been actually allowed on the said goods, wares, and merchandise; that the said invoice and the declaration thereon are in all respects true, and were made by the person by whom the same purports to have been made; that I do not know nor believe in the existence of any invoice or bill of lading other than those now produced by me, and that they are in the state in which I actually received them. And I do further solemnly and truly swear (or affirm) that I have not in the said entry or invoice concealed or suppressed anything whereby the United States may be defrauded of any part of the duty lawfully due on the said goods, wares, and merchandise, and that if at any time hereafter I discover any error in the said invoice, or in the account now produced of the said goods, wares, and merchandise, or receive any other invoice of the same, I will immediately make the same known to the collector of this district.

Sec. 9. If upon the appraisal of imported goods, wares, and merchandise, it shall appear that the true and actual market value and wholesale price thereof, as provided by law, can not be ascertained to the satisfaction of the appraiser, whether because such goods, wares, and merchandise be consigned for sale by the manufacturer abroad to his agent in the United States, or for any other reason, it shall then be lawful to appraise the same by ascertaining the cost or value of the materials composing such merchandise, at the time and place of manufacture, together with the expense of manufacturing, preparing, and putting up such merchandise for shipment, and in no case shall the value of such goods, wares, and merchandise be appraised at less than the total cost or value thus ascertained.

Sec. 10. That all imported goods, wares, and merchandise which may be in the public stores or bonded warehouses on the day and year when this act shall go into effect, except as otherwise provided in this act, shall be subjected to no other duty upon the entry thereof for consumption than if the same were imported respectively after that day; and all goods, wares, and merchandise remaining in bonded warehouses on the day and year this act shall take effect, and upon which the duties shall have been paid, shall be entitled to a refund of the difference between the amount of duties paid and the amount of duties said goods, wares, and merchandise would be subject to if the same were imported respectively after that date.

Sec. 11. Nothing in this act shall in any way change or impair the force or effect of any treaty between the United States and any other government, or any laws passed in pursuance of or for the execution of any such treaty, so long as such treaty shall remain in force in respect of the subjects embraced in this act; but whenever any such treaty, so far as the same respects said subjects, shall expire or be otherwise terminated, the provisions of this act shall be in force in all respects in the same manner and to the same extent as if no such treaty had existed at the time of the passage hereof.

Sec. 12. That in respect of all articles mentioned

in Schedule E of section six of this act, this act shall take effect on and after the first day of June, anno Domini eighteen hundred and eighty-three.

Sec. 18. That the repeal of existing laws, or modifications thereof embraced in this act shall not affect any act done, or any right accruing or accrued, or any suit or proceeding had or commenced in any civil cause, before the said repeal or modifications; but all rights and liabilities under said laws shall continue and may be enforced in the same manner as if said repeal or modifications had not been made; nor shall said repeal or modifications in any manner affect the right to any office, or change the term or tenure thereof. Any offenses committed, and all penalties or forfeitures or liabilities incurred under any statute embraced in or changed, modified, or repealed by this act may be prosecuted and punished in the same manner and with the same effect as if this act had not been passed. All acts of limitation, whether applicable to civil causes and proceedings or to the prosecution of offenses, or for the recovery of penalties or forfeitures embraced in or modified, changed, or repealed by this act, shall not be affected thereby; and all suits, proceedings, or prosecutions, whether civil or criminal, for causes arising or acts done or committed prior to the passage of this act, may be commenced and prosecuted within the same time and with the same effect as if this act had not been passed.

Amend the title so as to read, "An act to reduce internal-revenue taxation, and for other purposes."

The discussion of this measure in both Houses was so extended that any abstract of it would be out of the question. The debate on the adoption of the conference committee's report was brief, and mainly confined to the Democrats. The exceptions taken to the report, as deviating from the policy of the Senate bill, were set forth by Mr. Beck, of Kentucky, whose argument was as follows:

"I will speak of iron-ore first, because it illustrates more prominently and plainly than anything else what I desire to prove as to the outrageous character of this report. When the Senate of the United States—I will begin with our own action—had this question under discussion, many of the most intelligent men of the country, notably Hon. Abram S. Hewitt, laid facts before the country and before Congress to show that it was indispensable to the great iron industries of this country, as imported iron-ore had many qualities that iron-ore found in this country does not possess, that it should be imported free of duty, as when so imported it is used for the purpose of mixing with our own native ore, the foreign ore being low in phosphorus and there being a great deal of phosphorus in our own. He proved to my satisfaction that it would extend and cheapen the manufacture of our iron products and increase the uses to which our native ores could be applied.

"Earnest efforts were made on the part of some Senators, notably the Senator from Virginia (Mr. Mahone), to increase the duty on ore above 50 cents, which the commission said was the true rate, which the Senate committee said was the true rate, which the Senate as in Committee of the Whole determined was the true rate, and voted down upon the yeas and nays by overwhelming majorities every effort to increase it. The

House of Representatives, with Mr. Kelley at its head, I suppose I may now speak of the action of the House, as their acts are freely discussed, and I suppose their action is under review, said 50 cents per ton was the true rate of taxation on iron-ore. There was no disagreement between the House of Representatives and the Senate as to iron-ore.

"No committee of conference, dealing justly with both Houses and representing the expressed will of both Houses of Congress, could decently assume, when the two Houses had disagreed or had agreed, to change the rate of taxation upon which they had agreed. Yet this conference committee so called, acting, as I think, in defiance of the order of the Senate and in plain violation of their known duty, increased the duty on iron-ore, that both Houses had agreed should not be taxed more than 50 cents a ton, to 75 cents a ton, or 50 per cent. increase on the tax agreed on; and what is the effect of that usurpation of unwarranted authority? One case illustrates the whole—577,118 tons of iron-ore were imported last year; by adding 25 cents a ton to the cost of it the conference have added to the tax on that raw material \$144,279.50, assuming that the same quantity will be imported.

"Why was this done? By what authority? Obeying whose orders? What disagreeing vote did they adjust? The House had voted 50 cents; the Senate had voted 50 cents; they had agreed. The conferees arbitrarily overthrew what both Houses had agreed upon, and added a tax upon the importations of this raw material of \$144,279.50, and we are to be told that we must hurry this report through because of the late hour of the session, and allow that outrage to be perpetrated without question, and without being even told by the chairman of the committee why it was done; indeed, he carefully concealed the fact, merely saying that there was no material increase of taxation in any of the changes they had made, when there is 50 per cent. increase of duty upon the leading article out of which the iron of this country is made, and that was done by him and his associates in defiance of the deliberate action of the House and of the still more deliberate action of the Senate, all of which was well known to the conferees.

"An effort was next made to make the tax a dollar a ton. That was voted down; 85 cents was tried; 75 cents was tried; 60 cents was tried. At a dollar, if I mistake not, the vote was 11 in favor to 87 against it. Then the motion was made to make it 75 cents, and 15 voted in the affirmative and 84 in the negative upon a call of the yeas and nays. Sixty cents was tried, and the Senate persistently refused to increase it above 50 cents, and the House upon a vote refused to increase it above 50 cents a ton. The proposition to increase the tax was tried again on the 16th day of February in the Senate, on the motion of the Senator from Michigan (Mr. Conger); he

sought to make the duty 85 cents. The propriety of the increase was reargued and every effort was made upon a call of the yeas and nays to tax iron-ore higher than 50 cents a ton. It was again voted down by an overwhelming majority.

"In view of all these undoubted facts I ask the Senate, and I intend to appeal to the country even from the Senate, what right had that body of men who were sitting in secret council, authorized only to act upon disagreeing votes between the two Houses and to sustain the action of the Senate by all honorable means, to consider the tax on iron-ore, on which the House and Senate had agreed, and raise the duty on it 50 per cent., and then come here without even deigning to state the facts and tell us that we must adopt the report they have made, right or wrong—*fas et nefas*—or we are obstructors of public business?

"I aver, and the silence of the four or the five or whatever the number who agreed to this report gives consent to the truth of my statement, that they have imposed an increased tax of 50 per cent. on all the iron-ore that comes into the country beyond what either the House or the Senate had imposed, and when the House and Senate were agreed.

"If these admitted facts do not condemn this whole report and stamp it as a thing absolutely unfit for the Senate to indorse, I do not think any argument of mine will. There is not a Senate conferee who will venture to rise in his place and either justify it or excuse it. It stands confessed as a plain violation of their known duty.

"Passing from that, though one illustrates all, look at the action of the conference committee relative to glassware, one of the first important things touched in the report. Let me examine their action in that regard.

"This is the language of the present law :

"Earthen, stone, or crockery ware, white, glazed, edged, printed, painted, dipped, or cream-colored, not otherwise provided for, 40 per cent.

"That, of course, relates to earthen, stone, and crockery ware. The plainest character of designs on paper can be painted and pasted on plain crockery, and when placed in the furnace the paper is burned out and the paint or print remains. That is the whole process; there is no skill or intellect involved; it is done by the plainest, simplest process; the designs are painted by the hundred or thousand on pieces of paper and burned in; the paper, as I said, burns off and leaves the paint or print. Yet the conference committee, without any reason in the world that I can see, have taken that class of cheap goods out of the schedule where the Senate placed them at 50 per cent., which is 25 per cent. increase on the duty under the present law, because it was said we had given importers the benefit of a reduction of taxes, by taking the duty off the packages, which on the cheapest classes of goods amount to, say, 10 per cent. Our conferees have taken

these goods from the schedule of 50 per cent. and placed them in the schedule of 60 per cent., an increase of 50 per cent. on the present rate, along with china, porcelain, parian, and bisque ware, and the other decorations that ornament the mantel-pieces of the rich.

"I have never heard the revenues of the Government spoken of as being worthy of consideration by any gentleman on the other side during this whole discussion. I have never heard the rights of the consumers of this country spoken of as being worthy of consideration while extravagant taxes were being imposed. The whole question has been, How much can the iron-men afford to take off; how much will the cotton schedule, how much will the woolen schedule bear reduction, or shall they be increased above present rates? And when Senators examine into the pretended reductions, they will prove to be increases in nine cases out of ten, all assertions to the contrary notwithstanding. The swarms of lobbyists who are now here and have been for weeks, are all begging for more bounty, more protection, or rather more taxation on the people to enrich themselves. These are the plates [exhibiting] that the conference committee have put up to a 60 per cent. tax after the Senate had peremptorily refused to consider all the propositions urged when we had these matters under consideration.

"Yet the chairman tells us that they are making this increase of taxation in the interest of economy, carefully refraining from stating the facts, and frowning upon any attempt to expose their acts as improper and factious opposition. Of that plain crockery-ware, as you will observe by looking over the schedule that we have before us, furnished by the Treasury Department, there were goods imported last year to the value of \$4,400,000, at 40 per cent. The duty which the people paid on them was \$1,775,294. By the provision now proposed on the same amount of importation at 60 per cent. they will have to pay \$2,662,941, or an increase of \$887,648 over the present high war tariff that everybody says ought to be reduced, and they will have to pay \$443,824 by this change of rate on the same importations more than they would have to pay under the bill as it passed the Senate at 50 per cent. That is called a slight modification, a very slight increase, so insignificant that the chairman seemed to think that the report should be concurred in without a word. He did not even think that it was worth while to tell us what he and his co-conferees had done.

"Turn to another change in the glass schedule and see what the autocrats of the conference have done. We struggled over the question of taxing bottles time and again, first in Committee of the Whole, and next in the Senate; that question was brought up in season and out of season. We settled it at 80 per cent., and provided that bottles in which apollinaris and other natural mineral waters came

should be free. No man ventured to make an argument worth calling such against that provision. It was admitted that when a bottle once reaches this country, whether it has apollinaris water in it or anything else, it competes when it reaches here with the domestic manufacture of bottles precisely to the same extent whether it comes free or pays a tax. We all agreed that if the people wanted these waters they had a right to have them.

"We thought there were some things the people ought to have without being taxed to death, and that the water of the springs of the world that they might prefer as conducive to their health or their pleasure ought not to be taxed; all agreed that was right. Yet this conference committee, this secret conclave—they were in no proper sense conferees, yet I shall speak of them as such—not only imposed a heavy tax upon all the bottles in which apollinaris and other waters come, as you will see by turning over to the free-list, but they increased the tax upon all the other bottles used in this country from the present tax of 80 per cent. to about 100 per cent., although we had voted down the proposition to do so, as I have stated, every time it was offered, both in committee and in the Senate, until every advocate of the increased tax had given it up. Yet these gentlemen secretly and wrongfully bring it back with the tax of 100 per cent. on these things. I regard their action as an outrage, in flagrant disregard of the known will of Congress.

"The Milwaukee brewer who bottles 100,000 barrels annually, consumes almost as many bottles as are imported into the United States in a year. The Senate of the United States refused to increase the tax above 80 per cent. But our would-be masters, disregarding our will, have increased it to a cent a pound, or 100 per cent. upon all that class of bottles in the interest of the bottle-makers, adding to the tax paid by a single brewer who bottles 100,000 barrels of beer annually over \$200,000, in order to put the money into the pockets of some of their friends. They have, I repeat, in plain violation of the orders of the Senate, placed the bottles in which apollinaris, vichy, and other natural waters are imported, on the taxable list, and whether they will impose a charge on them of one cent a pound or whether they will be taxed at 80 per cent. ad valorem, will depend upon a careful construction of the conflicting clauses contained in the conference report, which, if Senators will read, they will see were inserted, if not for the purpose, certainly with the effect of deceiving and of requiring the Treasury Department to give the manufacturer here the benefit of the doubt and thus force the officials to decide that they shall pay 100 per cent.; because after the long and apparently successful struggle that we made not to allow the highest duty to be imposed in doubtful cases, the conferees provide—and I believe that was the point at which the Sena-

tor from Delaware and myself left the conference, it being the first important change in our tariff amendment, as there was no question in regard to the internal-revenue taxes which both Houses had acted on, and as to which no difference of opinion was developed, I suppose the relief given there is relied on to carry through on the single vote to which we are now confined all the atrocities of the tariff amendments:

"If two or more rates of duty should be applicable to any imported article, it shall be classified for duty under the highest of such rates.

"They have one rate of 80 per cent. for bottles filled; that is, they shall pay 80 per cent. ad valorem in addition to the duties on the contents. Yet the conference committee insert another amendment in these words:

"All glass bottles and decanters, and other like vessels of glass, shall, if filled, pay the same rates of duty, in addition to any duty chargeable on the contents, as if not filled, except as in this act otherwise specially provided for.

"That is one cent a pound, or 100 per cent. ad valorem on common bottles. One of these conflicting provisions in regard to bottles makes them pay 80 per cent. if filled, and another provision makes them pay the same duty whether filled or not. By the general clause as to the highest rate in doubtful cases they will be required to pay 100 per cent., in my opinion. If that is not a trick I do not know what to call it. I do not intend to charge any Senator with trickery, but the provision they have made that whenever there is a doubt, or it can be construed that there are two or more rates applicable to the article it shall pay the highest, these two conflicting provisions will give the officials a chance to tax it at the highest rate.

"I will speak next of pig-iron. The Senate of the United States had a long and earnest discussion as to the propriety of a general reduction of tax in the iron schedule, as all agreed that reasonably cheap pig-iron was indispensable to enable the people to obtain cheap finished products. We agreed upon \$6 per ton as being the proper rate to charge on pig-iron, with a like rate on scrap-iron, both steel and cast. It was debated long and ably in all its aspects. I have the debate before me. I had expected to read part of it, but I find that I can not. We agreed upon a duty of \$6 a ton. After a while, when we had gone through the bill in Committee of the Whole, the Senator from Ohio threatened to vote against the bill, and to defeat all our efforts at giving the people any relief in internal or tariff taxation unless we increased the tax on pig-iron and upon such articles in the iron schedule as he demanded. I will read from his speech before I close. He read telegrams from Hon. Henry B. Payne, of Cleveland, and others, telling him to vote against the bill, and he said he would obey their orders unless we obeyed his.

"I repeat that the Senator from Ohio threatened the Senate with the defeat of the whole bill. After all sorts of efforts, and when he had drawn the party whip over the heads of his followers with an audacity I had never seen equaled in any public assembly, by threats and every other means that a great, bold parliamentary leader can assert over the men who look up to him, he finally succeeded in having \$6.50 imposed as the tax upon pig-iron.

"That was the last cent he could obtain by promises, flattery, or threats, but his resources were not exhausted. The conference committee met, and under the lead of the Senator from Ohio, I may safely assume, at his dictation, they have imposed a tax upon pig-iron of \$6.72 per ton and insist that we must accept it. What is the effect of that? Of scrap and pig iron 768,761 tons were imported last year. Seventy-two cents increase over the \$6 that the Senate had agreed upon until the Senator from Ohio drove his party up to an increase, would be \$549,905. Twenty-two cents per ton—being the difference between this report and \$6.50, the highest point to which the Senator could induce the Senate to advance after all the coercion he could impose upon his followers—22 cents per ton on 768,761 tons is \$169,027 additional tax that this conference committee has placed upon pig-iron; and we all know that we have to accept that report as a whole or reject it.

"What next? Take railway-bars. I want the conferees on the part of the Senate to tell the Senate why they have imposed the tax they have in the report they present for our acceptance. Let me show what they have done. This is another undoubted usurpation of power by the conference committee. Steel railway-bars were put by the Senate at seven tenths of one cent a pound when weighing more than twenty-five pounds to the yard. That is \$15.68 per ton. The House voted on that question also; if we are to look to the House, it imposed a tax of \$15 per ton on rails. The House voted for a tax of 68 cents a ton lower than the Senate on steel railway-bars, the House bill providing for a duty of \$15 and the Senate bill \$15.68 a ton. Bear these facts in mind.

"What did the conferees do? They have imposed a tax upon steel railway-bars of \$17 per ton. The Senate had imposed a tax of \$15.68, the House \$15. The conferees, purporting to meet for the purpose of reconciling the disagreeing votes between the two Houses, imposed a tax on that article of \$17 per ton, or \$2 more than the House had imposed upon it and \$1.32 more than the Senate had imposed upon it. I again ask any of them to rise now and tell the Senate by what authority they seek to impose a higher tax on this important article than either House imposed. I charge them with a gross violation of their power and a usurpation of authority not granted to them in doing so.

"The amount of importation of that class of steel rails during the last year was about 200,000 tons. The report of the conference as to the tax upon that article is an increase of \$400,000 on last year's imports over what the House had agreed to impose upon it, and of \$264,000 over what the Senate had imposed upon it; and yet under pretense of reconciling the disagreeing votes of the two Houses they imposed an additional tax upon the people of \$400,000 more than the House of Representatives had demanded and \$264,000 more than the Senate had said ought to be imposed. If that is not an outrage upon the rights of this people, if it is not a violation of the known duty of the committee, while pretending to reconcile the disagreeing or conflicting votes between the two Houses, by placing a tax higher than either House had suggested, then I do not understand what it is, and can hardly characterize it as I ought in parliamentary language.

"Again, the Senate agreed upon a duty on bar-iron not less than three quarters of an inch in diameter and square iron not more than three quarters of an inch square of \$20 per ton, and upon round iron less than three quarters of an inch square of \$22 per ton; the conferees have increased that tax from \$20 per ton in the one instance to \$22.40 per ton, and in the other from \$22 a ton to \$24.64 per ton; the original rates were fixed by the Senate with the aid and by the vote of the Senator from Ohio, one of the conferees. We had a right to suppose that he would adhere to his own votes, yet after so voting and advocating the lower rates, saying that his friend from Georgia (Mr. Brown) was right in imposing these rates, he now turns round in secret conference and imposes upon all the iron rolled, hammered, or otherwise advanced an additional tax of \$2.40 a ton upon one class and \$2.64 upon the other.

"Again, Mr. President, passing on to another clause, light steel rails, of which there is a very large importation, to wit, a class of rails used for street-railways, tramways, narrow-gauge roads, and inclined planes, in short all that class of rails generally used by the smaller and poorer corporations, by the municipal authorities, or by individuals, of which the importation last year was \$2,658,997 in value and the revenue \$1,414,910, the Senate of the United States imposed a duty of eight tenths of a cent per pound upon all that class of goods, or \$17.92 per ton. I have not had an opportunity of examining what the House did in that regard, if their bill is to be considered. It seems to be worthy of consideration, according to the chairman's view, whenever the conferees think they find some excuse for their conduct by referring to what the House has done, and claim that the House had no bill when they increase taxes beyond what either House imposed.

"Under the present law iron bars for inclined planes, as the official statement in my

hand shows, the rate is seven tenths of a cent a pound, or 58 per cent. ad valorem. The Tariff Commission proposed seven tenths of a cent a pound, and the Senate imposed a tax of eight tenths of a cent a pound. This so-called conference committee taxed them above what the Tariff Commission reported, above the present law, above the action of the Senate. They have divided the paragraph into two parts and placed nine tenths of a cent a pound upon a portion of them, increasing them from \$17.92 per ton to \$20.16, and upon the balance of them, where they are punched, to one cent a pound or \$22.40 per ton. Upon a portion of these goods they make an increase of \$2.24 a ton, and upon the balance there is an increase of \$4.60; and this, though the Senate proposition for taxation upon all this class of articles was higher than the present law and higher than the Tariff Commission report. In this miserable sham conference, after all we have done, on articles that were imported last year to the value of \$2,658,977, paying a revenue of \$1,414,910, they make an increase of \$2.24 a ton on half and of \$4.60 upon the other half, without any reason that I can see unless it is to pile up burdens still higher upon every man or corporation that sees fit to build a street railway, a tramway, or anything of the sort. Yet we are asked to set aside the Senate bill and agree to a report full of such monstrosities, which they seek to pass, as though it was an improvement upon what we had done.

"I will pass over a good many of the changes they have made without comment. They have increased the tax on boiler-iron, on line 569, \$2.20 a ton. They have increased the tax upon polished, planished, or glanced sheet-iron or sheet-steel \$11.20 a ton, although that matter was twice carefully considered; and the Senator from Massachusetts (Mr. Hoar) at last read documents to prove that that class of iron ought to be reduced to two cents per pound. It was reduced on his recommendation, and yet the conferees have put it up again, taxing it \$11.20 a ton more, and inserting a proviso which I have not time to consider carefully, but it means mischief. Let me read it to the Senate. It is a new proviso inserted by them:

"Provided, That plate or sheet or taggers iron, by whatever name designated, other than the polished, planished, or glanced herein provided for, which has been pickled or cleaned by acid, or by any other material or process, and which is cold-rolled, shall pay one quarter cent per pound more duty than the corresponding gauges of common or black sheet or taggers iron.

"We struck that proviso out after deliberate consideration in the Senate, or in committee, because it was shown that all that iron had to be rolled, and the imposition of that additional tax was such a wrong that not one of these gentlemen dared to urge its adoption in the Senate; it was stricken out, as the debate will show, on proof by gentlemen on this floor that the proviso ought not to be retained. Yet when they get themselves in secret conclave,

and with nobody to contradict or expose them, and their report has to be voted on as a whole, because a portion, however vicious or corrupt, if you please, can not be stricken out without defeating the whole measure, they make a bill to suit themselves and their friends. Knowing that there are so many things in the bill that so many men are interested in, they trust that the Senate can not afford to defeat their report.

"Skipping a good many things, I come now to a matter that attracted my attention the moment my eye rested upon it, because it is a subject that the Senate thoroughly understands. The Senator from Ohio, as the Senate will remember, near the close of the discussion brought before us a new amendment to the iron schedule. He presented it on a Saturday morning. I rose to oppose it and said that I did not quite comprehend the full extent and effect of it, but I thought I could find out if I had time allowed me until Monday morning. There were funeral ceremonies to be held at five o'clock that day, and it went over. I had examined it before it was called up on Monday, and when it was understood that the proposition of the Senator from Ohio was to increase the duties on all steel not otherwise enumerated from the present rate of 80 per cent. ad valorem to 45 per cent. ad valorem; that it sought to change the duties on all the classes of Bessemer steel however made, whether by the pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or any other process, imposing a tax of 45 per cent. upon a certain grade, changing classifications and adding to the duties on them by indirect methods, the Senate refused to accept his amendments. Upon a full, fair, and free discussion in this body, and an explanation of the effect of his propositions, we defeated him in his efforts to tax steel 45 per cent., and held it at 80. We defeated the proposed increase to 45 per cent. duty upon Bessemer steel and made it 40. We kept him from raising the duty on crucible steel and changing the classification in the way he proposed, greatly to the disgust of the Senator from Ohio. Yet after that defeat, perhaps smarting under it, wanting to take revenge on the country and on the Senate, he goes into this so-called conference committee and has restored in this report every provision that the Senate had voted down after full debate when he sought to impose them upon us. In the amendments that I have exhibited from this conference report he has placed all the manufactures of steel at the points I have indicated. I say *he*; I speak of the Senator from Ohio, because he is the leader of this movement in courage and audacity and intellect. I know who drove the conference; I see the tracks, though he does not sign the report; I know who had iron-ore and pig-iron increased. It is a Sherman-Mahone tariff now, as to all the paragraphs in the iron schedule. Senators will observe that in the report all our action in the Senate as to steel is overthrown and the defeated proposition of the Senator

from Ohio is substituted. I never knew a more insolent, not to say insulting, proposition made by one member of a body to the body that has trusted him with power and ordered him to maintain its position. There was no House disagreeing vote to meet or combat, the wishes of the Senate and the rights of the people were simply disregarded, and the private wishes and interests of the conferees consulted. Let me read from the report:

"All of the above classes of steel not otherwise specially provided for in this act, valued at 4 cents a pound or less, 45 per cent. ad valorem; above 4 cents a pound and not above 7 cents per pound, 2 cents per pound; valued above 7 cents and not above 10 cents per pound, 2½ cents per pound; valued at above 10 cents per pound, 3½ cents per pound.

"'Forty-five' is substituted for '40,' '4 cents' for '5,' '7' for '9'—in short, all our work is disregarded. I explained the effects of the proposed amendments on the 20th of February, and can not better show the effect of the report than by reading now what I said then:

"Now, the Senator from Ohio proposes upon all steel embraced in this class—'Above 4 cents a pound and not above 7 cents, 2 cents per pound.'

"Therefore his proposition is to add \$22.40 a ton on all that class of steel valued at over 4 and not over 5 cents a pound. That, I expect, embraces a large class of steel used in this country, or why the proposed change in classification? Yet we were told on Friday night that there was to be no increase on the lower grades by the amendment. I have read the lines fixing 1 cent a pound on all these steels made by the Bessemer process as agreed to in Committee of the Whole and in the Senate. The Senator from Ohio has changed the classification. Why, I do not know, except to suit the iron-masters. He has changed it so as to put \$22.40 a ton additional upon all that class of Bessemer steel that is valued not above 5 cents and above 4. Why that was done perhaps he can explain.

"What next does he do? The Senate bill in the lines that he last proposes to strike out, as to crucible cast-steel ingots and these other matters, makes this provision:

"'Crucible cast-steel ingots, cogged ingots, blooms, and slabs, etc., valued at 5 cents per pound or less, 1½ cent per pound.'

"The Senator from Ohio promises whenever it is valued at over 4 cents to make that crucible steel pay 2 cents per pound, so that on that class of goods he adds \$11.20 per ton; and on all that is valued between 4 and 5 cents a pound by a change of classification, \$22.40 per ton on the lower grades of Bessemer steel by striking out the lines he first proposed to strike out; and now, by the lines he last proposes to strike out, and the valuation that he puts and the tax he imposes, \$11.20 a ton on all crucible steel valued between 4 and 5 cents per pound. That is the next step.

"What next does he do? The Senate provided that upon all crucible cast-steel valued at 5 cents and not above 9 cents per pound, the tax should be 2 cents per pound; valued at above 9 cents a pound, 2½ cents per pound. That is the maximum, with only two classifications above 5 cents. What does the Senator from Ohio propose? On steel valued at from 4 to 7 cents a pound, 2 cents a pound; from 7 to 11, 2½ cents a pound; and from 11 up, 3½ cents a pound.

"I have shown that he has put \$22.40 a ton by the change of classification on the lower grades of Bessemer steel; that he has put \$11.20 a ton on the grades of crucible steel valued between 4 and 5 cents, and he now proposes to change the duty on that valued between 4 and 7 cents to 2 cents a pound, the Senate

having placed it from 5 to 9 at 2 cents a pound, he proposes from 7 to 11 to fix the rate at 2½ cents a pound. In other words, he increases three fourths of a cent a pound or \$16.80 a ton upon all that grade of steel valued at from 7 and not more than 9 cents a pound, and there is where another large importation is made, as you will see if you look at the tables. Sixteen dollars and eighty cents per ton over the Senate bill is proposed upon all steel with from 7 to 9 cents a pound, and then he makes a classification we have not made at all, because from 9 up we made all at 2½ cents, and he makes it from 7 to 11, 2½ cents; and from 11 up, 3½ cents. So that upon all steel of all sorts valued at above 9 cents a pound he adds \$16.80 per ton.

"How many millions that adds to the taxes of this people I do not know. It is all done for the benefit of a very few establishments in Pittsburg and elsewhere, whose owners confess that they drew this bill, and who are now seeking to urge Senators to defeat it unless they add to its already onerous taxation all they want.

"I showed during that debate what would be the effect of an increase on steel from 30 to 45 per cent. I will again read from my speech of that date:

"I have looked over it since Saturday, and I will state how I understand this amendment will leave the bill if adopted. The clause as to 'steel not specially enumerated or provided for in this act' is to be delayed for a few minutes, but it is part of the amendment. Steel not otherwise provided for under the existing law now pays 30 per cent. ad valorem. Under that the importations for the year 1882 amounted in value to \$5,742,512, and the duty paid was \$1,723,352. The Senator from Ohio now proposes to increase this tax to 45 per cent.

"Though we defeated all his propositions then, he has them in such a shape now that we can not even get a separate vote on them, though he could not insert them after discussion in the Senate. He can do it in secret, though defeated when Senators representing States and tax-payers could meet him face to face in fair debate.

"I stated further, in February:

"If the same value of imports continue, the duty that he proposes to impose would be \$2,584,980, or an increase of duties on the same value of goods of \$761,578; and of course all the products of this country, which is perhaps six times as much as the imports, or perhaps ten times as much, will be increased in the same ratio. In other words, 50 per cent. is to be added to the duties now imposed by law, by the amendment of the Senator from Ohio, upon all steel not otherwise provided for in this act which is consumed in this country, whether made at home or abroad.

"Substantially the same presentation was made by the Senator from Alabama and the Senator from Texas, and perhaps by other Senators, the Senator from North Carolina, I have no doubt, though I do not recollect that he participated in regard to that item, but he was always ready and able, and I assume he took part in it. I know the Senator from Delaware did; in short, the Senate rejected all the amendments of the Senator from Ohio which he has now put into this conference report. I say it requires an audacity that few men possess to insert into a conference report every defeated amendment after the exposure that was made as to the effect of the increased tax-

ation upon the people, and ask us to accept it or tell the country that we shall be responsible for the defeat of this bill without even venturing a word of explanation or deigning to tell us that a majority of the House conferees even asked to have it done. I hardly think they did.

"I shall vote against this report for this among other causes. It is made up against the interest of the people of this country, against the will of both Houses of Congress. I have shown that as to steel rails the taxation imposed is beyond what either House voted; I have shown that as to iron-ore that the two Houses had agreed, and yet 50 per cent. more taxation is sought to be imposed, and hundreds of thousands of dollars added by this conference committee to the burdens of the people. I propose to vote against it, and my word for it, if this report could be defeated we should tell the House of Representatives, as we truly can, that 'we have sent you a better bill in our amendment than this conference report proposes. You had far better vote for the Senate amendments that your leaders would not allow you even a chance to concur with us in, believing that they would frame in secret a worse bill than the Senate had sent; they knew that they would satisfy the pig-iron men and the great manufacturing monopolists of the country better than the action of the Senate would if we reject this conference report as we ought to do because of the outrageous provisions in it'—my word for it, the House to-morrow morning will demand a right to vote upon the question of concurring in the amendments originally sent them by the Senate which are now upon their table, and will say to their conferees as I now say to ours, 'You have transcended your duty in seeking to impose taxes upon this people beyond what either House had demanded.' That House will take up the Senate bill to-morrow morning, and, in spite of its defects and of the high-protective monopolists, will pass it before high noon to-morrow, as an improvement upon this report and a bill infinitely better than this is.

"If we force upon the House of Representatives by voting for this conference report a bill that is made worse wherever it has been touched, that is not improved anywhere, and deprive them of the right which they have never yet had of voting upon the amended bill we originally sent them, we are simply joining hands with these monopolists in forcing a worse bill upon the House of Representatives than is now upon their table, that they can vote for in half an hour after we reject this. I intend to be no party to any such coercion upon the House, and submit to no such dictation here as this report attempts.

"Why, Mr. President, look for a moment at the sugar schedule. What have they done with it? If I were to take up this report in detail I could scarcely expose one half of its enormities before Congress expired. The chairman said just now in his blindest way that a

slight increase of tax had been imposed on sugar between No. 13 and No. 16; that the refiners wanted more than they had got, but he thought the committee of conference had done reasonably well for them. What do they do? Without touching any other item in the sugar schedule they provide:

"All sugar above No. 13 and not above No. 16 Dutch standard, 2.75 cents per pound.

"Or \$2.75 per one hundred pounds. The Senate had made the duty on that 2.50 cents. The Senate indeed had voted for 2.40 by a vote taken by yeas and nays of nearly 40 to less than 20, according to my recollection. It was first reported before the change at 2.65. The sugar-refiners never publicly asked for more than 2.65. They thought 2.50 was too low; they feared the low tariff on foreign sugars would destroy their monopoly. There might be competition from abroad at 2.50, and they begged for 2.65. The Senate voted for 2.40 on a call of the yeas and nays after full debate by an overwhelming majority. Recollect that the sugars between No. 13 and No. 16 Dutch standard are the table sugars of this country, the only sugars in which the mass of consumers have a direct interest. All the other grades go to the refiner. Thirteen to 16 are the sugars people can use in spite of the refiner and without his aid, and that the plain people do use. Two sixty-five one hundredths was all the refiners asked that ever I heard of, and I believe I have now in my pocket a dozen dispatches when they thought I was to be on the conference committee, begging for 2.65. I do not care to read the names of the men, but here they are; Senators can look at them. The conference committee have made it 2.75 cents per pound.

"That is simply giving the sugar-refiners the monopoly of the sugar business of the country. If not done on purpose, it was done at the dictation of large sugar-refiners whom I can name. It is the worst outrage in this bill. No man can justify it. You will observe that under the existing law there are hardly any importations of sugar above No. 13. Turn to the schedule again and look at it; but I have looked at that so often that I may as well assume that the Senate understands it. If necessary I will hand the figures to the reporter.

"All the sugar that is imported substantially comes in under No. 13, and this increase from 2½ to 2¾ cents a pound gives to the sugar-refiner an absolute monopoly of the sugar in this country, and imposes burdens upon the many who consume sugar all over America of millions upon millions of dollars. This is done exactly in the same spirit that the other high taxes were imposed, to build up great monopolies at the expense both of the revenue and of the consumers of the country.

"The refiners desired an increase from 2.50 to 2.65. Of course they would ask for 3; they would ask for anything; but 2.75, an increase of 25 cents on the 100 pounds on that grade of

sugar, is nothing more nor less than a proposition in the interest of the absolute monopoly of sugar-refiners. There is not a man on the conference committee who will venture to rise in his place and defend this action in the face of the debates we had, in the face of the votes we took, and he will not dare to say that he either did or would have ventured upon this floor to have proposed to impose a tax on sugar graded from No. 18 to No. 16 at 2·75 cents. The Senator from Vermont himself begged me to make it 2·50, declaring publicly that 2·50 was satisfactory to him after we had voted the tax at 2·40. Many of my friends on this side of the chamber who had voted for 2·40 with me were quite annoyed when I begged them to yield to the urgent request of the Senator from Vermont, as perhaps we had put it a little too low at 2·40. I remember well that the Senator from Texas was not very much pleased at the change being consented to.

"Now, sir, notwithstanding the Senator from Vermont did not venture to ask us to go above 2·50, and no sugar-refiner ever pretended that he could decently ask us to go above 2·65, and all the telegrams I received when they thought I was to be a member of the committee said that 2·65 was all they would ask, the Senator from Vermont and his *confères* on the committee give them 2·75, making their monopoly absolute, making them masters of the sugar business of America, and putting every sugar-consumer absolutely at their mercy; yet the chairman of the conference calls with apparent confidence on the representatives of the people and the States to adopt and sanction that among other outrages. I propose to be as respectful as I can be consistent with truth, but if any milder word than robbery of the people to enrich already gorged monopolies will express my opinion I do not at this moment recall it. The conferees give the refiners one fourth of a cent a pound on all the sugar consumed in this country by excluding competition. The combination of refiners, of course, charge the people one quarter of a cent more than they could under our bill. The sugar consumed annually exceeds 2,000,000,000 pounds, worth over \$85,000,000. This robbery or rather sneaking larceny of one quarter of a cent a pound from the people is a gift, in defiance of our often-expressed will, of over \$5,000,000. That alone ought to condemn this report and the men who seek to force it upon us, if all else was right."

American Shipping.—Early in the session a bill was reported from the Committee on Commerce for the removal of certain burdens on the American marine and the encouragement of the American foreign trade. It was based on the report of the joint select committee on American shipping, appointed at the previous session, and came up in the House for discussion Jan. 6, 1883, and was read as follows:

Be it enacted, etc., That section 4181 of the Revised Statutes be amended so as to read as follows:

"Sec. 4181. Vessels registered pursuant to law, and no others, except such as shall be duly qualified according to law for carrying on the coast trade and fisheries, or one of them, shall be deemed vessels of the United States, and entitled to the benefits and privileges appertaining to such vessels; but they shall not enjoy the same longer than they shall continue to be wholly owned by citizens and to be commanded by a citizen of the United States."

Sec. 2. That section 4219 of the Revised Statutes be amended by striking out the following words in the last clause: "And any vessel any officer of which shall not be a citizen of the United States shall pay a tax of 50 cents per ton."

Sec. 3. That section 4580 of the Revised Statutes be amended so as to read as follows:

"Sec. 4580. Upon the application of any seaman to a consular officer for a discharge, if it appears to such officer that said seaman is entitled to his discharge under any act of Congress or according to the general principles or usages of maritime law as recognized in the United States, the officer shall discharge said seaman, and require from the master of said vessel, before such discharge shall be made, payment of the wages which may then be due said seaman. When a seaman is discharged by reason of inability to perform his duties, whether in consequence of illness or other causes, the master shall be required to pay him only the wages due at the time of discharge. But if any seaman is discharged in consequence of any hurt or injury received while in the service of the ship, or illness caused by a want of such food, water, accommodations, medicines, or antiscorbutics as are required by law, the master shall be required to pay the expense of providing the necessary surgical and medical advice, with attendance and medicines, until said seaman is cured, or dies, or is brought back to some port in the United States."

Sec. 4. That section 4583 of the Revised Statutes be amended so as to read as follows:

"Sec. 4583. No payment of extra wages shall be required, upon the discharge of any seaman in a foreign country upon the termination of his agreement, or in cases where vessels are wrecked or stranded, or condemned as unfit for service. If any consular officer, upon the complaint of any seaman that he has fulfilled his contract, or that the voyage is continued contrary to his agreement, is satisfied that the contract has expired, or that the voyage has not been continued by circumstances within the control of the master, he shall discharge the mariner; but in case the consular officer shall be satisfied that the master has designedly continued the voyage, he shall require from said master the payment of one month's extra pay over and above the wages due at the time of discharge; but in case the master of the vessel shall provide said seaman with adequate employment on board some other ship bound to the port at which he was originally shipped, or to some other port, as may be agreed upon by him, or furnish the means of sending him back to such port, or provide him with a passage home, or deposit with the consular officer such a sum of money as is by such officer deemed sufficient to defray the expenses of his subsistence and passage home, then no payment of extra wages shall be required."

Sec. 5. That section 4582 of the Revised Statutes be amended so as to read as follows:

"Sec. 4582. Whenever a vessel belonging to a citizen of the United States is sold in a foreign country, and her company discharged, it shall be the duty of the master to produce to the consul or officer the certified list of his ship's company, and also the shipping articles, and to pay to said consul or officer for every seaman so discharged one month's pay over and above the wages which may then be due to such seaman; but in case the master of the vessel so sold shall provide such seaman with adequate employment on board some other ship bound to the port at which he was originally shipped, or to such other port as may

be agreed upon by him, or furnish the means of sending back to such port, or provide him with a passage home, or deposit with the consular officer such a sum of money as is by such officer deemed sufficient to defray the expenses of his subsistence and passage home, then no payment of extra wages shall be required."

Sec. 6. That section 4600 of the Revised Statutes be amended so as to read as follows:

"Sec. 4600. It shall be the duty of consular officers to reclaim deserters and discountenance insubordination by every means within their power, and where the local authorities can be usefully employed for that purpose, to lend their aid and use their exertions to that end in the most effectual manner. In all cases where deserters are apprehended consular officers shall inquire into the facts; and if he is satisfied that the desertion was caused by unusual or cruel treatment, the seaman shall be discharged, and receive in addition to his wages to the time of his discharge, one month's pay, or the master shall provide him with adequate employment on board some other ship bound to the port at which he was originally shipped, or to such other port as may be agreed upon by him, or furnish the means of sending him back to such port, or provide him with a passage home, or deposit with the consular officer such a sum of money as is by such officer deemed sufficient to defray the expenses of his subsistence and passage home. And the officer discharging him shall enter upon the crew-list and shipping articles the cause of discharge and the particulars in which the cruelty or unusual treatment consisted, and the facts as to his discharge, or re-engagement, as the case may be, and subscribe his name thereto officially."

Sec. 7. That section 4581 of the Revised Statutes be amended so as to read as follows:

"Sec. 4581. That if any consular officer, when discharging any seaman, shall neglect to require the payment of and collect the extra wages and charges required to be paid in the case of the discharge of any seaman, he shall be accountable to such seaman to the full amount thereof; and if any seaman shall, after his discharge, have incurred any expense for board or other necessities at the place of his discharge, before shipping again, such expense shall be paid out of the wages to which he shall be entitled, which shall be retained for that purpose, and the balance only paid over to him."

Sec. 8. That section 4584 of the Revised Statutes be amended so as to read as follows:

"Sec. 4584. Whenever any consular officer, upon the discharge of any seaman, receives the wages due to said seaman, he shall at once pay the same to the said seaman, except as provided by section 4581 of the Revised Statutes."

Sec. 9. That section 4578 of the Revised Statutes be amended so as to read as follows:

"Sec. 4578. All masters of vessels belonging to citizens of the United States and bound to some port of the same are required to take such destitute seamen on board their vessels, at the request of the consuls, vice-consuls, commercial agents, or vice-commercial agents, respectively, and to transport them to the port in the United States to which such vessel may be bound, on such terms, not exceeding \$10 for each person, as may be agreed between the master and the consul or officer. But for long voyages and peculiar disabled condition of such seamen there shall be allowed to the master or owner of such vessel such reasonable compensation, not to exceed 30 cents per day, in addition to the allowances herein provided, as shall be deemed equitable by the collector of the port in the United States which the vessel may first reach, the same to be paid under such regulations as may be prescribed by the Secretary of the Treasury. Every such master who refuses the same, on the request or order of such consul or officer, shall be liable to the United States in a penalty of \$100 for each seaman so refused. The certificate of any such consul or officer,

given under his hand and official seal, shall be presumptive evidence of such refusal in any court of law having jurisdiction for the recovery of the penalty. No master of any vessel shall, however, be obliged to take a greater number than two men to every one hundred tons burden of the vessel on any one voyage."

Sec. 10. That no fees shall hereafter be charged by any consular officer for any certificate, manifest, or other official service to American vessels engaged in the foreign trade, or to the owners, officers, or seamen of such vessels. Consular officers who are now paid in whole or in part by fees shall make a detailed report to the Secretary of the Treasury of the services performed in accordance with this section, with the fees heretofore allowed in such cases, and shall be entitled to receive the amount thereof in the same manner as is provided by law in case of other compensation payable by the United States.

Sec. 11. That it shall be, and is hereby, made unlawful in any case to pay any seaman wages in advance of the time when he has actually earned the same, or to pay such advance wages to any other person, or to pay any person any remuneration for the shipment of seamen. Any person paying such advance wages or such remuneration, shall be deemed guilty of a misdemeanor, and upon conviction shall be punished by a fine not less than four times the amount of the wages so advanced or remuneration so paid, and may be also imprisoned for a period not exceeding six months, at the discretion of the court. The payment of such advance wages or remuneration shall in no case absolve the steamer, ship, or vessel, or the master or owner thereof, from full payment of wages after the same shall have been actually earned, and shall be no defense to a libel suit, or action for the recovery of such wages: *Provided*, That this section shall not apply to such fees as by any law of the United States may be collected by any shipping commissioner or other officer of the United States for the shipment of seamen. This section shall apply as well to foreign vessels as to vessels of the United States; and any foreign vessel, the master, owner, consignee, or agent of which has violated this section, or induced or connived at its violation, shall be refused a clearance from any port of the United States.

Sec. 12. That every vessel mentioned in the preceding section shall also be provided with a slop-chest, which shall contain a complement of clothing for the intended voyage for each seaman employed, including boots or shoes, hats or caps, under-clothing and outer clothing, oiled clothing, and everything necessary for the wear of the seaman; also a full supply of tobacco and blankets. Any of the contents of the slop-chest shall be sold, from time to time, to any or every seaman applying therefor, for his own use, at a profit not exceeding 25 per cent. of the reasonable wholesale value of the same at the port at which the voyage commenced.

Sec. 13. That all masters and owners of vessels shall have the right to ship and pay off the men they employ.

Sec. 14. That section 2514 of the Revised Statutes be amended so as to read as follows:

"Sec. 2514. That all articles and materials of foreign production needed for the repair of vessels engaged in the foreign trade, including the trade between the Atlantic and Pacific ports of the United States, and all ship stores, cordage, rigging, canvas for sails, and coal to be used and consumed on board of any such vessel, may be withdrawn from bonded warehouses free of duty, under such regulations as the Secretary of the Treasury may prescribe."

Sec. 15. That no vessel engaged in commerce with the Dominion of Canada or the Republic of Mexico shall be subject to tonnage tax or duty, nor shall consular certificates be required from the same.

Sec. 16. That instead of the assessment of 40 cents per month, authorized by sections 4585 and 4587 of the Revised Statutes of the United States, there shall hereafter be assessed and collected 30 cents.

SEC. 17. That the individual liability of a ship-owner shall be limited to the proportion of any or all debts and liabilities that his individual share of the vessel bears to the whole.

SEC. 18. That when any vessel, whether steam or sail, shall be constructed and equipped in the United States for the foreign trade, including the trade between the Atlantic and the Pacific ports of the United States, in whole or in part of materials of the production of the United States, the owner or owners of such vessel shall be entitled to receive and collect from the United States a drawback or sum equal in amount to the duty which would have been collected upon imported materials of like description and of equal quality with the American materials used in the construction, equipment, engines, boilers, and other appurtenances of such steam or sail vessel: *Provided*, That in ascertaining such drawback the duties on such iron or steel materials shall be computed on iron and steel advanced in manufacture not beyond the point of plates, angles, bars, and rods: *And provided further*, That this section shall apply only to vessels commenced after the passage of this act.

SEC. 19. That such sums shall be paid in the same manner and from the same funds as drawbacks on customs duties, and under such regulations as may be adopted from time to time by the Secretary of the Treasury, and shall be adjusted and the amount thereof determined prior to the registry of such ship or vessel.

SEC. 20. That the certificate of registry of every such ship or vessel shall be entitled "Certificate of registry under an act to remove certain burdens on the American merchant marine, to encourage the American foreign carrying trade, and so forth," and shall contain a prohibition of such ship or vessel engaging in the coasting trade, except between ports on the Atlantic and ports on the Pacific. Every such certificate shall have indorsed upon it the amount paid or adjusted to be paid to the owner under this act. Every renewal of the registry shall be in like form. Should any vessel so registered be about to engage in the coasting trade, other than that between ports on the Atlantic and ports on the Pacific, the owners must first surrender such certificate of registry, repay to the collector of customs to whom the certificate is surrendered the sum indorsed thereon, and take out a new certificate of registry or of enrollment in ordinary form. Should any ship or vessel, registered as hereinbefore provided, engage in the coasting trade other than that between ports on the Atlantic and ports on the Pacific, without surrender of such certificate, as hereinbefore provided, or without repayment of the amount indorsed thereon, or without taking out a new certificate of registry or enrollment in ordinary form, she shall be subject to a fine of double the amount indorsed on such original certificate of registry; which fine shall be a lien on such ship or vessel, and shall be ascertained and collected at suit of the United States *in rem* in admiralty against such ship or vessel in the district court of the United States for the proper district; such suit to be governed by the laws, rules, and regulations pertaining to other suits in admiralty.

SEC. 21. That when a steam or sailing vessel is built in the United States for foreign account, wholly or partly of foreign materials on which import duties have been paid, there shall be allowed on such vessel, when exported, a drawback equal in amount to the duty paid on such materials, to be ascertained under such regulations as may be prescribed by the Secretary of the Treasury. Ten per cent. of the amount of such drawback so allowed shall, however, be retained for the use of the United States by the collector paying the same.

SEC. 22. That all registered ships, steamers, or vessels employed exclusively in the foreign carrying-trade, including the trade between the Atlantic and Pacific ports of the United States, are hereby exempted from all or any State or municipal taxation.

SEC. 23. That all acts and parts of acts in conflict with this act are hereby repealed.

Mr. Cox, of New York, opened the discussion on the part of the minority of the committee:

"Mr. Speaker, in most cases, either of social or physical grievance or disease, the way to reach the remedy is to study the causes so as to remove them. The sickness even unto death of our marine is a partial exception to this mode of treatment. Many of the causes which produced the effect which we deplore have done their worst and have expired as active energies. To their operation have been added new causes, which congressional supineness and injurious policies have intensified. So that, indeed, it may be said that if our navigation and commerce are to be restored the remedy must be as heroic as the case is desperate.

"It is beyond doubt that the origin of our navigation laws was a compact with slavery. This David A. Wells has shown most vividly in his volume on the 'Mercantile Marine.' New England was engaged in shipping and in transporting and selling slaves to the South. She desired to hold the monopoly of that trade. This she procured for a period, by the extension of the time for the extinction of the slave-trade to 1808. The compact was completed by the navigation laws of 1790 and 1792. Tonnage dues and imposts gave to the American the entire commerce and prohibited foreign ship-owners from engaging in our trade. Again, in 1816, 1817, and 1820 the odious British navigation laws against which our fathers rebelled, were re-enacted by Congress. Every discrimination possible was made against foreigners.

"These laws, whose origin is found in the horrors of the middle passage, and whose history is a part of the most disgraceful experience of our country, have ceased to protect American shipping.

"Indeed, the protection of these laws, by the whirligig and revenges of time, is given to the foreigner, to the Briton. We drive to him the carrying of our persons and property; load him with largesses of freight and fare, and forbid our own people from enjoying even a share in the hundred and odd millions which our laws transfer out of our produce and producers to the pocket of the foreigner! If this be done to protect our ship-builder, it fails; if it be done to protect our ship-owner, it fails. The owner if he would build here must do it at a loss of 15 or 30 per cent. If he would buy, he must buy ships only thus built. Thus builder and owner are burdened by the clinging of this Old Man of the Sea. If we can build as cheap here as abroad, we need no protection; if we can not build as cheap here as abroad, who can afford to buy? The sea is open field, where the guerdon falls to him who can procure his vessel in the best market.

"This open competition, as to the purchase and use of ships of all kinds, has changed, or

ought to change, the laws which govern our marine. The laws of eighty years ago are not suited to our changed condition. Those laws suited sail, not iron or steam. As soon think of returning to the stage-coach or the footman for land conveyance, or to the skin boat of the Esquimaux or junk of the Chinese for sea transportation, as to run the ocean-fleet of to-day under the ancient laws. Nay, as well think of discarding the new motors of physics and their energies as return even to the wooden paddles of the early Cunarder, with its petty 1,200 tonnage and its little subsidy.

"Thus the very causes which produced our disasters are as obsolete and inoperative as the slave-trade itself. The very model upon which our navigation laws were molded has been shattered, and our shipping to-day, with all these restrictions, guards, and prohibitions, is as useless and uninteresting as the 'fat weed that rots on Lethé's wharf.'

"It matters, therefore, little, to examine into the causes which produced the decay of our marine. When we see other nations improving their marine by liberal policies while our Government has neglected to adopt them, the solution is easy. As well expect the boor of Russia, with his old modes of farming his wheat, to compete with the American farmer with his new implements of labor and time-saving, as the United States rival Germany and England in shipping without the marine instrumentalities which these nations employ.

"It matters more to examine the existing obstacles to the resuscitation of our shipping interests. Can we remove them if we find them? Are they of such a nature that enacting or repealing laws will bring the desired relief?

"One stubborn obstacle which time and social changes alone can remove is referred to in the minority report. It is the diversion of our energies to other pursuits more profitable.

"It is not likely,' say the minority, 'that any great increase or revival will take place until we have reached the maximum in other lines of labor and enterprise, especially in agriculture. When that point is reached and our energies are diverted to other pursuits, the ocean may have its olden attraction and remuneration for our people.'

"The census reports our marvelous opulence in flock and field, in mine and mill. We are producers of food for ourselves and mankind; oil, gold, silver, and coal, and railroads beyond the wildest dreams, all the results of natural wealth and applied industry; yet we are so poor that the \$140,000,000 of the carrying-trade, whose Pactolian current should be ours, is turned from us. At the end of the fiscal year 1882 we had a tonnage of 4,165,983 in that business, of which 1,292,294 was in the foreign carrying-trade. Yet the coasting trade grew and railroad transportation grew. In ten years from 1871 to 1881 the miles of railroad leaped up from 60,288 to 104,813, and exports from our farms more than quadrupled.

Export has grown wonderfully, but your railroad magnate is petted by bonds and lands and monopolizing charters. He may own a railroad and not hide his property under a foreign flag. He may not ignore his civic right, while the American ship-owner must cringe down below the hatchway while the Spanish flag of blood and gold, or the British union-jack, or the Norwegian and German ensigns, float over his clandestine property.

"It is notorious that not a little of foreign tonnage is owned by Americans. The form in which it is hidden, by corporations and mortgage, is explained in the testimony.

"The 'Red Star' line between Antwerp and the United States is nine tenths owned in Pennsylvania. Their ships are building on the Mersey. They asked proposals from our ship-builders, and found them 15 per cent. more than the foreign ship-builders; and they were compelled to go under foreign flags.

"In fact, the best part of the capital of our country employed in shipping or ship-using is under alien flags.

"Another and kindred reason for the loss of our carrying-trade and the failure to restore it, is that other countries have laid hands on that which slipped from us in our preoccupation during the civil war. For others, vessels are now at work; for others, vessels are being built on the best models. The seamen, the skill, the capital, and the enterprise of others hold the lines of sea adventure. Possession, with its concomitant advantages, is not ours. We have to struggle valiantly for what others have already.

"So that, Mr. Speaker, to remove this mountain in our path we must remodel the whole industrial system of our own half-hemisphere, and we must turn and overturn natural laws of supply and demand in other spheres of labor and locality. This being impossible, what remains for us except tentative legislation, the repeal of burdens on navigation here, of a liability on a ship-owner there, a reasonable compensation for mails, in many directions; and as the best thing, in the judgment of our wisest economists and merchants, freedom for all stores and materials and liberty to purchase vessels wherever we please to buy.

"If these remedies fail, then the country must await some catastrophe in the shape of a great foreign war, which, like the Crimean, calls our marine into being and activity; but even then we must have the right to buy freely, else it will be useless to regard the opportunity. Or perhaps some exceptional progress may be made in the building of ships or the motive power of its enginery. This may give us a fresh start and added momentum, such as England received in her iron-ship building.

"One needed reform is to do at our ports what other countries do—allow unlimited warehousing of goods, that shippers and merchants may make up a variety of cargo. We have a law which forfeits to the Government (section

2971 Revised Statutes) goods in bonded warehouses after three years. It is a blow at foreign commerce.

"Not the least among the efficient causes which embarrass our shipping are the taxes placed upon our ships in foreign ports. Spain is especially odious on this account.

"I do not therefore greatly rely upon any method proposed by the majority for the revival of our ship-building and ship-using, although I must commend the perspicuous energy and intelligence of the gentleman from Maine (Mr. Dingley). They urge through his bill and report, various schemes besides those in the reported bill, but make no section in the bill to carry them out; as, for instance, a system of postal charge, of apprenticeship, and a board of trade.

"State as well as Federal legislation is needed. There are certain necessities for the revival of navigation and commerce, which do not depend upon congressional legislation. They are under State and municipal control, such as pilotage, wharfage, harbor-masters' dues, quarantine fees, port-wardens' duties. But these, like the other minor matters of the bill of the committee, are but feeble auxiliaries in the labor of regaining our mercantile supremacy.

"The relief, whatever it is, must come as well to the ship-using as to the ship-building interest. Even if we remove all the burdens upon the use of ships, it will avail nothing so long as the ships can not be bought or made as cheaply at home as abroad.

"If, therefore, our tariff laws will not allow us to build nor our navigation laws to buy, of what use is the bill of the majority? What is the necessity of taking burdens from the running of vessels which we have not and can not buy or build?

"Hence the minority report explicitly says that—

"While the committee are generally agreed upon the measures proposed, the minority are constrained to notice the fact that the most vital and prominent relief, by the freedom of materials for ships from customs dues, and the right to purchase ships abroad, is utterly ignored in the majority report. In the opinion of the minority, nothing could be more futile, not to say absurd, than to deal with a vital disease by remedies which only affect the superficial ailments whose removal would leave the patient in as dangerous a plight as ever.

"Go on, gentlemen! Modify your shipping laws, remove burdens, extend privileges, copy the British code! We will aid you in the experiment as far as you go, and would bid you go further, to fare better. Compensate for mail service; make ship-supplies free; adapt your rules to the new class of seamen; make a new and inexpensive consular code for their discharge and return home; prohibit the advance wages and 'blood-money'; allow a Norwegian or Italian to be an American mate; limit the liability of ship-owners; reduce the hospital-tax; modify the tonnage-tax, or repeal it altogether; erase from every State statute

the local taxation on shipping; ay, even erect a bureau like the British Board of Trade as the special cherub to keep watch over poor Jack; do all these as your committee suggest. Do more! Out of your treasury, or out of the tonnage fund, mostly collected from foreign shipping, make a sort of allowance for the use of certain American materials in building ships; and yet, like the young man in Scripture, one thing ye will lack. You may copy the English statutes, as liberalized in 1849 in allowing Englishmen to buy ships where they pleased, and in 1854, when they opened their coasting trade to all the world. 'Begin,' as your majority say Great Britain did (p. 8), 'begin a complete revision of the merchant-shipping statutes, so as to remove every obstacle and give every facility,' and then you may have some dim hope of the resurrection of our wrecked marine!

"I pause here, Mr. Speaker, to ask, first, what are our navigation laws? Wherein do they obstruct the revival of our shipping?

"Briefly they are: That a vessel of the United States engaged in the foreign trade must be registered to entitle it to the rights and privileges of a vessel of the United States; and to be so registered must be built within the United States and belong wholly to citizens of the United States, or be captured in war and condemned as a prize, or be adjudged forfeited for breach of the laws of the United States, being wholly owned by citizens of the United States. No vessel can be registered, or, if registered, entitled to the benefits and privileges of a vessel of the United States, if owned in whole or in part by any citizen of the United States who usually resides in a foreign country, during the continuance of such residence, unless he be a consul of the United States or agent for a partner in some house of trade consisting of citizens of the United States, actually carrying on trade within the United States, or if owned in whole or in part by any naturalized citizen of the United States who resides more than one year in the country from which he came, or for more than two years in any foreign country, unless he be a consul or agent of the United States. No vessel registered as a vessel of the United States licensed or authorized to sail under a foreign flag and to have the protection of any foreign government during the existence of the rebellion can be deemed or registered as a vessel of the United States, or to have the rights and privileges of such vessels, except under provisions of law especially authorizing such register. A register may be issued to a vessel built in a foreign country when such vessel shall be wrecked in the United States and be purchased and repaired by a citizen of the United States, if the repairs equal three fourths of the cost of such vessel when repaired.

"The navigation laws are practically dead for the purpose of their being. Let us—

" . . . rise on stepping-stones
Of their dead selves to higher things.

"Is it not, Mr. Speaker, marvelous that in this majority report the confession is naively made that our merchant shipping laws remain the same as they were originally framed more than fourscore years ago, and that they were all that were needed so long as the English laws were the same? And yet the majority stop short of the one prominent and majestic feature of the newly-constituted English system—liberty to build and buy! The majority say that 'our error was in not imitating England in so modifying our laws as to give the American marine the same advantages in this respect that English shipping was given under English laws'; and yet it would perpetuate the error by a blindly selfish persistence in the very laws which England repealed! Well, sir, if England is to be our exemplar, if her maritime success is a sign that her laws worked beneficently, then let the obstructions which she removed be removed by us. This the minority propose in the amendments for free materials and free ships.

"Without, therefore, arguing at length any of the lesser propositions in the majority report, it is enough to say that the acquiescence in most of the measures proposed was hearty and earnest by the whole committee; while the reluctance as to one proposition, the 'drawback,' so called, was somewhat mitigated by the belief that the amendment for free materials might prove more acceptable. And if, as the minority hope, both should be adopted, little harm could result, as the nullification of the bad consequences of the one would be nearly perfect by the adoption of the other. Or, if there should be an option allowed the builder to choose either the 'drawback' or free materials under my amendment, the adoption of the drawback thus coupled would not be without some utility. But if no compromise be tendered in the interest of freedom of materials or ships, I want no allowance fixed on the Treasury, no leech to draw its blood such as this drawback will then be.

"The minority had no power to prevent the adoption of the drawback proposed, had they been inclined to balk the majority in this experiment. All the minority could do was to append the proviso to it; that it should only apply to ships begun after the passage of the act.

"This drawback proposition came from the San Francisco Board of Trade. It was offered by the gentleman from California (Mr. Page). It was drafted by an experienced merchant, Mr. Hopkins. It was not written on the Delaware, nor in the interest of the Pacific Mail Steamship Company, as will appear by the fact that their interests are somewhat adverse, because the section is not applicable either to ships already afloat or on the stocks, but only to those which shall have been begun after the passage of the act.

"The reason given for this clause of the bill reported, and which is most controverted, is

set forth by its author, in the speech made before the San Francisco Board of Trade. That speech is entitled to much emphasis. As the sixth of the ninety-three seaports of the United States, San Francisco owned only twelve of the five hundred and fifty vessels loaded at her port for Europe during the harvest year ending June 30, 1882. For that period she paid in freights to Europe by sea, \$16,069,789; and to and from all ports of the Pacific coast, \$25,000,000. Nearly all of these sums went to foreigners. When this appeal for self-interest was made with the patriotic fervor aroused by the thought of our flag, the committee gave the suggestion much favorable thought. Nor would I reproach myself for acquiescence in the entire report could I reconcile it with my old and matured ideas as to protection.

"In urging this measure the San Francisco traders evidently felt the orphanage of navigation and the hopelessness of asking for a repeal of the navigation laws. Which way soever they looked they saw the image of protection, like Pluto's countenance—iron and inexorable. Piteously they pleaded that their plan was 'not a subsidy levied on many industries to benefit a few, but simply the payment of a debt due by the many enterprises which are prospering by means of the tariff to the one which has been ruined by it.' They pleaded as those who owned the cargo which was jettisoned to save the vessel, and that they should be made good by a general average contribution.

"In this rhetorical masquerade they meant to say: 'Behold us, the victims of your robbery! True, you may have robbed us under pleasing disguises; your self-seeking may have made your larcenies unwitting; still, as pirates of the land you have destroyed our fair and free trade upon the water. And as you have thriven upon this piracy, be generous to your despoiled victims, as you have in your coffers the loot you stole from us. Be patriotic and devoted in this paramount matter and in our death-agony! No longer continue to help Great Britain at our expense, after rifling us for the general welfare!'

"It is upon such reasoning as this that we are asked to allow this drawback; and if there be, as Bastiat held, a reciprocity in brigandage, let us steal back from those who stole from us, that we may have some compensation for our losses by the restoration of something of our own. Let us cultivate a mutuality in rascality! (Laughter.)

"Having, then, shown the origin, animus, and *raison d'être* of this so-called drawback in a bill to revive shipping, may I not ask:

"1. Why a tariff which kills an industry so momentous as ship-building should be continued? I have shown in the minority report how the tariff directly ruins ship-building by its enormous burdens on the materials. I have given in Exhibit B a list of the taxes, ad valorem, on the principal materials used in steamship manufacture. They range from 20 to 67

per cent. These should be imported free, fashioned and ready for being put together in the vessel. Certainly, the portion of the labor to be done in putting the parts together may not amount to much; but if it do not, then the cost of the vessel is less. This is a desideratum not to be despised in a desperate case like that of our ship-building, where such odds favor our competitors.

"2. May I not ask why a tariff which kills commerce should be continued? The people are giving answer; but whatever that answer is, the entire and beneficent revision of the tariff, with the resultant reduction in the price of materials and labor, is not contemplated. Nor is the revival of commerce on a large and normal scale likely to happen as the sequence of our tariff reform.

"Commerce means barter, exchange; buying and selling, both. If we would sell our products abroad, we must buy abroad. The tariff, by preventing importations or exchanges, as in the South American examples which the report of the minority shows, destroys commerce. Commerce being absent, of what use is the ship or its revival? Of what use is the telescope if there were no stars, or the spindle without cotton, or any instrumentality without that which gives it employment? So that when we revive commerce by revising the tariff, which is the grand obstacle to reciprocal trade, we make, and make profitable, the means of commerce—namely, ships.

"But it will be said that the revisal of the tariff, especially as to iron, steel, cable and cordage, sail-duck, plank, deals, lumber, wire-rope, rivets, tubes, bolts, pipes, iron screws, etc., touches other interests, and that these are 'protected,' and that the protection is riveted upon our Government as an American policy. This would seem to have been and to be our shackled condition. Nor do I see how to free and enlarge either ship-building or commerce except by the liberalization of our barbarous and prohibitive tariff. The San Francisco traders are more politic. They accept the outrage as accomplished; they regard the tariff as perpetuated. Hence they 'beg'—that is their word—to have the loot returned to them, to draw back the plunder and place it where it will do the most good.

"Well, I say to them, and to my constituents who have been largely interested in both building and using vessels, that just now there is no chance to so revise the tariff on the composite parts of a ship as to allow us to make it as cheap here as it can be made or bought abroad.

"Nor is it possible just now to so revise our tariff as to make our trade with other countries mutual, and thus have incoming as well as outgoing cargoes, which bring paying freightage.

"What then? This and only this as the remedy for the revival of both ship-building and ship-using: purchase in the open market of the finished ship. Repeal the odious navi-

gation laws, so as to allow registry free of duty as to all vessels the same as if built and owned here.

"If I am answered that this will destroy our ship-building, I answer—

"1. That as to wooden ships and ships that are 'auxiliary,' having steam and sail, such as Maine is now making for California, we are assured that we can build as acceptably and as cheaply as any other nation. The last year's showing in Maine demonstrates that her ship-yards are doing well; there being 80,000 tons completed and on the stocks since last year. They need no bounty.

"2. That as to iron or steel vessels, could we be worse off than we are now by any change of fact or law? The catalogue of our iron and steel vessels is the humiliation of our enterprise. It is the one bar sinister on our escutcheon.

"If it be said again that the repeal of the navigation laws will destroy our ship-yards, we reply that there is nothing on our stocks of much general consequence in iron ship-building; and since the business will not remunerate without subsidies or bounties or general taxes on all the people for one interest, let us try the experiment which other nations have tried successfully, namely, buy abroad, since we can not build at home.

"It is argued that, because a great many poor ships are built in England, those are the ships that we would buy if we could! Undoubtedly there are many poor carriages built in England. We are at liberty to import land vehicles, while we can not import vehicles to be used on the water. When we do import carriages we import the best. The Americans are not fools. Let the buyer of a horse or a ship beware. Why should not trade and labor be left a little to natural laws? Are there not regulations more powerful than Congress can make? Repeal burdens and restraints; stop the talk about stimulation; practice non-intervention—these are maxims only less radical and wholesome than the natural prescripts which ordain them.

"Could we have seen ten or twenty years ago to-day what others saw, we might have had to-day a splendid fleet of screw-steamers under our flag. The earnings might have been saved to us. We relied on our own ship-yards, and in 1881 but eight of the 44,463 tons of steamers built on our seaboard were for the ocean, or only 1 per cent. of the British tonnage built the same year. Our citizens, had they been allowed, would have bought the ships of iron and steel we could not build. One of the oldest ship-builders and owners of the United States, formerly a member here, writes me that had we had the privilege of buying iron ships there would to-day have been two hundred of them under our flag; and he says:

"I do not believe there would have been many more ships in the world than at present, only we

should have had our share; our sons would have had employment, and our country would have been so much richer. I have three sons, masters of ships. I shall never build another wooden ship; but I would, if I could, go into the iron ships; they last longer. There have been great improvements in them the past five years, and we would have received the benefit of them.

"Why not allow the merchant, if he thinks he can do it, to get his ship abroad, and try at least to run it? He will not charge the Treasury for his failure and loss.

"In time, as in Germany, the ownership leads to repair, and repair to building. The number of ship-yards and workshops increases, and the tonnage leaps up under this impulse. That which seemed a mustard-seed becomes a mighty tree. Every nation has tried the free-ship experiment but the United States, and we are lowest to-day in our proportionate share of the navigation of the world. No one can say it is a failure until it is tried. All other schemes—and especially its opposite, protection—have been tried and failed. The commercial eminence of Great Britain, not to speak of Germany, France, Italy, and Norway, is supreme logic for the trial of the experiment. Germany is the best illustration; she has not as good coal and iron as we have, but she began to buy her ships on the Clyde, as we might have done a score of years ago. She is now building her own iron steamships. She builds now more than she buys. She has never subsidized. Her tonnage in 1856-'57, when ours began to decline, was but 166,000 tons; last year she had 950,000; ours in eleven years dropped from 4,400,000 to 600,000, and all its vast income was lost.

"Last week I read that a new steel steamship, the *Rugia*, of 6,500 tons, was turned out for our trade from the Vulcan Works at Stettin, warranted for the safety of 1,200 passengers, with steel life-boats and steam steering-gear and a refinement in the reversal of her engines in seven seconds. German growth has been in iron screw-steamers, which she began to buy abroad. They could not afford to wait, this phlegmatic people, for their own ship-yards to arise, but began to repair in the blacksmith shops and little foundries of their 'free towns,' and now, where the little furnaces glowed, mighty engines are made to mate the ocean in its wildest tempest!

"Even Japan has a fleet of fifty-seven iron steamers, and China leaves us laggard and unprogressive. Fifty years of Cathay—nay, twenty years—is worth more than a century of our experience.

"Twenty years ago Norway and Sweden traded with us and had but 20,000 tons in the trade; now they have 850,000. The Viking is abroad, and we are stupidly looking on. Everybody is making money out of our carrying and commerce but ourselves. What avails it that ours is the largest carrying-trade of any nation since we do not do the work? It adds to the humiliation.

"It makes the humiliation worse to consider the losses in money as well as the prestige at sea.

"The gentleman from Pennsylvania (Mr. Randall) has called upon the Treasury for the amount of ocean freights on exports and imports during the year ending June 30, 1882. Much loose understatement will be set at rest by the report. It may be reached by the average percentage on the values. What, then, is the result?

"Aggregate of exports and imports for the fiscal year (exclusive of specie) was \$1,475,132,331, and the freights on this at 20 per cent. would be \$295,036,566. Only about 22 per cent. of the carrying trade is done in American bottoms, so that our freight account for the year would stand thus: Received by American ship-owners, \$42,908,044; received by foreign ship-owners, \$252,128,521. Making every deduction for foreign trade with Canada, Mexico, the West Indies, Hawaiian Islands, Central America, etc., this enormous outlay appears.

"Looking at the wall of adamant which shuts us in from all the world and shuts the world out from us in this once famous enterprise of ours, can we draw hope from the prospect? The gigantic results of a hundred years of national existence and energy are not discouraging. Over mountains and through valleys, upon rivers, across continents and under oceans, our enterprises by rail and telegraph have developed our resources. They astound by their marvels. And yet halting on the shores of two vast oceans we have said to the land, or rather the voice of either ocean has said to these enterprises and products of the mine and field: 'Thus far, but by our help no farther. The illimitable ocean is beyond, and its trident is in another's grasp.' Upon the west we face the Orient, rich in the elements of commerce. We had hoped once that the Pacific would have been an American lake. That hope is dead. On the east we almost touch Europe, with its teeming industries, peoples, and civilizations; but they come to us in their own vessels, and bear away our produce. In this we have no pay, part, nor lot. On the south we were reaching across gulf and sea to the tropics at our doors and to the republics of our continent. Once we had mutual relations with the Dominion on our north; but this and all such visions of material supremacy and splendor have faded. The ocean-coast still gives us its thunderous line of breakers, its seven thousand miles and more, indented with harbors of safety and bays of wondrous beauty. The net-work of our hundred thousand miles of railway still trembles with its immense freight, the garnered opulence of our sky, sun, soil, and mine. Cotton, corn, and petroleum—the triumvirate of our common weal—head the stately procession in which a thousand forms of labor and graces of art move and chant their praises to our smiling and copious land.

"The time was when amid the glory and pride of our country our models of ships and

adventure at sea were the theme of lyre and the praise of eloquence. It was comfort and wealth in peace, hope and safety in war.

"It was the horn of plenty and the nursery of seamen, for the maintenance of our independence and rights. Why should America not have her part in these glories of the sea? Was she not discovered by the genius, daring, and devotion of Columbus? Were not our colonies created into commonwealths by the men who braved the dangers of the sea to found here new empires? Our country is born of the sea! Its freedom is of the wind and wave.

"Shall these praises be forever an echo of the past? Are we to take no part in the enlightenment and progress in science and art, of which commerce is the procreant cause and infallible gauge? Has the sea rolled back and away from us at the command of the insolent monarchs of capital?

"To one born inland the sea has a weird and wondrous mystery. I have studied its moods as a lover those of his mistress. Through the generosity of my fellow-legislators here, we have been able to mitigate somewhat of its terrors. Its enchantment has led me over liquid leagues on leagues to remotest realms. Not alone does it enchant because of its majestic expanse, its resistless force, its depth and unity, its cliffs, bays, and fiords, its chemical qualities, its monstrous forms, its riches and rocks, its tributaries, its graves, its requiem, its murmur of repose and mirror of placid beauty, but for its wrath, peril, and sublimity. These have led adventurous worthies of every age, by sun, star, and compass over its trackless wastes, and returned them for their daring, untold wealth, and the eulogy of history.

"But it is for its refining, civilizing, elevating influences upon our kind that the ocean lifts its mighty minstrelsy. Unhappy that nation which has no part in the successes of the sea! Happy in history those realms, like Tyre, Sidon, Carthage, Greece, Italy, Spain, and Norway, whose gathered glories are symbolized in the trident! Happy in the present are those nations who, under the favoring gales of commerce, the fostering economies of freedom, and the unwavering faith in the guidance of Providence, bear the blessings of varied industry to distant realms and bring back to their own the magnificent fruits of ceaseless interchange! Happy that nation whose poet can raise his voice to herald the hope and humanity of its institutions in the grandeur of the familiar symbol of Longfellow:

"Sail on, O Union, strong and great!
Humanity with all its fears,
With all the hopes of future years,
Is hanging breathless on thy fate!

"Amid this divided marine dominion, in which one power alone has half the rule of the ocean, shall America sit scepterless and forlorn—dethroned, ignoble, dispirited, and disgraced? The ensign of our nationality takes its stars from the vault of heaven. By them brave men

sail. It is now an unknown emblem upon the sea. We welcome every race to our shores in the vessels of other nations. Our enormous surplus, which feeds the world, is for others to bear away. We gaze at the leviathans of commerce entering our harbors and darkening our sky with the pennons of smoke; but the thunder of the engines is under another flag and the shouting of the captains is in an alien tongue. Others distribute the produce, capitalize the moneys, gather the glories, and elevate their institutions by the amenities and benignities of commerce; and we, boasting of our invention, heroism, and freedom, allow the jailers of a hated and selfish policy to place gyves upon our energy, and when we ask for liberty to build and for liberty to buy, imprison our genius in the sight of these splendid achievements.

"Mr. Speaker, if you would that we should once more fly our ensign upon the sea, assist us to take off the burdens from our navigation and give to us the first, last, and best—the indispensable condition of civilization by commerce—liberty."

Mr. Dingley, of Maine, representing the majority of the committee, said: "Mr. Speaker, I agree with the gentleman who has just taken his seat (Mr. Cox, of New York) that there is no subject before Congress more important than that to which this bill addresses itself. The humiliating fact which confronts us is that the American carrying-trade is rapidly declining and the American flag gradually disappearing from the ocean. The following statistics of the Treasury Department tell the story more strikingly than any language can do:

YEARS.	American tonnage in foreign trade.	American tonnage in coastwise trade.	Value of exports and imports.	Per cent. carried in American vessels.
1840	762,888	1,176,694	\$281,227,465	82.9
1845	904,470	1,222,213	281,901,170	81.7
1850	1,489,084	1,797,825	350,087,968	72.5
1855	2,548,858	2,545,235	536,625,266	75.8
1860	2,779,896	2,644,567	762,253,550	66.5
1865	1,518,850	3,381,522	604,412,996	27.7
1870	1,448,946	2,688,247	991,586,889	35.6
1875	1,515,398	3,219,693	1,219,454,544	25.8
1880	1,814,402	2,637,693	1,618,770,688	17.4
1881	1,297,085	2,646,011	1,675,024,818	16.9
1882	1,259,492	2,573,688	1,567,071,700	15.5

"By reference to this table it will be seen that the coastwise trade of the United States is prospering, as well as all our other protected interests. Restricted as it is to American vessels, without competition from abroad, it occupies precisely the same position as all other domestic interests. While the statistics show only a small gain in tonnage over that exhibited in 1855, yet there has been such an increase of steamers as to add materially to the actual carrying-tonnage of vessels engaged in the coastwise trade of the country. In 1855, estimating one ton of steam-vessels as equal to four of sailing-vessels, which is very near the fact as to vessels engaged in the coastwise trade,

we had the equivalent of 4,531,451 tons of sailing-vessels engaged in the coastwise trade.

"In 1881 we had on the same basis the equivalent of 5,975,078 tons, showing a gain in the actual carrying capacity of our coastwise tonnage of 1,893,627 tons, or 80 per cent. It is to be borne in mind also that this increase has been in the face of the fact that the freight capacity of competing railroads has increased 120 per cent. during the last decade. So far, then, as the coastwise trade is concerned it is in a prosperous condition, and while some burdens have been pointed out which should be removed, yet on the whole we may point to it as having to-day more than three times the tonnage of the United Kingdom of Great Britain engaged in similar coastwise trade.

"But it is when we turn to our foreign carrying-trade that we find a humiliating story, told by the statistics of the Treasury Department. The salient facts of these statistics are these: In 1840 82.9 per cent. of all the exports and imports of the United States was carried in American vessels, but in 1882 only 15.5 per cent. was thus carried. Here in forty-two years has been a decline of 67.4 per cent. in the foreign carrying-trade of the United States.

"Looking still closer, as to the time when this decline took place, we find that 16.4 per cent. of it was before the civil war, and 12.2 per cent. since the war, and that the enormous decline of 88.7 per cent. took place during the four years of the conflict. It will thus be seen that the decline of our carrying-trade dates from 1855, and that the decadence before the war was as great as the decline which has taken place since the war.

"We also find, looking at this period, that the decline in the construction of vessels for employment in the foreign trade was as rapid before the war as during any other period since in the history of this country. In 1855 there were 507 vessels built in the United States for the foreign carrying-trade, the highest point reached in our history. In 1856 the number declined to 463; in 1857 to 307; in 1858 to 108; and in 1859 to 107.

"I allude to these facts, Mr. Speaker, in order to remove the impression which has obtained in many quarters, that the decline of our foreign carrying-trade began with the war.

"Now, Mr. Speaker, without going further into the details of that decline, it is important we should be enabled to fix specifically the cause or causes of this decline in order to provide a remedy for it.

"And in the first place I wish to show that the cause of this decadence was not, as my friend from New York (Mr. Cox) alleges, because our commerce has declined. That gentleman was pleased to say that the high tariff of 1861 had caused a decline of our commerce, and that a decline in our exports and imports to be carried necessarily had resulted in giving ocean-carriers less to do.

"It is not true, Mr. Speaker, that there has

been any decline in the foreign commerce of this country since the war. At no period in the history of this country has our foreign commerce increased more rapidly than since 1865. From 1850 to 1880 the population of this country increased 115 per cent., while our foreign commerce increased during that same period 400 per cent., showing that our exports and imports have increased over our population nearly 300 per cent.

"The gentleman from New York was pleased to intimate that the tariff of 1861 had repressed our foreign commerce, which the tariff of 1846 had fostered, and to give this as a reason for the decline of our foreign carrying-trade. But the facts are against him. During the fifteen years from 1846 to 1861, the foreign commerce of this country increased \$528,000,000; but between 1865 and 1880 this commerce increased \$1,000,000,000. In 1855 the imports and exports of the United States were \$586,625,866, of which about \$405,000,000 were carried in American vessels, and only \$181,000,000 in foreign vessels. In 1880 the exports and imports of the United States were \$1,613,770,683, of which American vessels carried only about \$280,000,000. If American vessels had carried the same proportion of the imports and exports of the United States in 1880 which they did in 1855, there would have been \$1,200,000,000 for American tonnage, but instead of that our vessels actually carried less than one fourth of that.

"Looking more closely at the figures, we find that neither the so-called revenue tariff of 1846, nor the modified revenue tariff of 1857, nor the so-called protective tariff of 1861, has exerted any influence over the rise and fall of our foreign carrying-trade. Under the tariff of 1842 our carrying-trade prospered; under the tariff of 1846 it prospered for nine years, and then steadily declined during the remaining six years before the tariff of 1861 was enacted.

"So, Mr. Speaker, we must look for the causes of the decline of our foreign carrying-trade beyond the tariff. Our exports and imports, which represent commerce, have been spread out in every direction, and yet our American carrying-trade has been constantly declining, and consequently it is not any decline of commerce which has caused the difficulty.

"But my friend from New York was pleased to say that the tariff of 1861 prevented any successful competition with the ship-builders of the Clyde in the construction of iron vessels, the inference being that if we had continued the tariff of 1846 all would have been well.

"Let us look at this claim. The duty on iron imposed by the tariff of 1846 was 80 per cent., and the duty on iron imposed by the tariff of 1861 averaged about 40 per cent. Now, this difference of 10 per cent. in these tariffs made a change in the cost of the iron used in ship-building of only a little more than one

quarter of a cent per pound. What would one quarter of a cent a pound have done for us in the competition with English iron-ship builders? Nothing at all. Consequently the difficulty in the construction of iron vessels under the tariff of 1846 was practically as great as the difficulty in their construction under the tariff of 1861.

"I have alluded to this point merely to show that the causes of the decline of the American foreign carrying-trade are outside of any controversy between the friends of a tariff for revenue and a tariff for protection.

"Prof. Sumner, perhaps the ablest advocate of free trade in the United States, thus brushes aside the tariff argument of the gentleman from New York:

"No doubt these changes (from wood to iron and sails to steam) have been the chief cause of the decline of ship-building in this country, and legislation has had only incidental effects. It is a plain fact of history that the decline in ship-building began before the war and the high tariff.—*North American Review*, No. 132.

"It is important, Mr. Speaker, that we should brush aside all of these things which have nothing to do with the problems under consideration, and endeavor to come down to the facts we are investigating and ascertain the causes and devise remedies for the difficulty.

"The gentleman from New York was pleased to intimate that one great cause of the success of the British carrying-trade as against that of the United States, was due to the fact that in 1849 Great Britain modified her navigation laws so as to admit to registry under her laws foreign-built vessels. Now, I have to reply to that suggestion that the facts show quite otherwise. This modification of the British law took place in 1849, it is true; and as its influence was exerted at once, we should reasonably expect, from the importance assigned to the free-ship remedy, a steady gain from that time forward of British tonnage as against American. But an investigation will show the fact is exactly the reverse. From 1849 for three years the merchant-marine of the United States increased more rapidly, as compared with that of the United Kingdom, than ever before in the history of this country. Between 1849 and 1855 the merchant marine of the United States increased 1,877,985 tons, and that of the United Kingdom only 894,828. It was during this period of six years' operation of the free-ship policy of Great Britain that the American merchant marine enjoyed its highest prosperity. This prosperity would have increased after 1855 had it not been for a new factor which appeared in the revolution then fairly inaugurated from wood to iron and sails to steam.

"Even Mr. W. S. Lindsay, the most prominent promoter of the British legislation of 1849, is compelled to admit, in his 'History of Merchant Shipping,' that it was in fact the revolution from wood to iron and sails to

steam, and not the free-ship law, that gave the English merchant marine the advantage of our own which has resulted so disastrously to American tonnage. Speaking of the results of the first year's operations of this law, he says:

"Our [the British] ship-owners naturally viewed with great alarm the rapid strides made by American shipping. Nor were their fears allayed by a reference to the Board of Trade returns, wherein it appeared that while the increase of British shipping had in the year previous to repeal been 393,955 tons, there had been a decrease in the year after repeal of 180,576 tons. Our position appeared, therefore, critical; and had it not been for the resources we held within ourselves [referring to iron, coal, and cheap labor] and the indomitable energy of our people, foreign shipping might then and there have gained an ascendancy which might not afterward have been easily overcome. . . . We had one advantage which our great American competitor did not possess. We had iron in abundance, and about this period we were specially directing our attention to the construction of iron ships to be propelled by the screw.

"Speaking subsequently of the contest for supremacy of the seas between 1853 and 1854, the same distinguished English ship-builder says:

"A very large amount of capital had been invested by Americans in the famous ships employed in the California trade; but even these before the close of 1854 were becoming unremunerative, owing to the competition of British iron and screw steamers, which were the main weapon whereby we bade defiance to the competition of all other nations in the general ocean race then just commenced.—Lindsay's 'Merchant Shipping,' page 358.

"Could we have a stronger confirmation of the fact that it was not the free-ship policy which England inaugurated in 1849 that gave her an advantage over us, but that it was solely the accidental revolution in the ocean carrying-trade which saved her from being distanced more and more by our wooden clipper-ships? We are thus brought to the conclusion that the inception of the decline of our foreign carrying-trade between 1855 and 1861 was due to two causes:

"1. The great change in over-ocean transportation which was gradually being made from wooden vessels to iron, and from sails to steam and the screw-propeller—a change which gave England, with her cheap labor and her mines of coal and iron near the sea-shore, a greater advantage than we had when wood was the only material of which vessels were built.

"2. The adoption in 1854 of the policy of removing every burden from and giving every possible advantage to her merchantmen, coupled with liberal appropriations in the form of postal pay, as well as subsidies, to secure the establishment of steamship lines to all parts of the world; while at the same time the American Government neither lifted a burden nor offered any encouragement to her marine.

"It was not until 1855-'56 that these causes began to exert a marked influence and to change the current of the foreign carrying-

trade. Prof. Sumner agrees substantially with his view, and I may add that even Mr. Wells, in his work on the American merchant marine, concedes that these were the real, substantial, and efficient difficulties which came upon us and changed the current of our foreign carrying-trade.

"So long as wooden sailing-vessels controlled the foreign carrying-trade of the world we had an advantage in the construction of vessels over any other nation in the world. We had the cheaper material, and this superior cheapness of material enabled us to bridge over the difference in labor; for it must be remembered that in the construction of a wooden vessel, as compared with the construction of an iron vessel, the wood or timber when it is out from a tree is further advanced toward the completion of a vessel than is the iron when the ore has been dug from the mines, smelted, and rolled or hammered into bars, angles, and plates. The amount of labor to be put upon the wooden vessel after the tree has been felled is less than one half of the amount of labor that is required to build the iron vessel after the ore is taken from its bed.

"Therefore, Mr. Speaker, so long as we occupied the vantage-ground, possessed when wooden sailing-vessels ruled the sea, no nation could cope with us.

"At that time, also, all our laws relating to our merchant marine were precisely the same, with the same difficulties, with the same discriminations as the English laws. But in 1852, 1853, and 1854 the Parliament of England began the revision of her merchant shipping laws, and removed every burden from her vessels engaged in the foreign trade; while we looked on, too confident in the position we occupied. And there, Mr. Speaker, was the fatal error in the policy of this country. From 1855 to 1861 there was a steady decline year by year, as rapidly as at any time since the war, in our foreign carrying-trade. If the American Congress at that time had come forward and lifted all the burdens, and amended the shipping laws so as to give the same advantages to our vessels as the English Government gave to their vessels, and if in addition to that the American Government had given such generous mail contracts for the establishment of mail steamship lines as the English Government was giving, then we should not have to-day to lament over so humiliating a decadence of American shipping.

"But more than that, Mr. Speaker. In 1861 came the terrible conflict of arms, the civil war, which engrossed the energies and the capital of this country for four long years. Instead of building up our shipping and our resources, we were tearing down; instead of constructing vessels, we were destroying them with powder and shot and shell. But what was England doing all that time? She looked on and laughed at our discomfiture. She let the Alabama sail out of her ports without hin-

drance, and more than one third of all our tonnage engaged in the foreign carrying-trade was swept from the ocean, either by capture, or by sale to avoid capture.

"During this time England was intrenching herself in the position she occupied. She was building up great iron ship-yards, and getting an advantage difficult to overcome.

"If our hands had not been tied during that time, unquestionably we should have adopted some policy that would have met the advances of England in this race on the ocean. But we could do nothing, and when the war closed we saw not only one third of our ships swept from the ocean, but also the iron ship-yards of Great Britain firmly established, and built up, too, by every possible encouragement. We saw dock-yards built from tonnage taxes, exacted in part from American vessels that entered British ports, with all the ingenuity that could possibly be devised, even going so far in order to establish steamship lines that she made contracts with various navigation companies to put on steamship lines, engaging that the Government would secure to the proprietors of the lines 8 per cent. dividend.

"This was the course of England at the time when our hands were tied. And then, when we came out of the war, Mr. Speaker, our hands were again tied—tied because of the indirect results of the war. Bear in mind that we came out of the conflict with a depreciated currency and inflated prices. We came out with speculation raging over the land, and the result was that, with the engrossment of the public mind in the problems of reconstruction, it was practically impossible until the resumption of specie payments, and until the large profits that arose from the opening of the far West and from the building of railroads had passed away, and until the rate of interest on capital came back to the normal figure, and even below—it was impossible, I say, until about the year 1878 or 1879, for us to adopt any efficient measures that could have built up the American foreign carrying-trade.

"It seems to me, Mr. Speaker, that instead of being amazed at the rapid decline of the American foreign carrying-trade under these circumstances, we should almost wonder that it has stood the trial so well.

"Now, Mr. Speaker, having discussed what seems to me to be the causes of the difficulty in which we are placed, I wish to approach next the question of remedies. The foreign carrying-trade, unlike the coastwise trade, and unlike any other business we have in this country, is an unprotected trade. It must be carried on on the highway of the ocean, where competition from all nations meets it on a common platform. No possible device that we can make, no possible legislation that is open to us after our maritime reciprocity treaties have been entered into—for it must be remembered that while formerly there was a 10 per cent. discriminating duty in favor of imports in

American vessels, long ago treaties entered into at a time when wooden sailing-vessels enabled us to control the ocean, have prevented us from making any arrangement or giving any preference to American vessels over vessels of foreign nations.

"Consequently we are in this difficulty in respect to the tonnage-tax. If we abolish the tax as to American vessels, by that very act we abolish it as to foreign vessels. We can not take a single step in the direction of endeavoring to protect our own vessels by direct legislation, without giving the same advantage to the foreign vessels that come into competition with them. While giving every other interest in the country the benefit of the protection of either a high or a low tariff, we compel our vessels engaged in the foreign trade to go out upon the highway of the ocean and meet the open competition of other nations.

"Of course it is too late for us to go back now on the policy of maritime reciprocity, which was adopted in the days when we could control the ocean. We have to devise remedies in spite of these difficulties.

"There are two things that must be done if we are to revive the American foreign carrying-trade. What are they? First, we must by our legislation or otherwise make it possible for a vessel floating the American flag to carry our exports and imports as cheaply as the vessel of any other nation can do. The nation which will do the carrying-trade of the world the most efficiently and cheaply will secure it, and in securing it will control the ocean.

"Then, after we have done that, we must also make it possible for an American ship-owner or would-be ship-owner to obtain vessels for his trade at no higher cost to him than to our foreign competitors. I need not argue those two propositions; they are self-evident. The problem for us to solve, therefore, is how to do these two things.

"First, as to the running of vessels after they are built; for obviously there can be no useful end attained by any policy to secure cheap vessels to American ship-owners or would-be ship-owners unless after they obtain those vessels they can run them as cheaply as our English rivals.

"Now, some one has said—not in the course of this debate, but it has been said—that there was no difficulty in that direction. I wish to say, Mr. Speaker, that the greatest difficulties lie right here. And yet the difficulties are such that they can be not entirely but largely overcome by legislation.

"I wish to cite as proof that there is difficulty here this simple fact: for ten years we have been enabled to build first-class wooden vessels as cheaply as any other nation in the world, quality for quality. In my own State of Maine, and even in the district which I represent, during the last year over 40,000 tons of wooden vessels, the finest ever constructed, were successfully built. To be sure, a large

portion of those vessels were for the coast-wise trade; but some of them were for the foreign trade.

"The fact has developed itself unmistakably that the only reason we do not extend that trade further, that we do not build more wooden vessels for the foreign trade, is that after we have built them we can not run them as cheaply as our foreign competitors.

"Why not? It has been said that the question of wages of seamen is one that meets us here and can not be overcome. I wish to show you, Mr. Speaker and gentlemen, that in the foreign carrying-trade the question of wages, especially as to sailing-vessels, is not one that seriously interferes with us. And why? The American vessel engaged in the foreign carrying-trade a large proportion of the time is in foreign ports, and so has the privilege of engaging her seamen at any port she may visit. It may be that in shipping men at San Francisco and New York there is a slight discrimination—not much, by-the-way—because from the nature of the case, competing upon the ocean on the same platform, wages of seamen have been brought down to a common standard. The difference in price between the wages of seamen in New York and Liverpool is trifling. Practically, with the liberty which a vessel has when it enters a foreign port to ship a new crew, it may be said that so far as sailing-vessels are concerned this is not an element that enters seriously into the question.

"So far as steamships are concerned, which from the very nature of the trade require a permanent crew, there is some difficulty, but not enough to seriously interfere with the extension of our foreign carrying-trade.

"Then, what are the difficulties in the way? I may say to you, Mr. Speaker, that they are largely difficulties which legislation has erected or may remove. I wish to call attention to some of those difficulties, difficulties which this bill, unanimously reported by both the Joint Select Committee on Shipping and the Committee on Commerce, has sought to remove.

"When the committee came to consider the problem of how to build iron vessels under such a condition of facts, there was one principle which they unanimously accepted, and that was that no policy having reference to the supply of iron steamships to revive the American foreign trade would be wise or successful unless it looked to the building, ultimately at least, of iron steamships in our own country. There was no difference of opinion on that point. All said we must look to that result, and that any policy which could not accomplish this would be a fatal one—fatal, first, because all history proves that no commercial state ever maintained its supremacy on the ocean unless it built its own vessels as well as sailed them; and, secondly, because in time of peace no nation could maintain its commercial independence unless it had the facilities within its own grasp and its own control for

shipping its own merchandise. Suppose a war to-day should break out in Europe, and England should engage in conflict with a country able to put cruisers upon the sea—privateers, it may be—when 85 per cent. of the produce of the West is being shipped in foreign, mainly in English vessels—in such an event all the produce of the West shipped in English vessels would be liable to seizure and confiscation by the power engaged in war with Great Britain. Therefore, I say in such a case as that, the American people, and particularly the people of the West, would suffer more than the belligerents themselves.

“Again, thirdly, no policy is wise or safe which contemplates resorting to foreign countries for the purpose of obtaining our ships for our American marine, because no nation can maintain its independence and defend itself in time of war unless it is able to improvise and build its own vessels. Consider for a moment in what situation we should have been placed in 1862 if we had been obliged to send to England to have the little Monitor built for us. What would have become of our ports, of which the gentleman from New York (Mr. Hewitt) spoke so eloquently the other day, if at the breaking out of the war we had been obliged to resort to the nation which tried to crush us? For it must be borne in mind that the mercantile marine is the militia of the sea, occupying the same position on the ocean that the State militia do on the land. No nation ever maintained its power upon the ocean unless it had a commercial marine of its own. Therefore I say to you that it is more than a question of business, more than a question of whether we shall have a part of this carrying-trade. It is a question of whether the nation shall be able to defend itself; it is a question of national security and national independence.

“No policy, therefore, that looks to making this nation dependent upon a foreign nation, upon a nation like England, for the supply of vessels for its merchant marine can be wise or safe.

“This to my mind is the serious objection to the proposition of the gentleman from New York (Mr. Cox) to authorize the purchase and American registration of foreign-built ships. Such a policy can not develop iron-ship building here, for the simple reason that it is impossible for any ship-builder to pay 60 per cent. more for labor here and build ships in close competition with the Clyde. There can be only one way in which our builders could hope to compete on the free-ship basis, and that is by cutting down the wages of our laborers 60 per cent. This is simply impossible.

“Therefore I say that the free-ship plan can not develop iron-ship building in this country. It could do it in Germany, where wages are as low as in England, or lower, but it could not do it in the United States, with our wages for labor. It may as well be said first as last that the free-ship plan would be practically a de-

cision to give up the attempt to build our own vessels.

“That provision of our navigation laws which restricts the right of American registry to vessels built in this country was not the narrow, unstatesmanlike, and unwise legislation which the gentleman from New York represents it to be. It was enacted at the very foundation of the Government, in response to the following suggestion of Washington to Congress:

“We should not overlook the tendency of a war, and even preparations for a war, among the nations most concerned in active commerce with this country to abridge the means and thereby at last enhance the price of transporting its valuable productions to their proper market. I recommend it to your serious reflections how far and in what mode it may be expedient to guard against embarrassments from these contingencies by such encouragement to our own navigation as will render our commerce and agriculture less dependent on foreign nations.—*Washington's Second Annual Address*, December 8, 1790.

“Those laws have stood from that day to this. They have come down to us with the official approval of Washington himself. They come to us with the indorsement of Jefferson, of Adams, of Madison, of Monroe, of all the fathers of the republic. They come to us in this shape because the fathers of the republic said we could not successfully defend ourselves unless we built up a merchant marine constructed in our own country.

“Two lines of policy were considered by the committee, both of which looked to making it feasible to build our ships at home. One policy proposed, and that which I think all the members of the committee would be willing to accept as a complement to the section which has been reported, is to provide that materials advanced to the point of bars, angles, rods, etc., may be imported in bond duty free when they are to be used in the construction of vessels for the foreign trade.

“But the committee were conscious that with a free-material clause standing alone, with 8,000 miles of ocean between us and England, it would not be wise to make us entirely dependent upon England for the materials for the construction of our ships. We believe there should be coupled with a plan of that kind some provision which would enable our builders to use materials produced in this country by American workmen at higher-cost labor.

“The committee recommend the adoption of a section providing for the importation of materials from foreign countries duty free, and another section providing for a drawback, so called, whenever the materials used are of American production, a drawback to the extent of the duty on the foreign material of the same kind. This drawback would practically cover the difference between the cost of building an iron steamship in this country and in England, which is about 30 per cent. This drawback would practically come from the tonnage-tax, which, as I have already said, we

should be willing to abolish if five sixths of it did not fall on foreign vessels.

"The committee believed that we might use this tax in the way of building up our own commercial marine, so as to enable our ship-builders to use American materials, by giving them a drawback to the amount of the duty, at the same time giving builders the privilege of importing materials in bond duty free. We were thus for placing home materials and foreign materials on substantially the same platform, and giving the ship-builder or rather the ship-owner, for the drawback goes to the original owner of a vessel, the choice of American or foreign materials, without discriminating against home materials.

"The committee believed that this provision, without taking any money from the Treasury, which comes from ordinary sources of revenue, and giving the ship-owner the advantage of importing in bond materials duty free from foreign countries, or of using home materials, would be likely to build up iron-ship building in this country, and revive the American foreign carrying-trade. Such was the opinion of the San Francisco Board of Trade, which proposed the plan, and such is the opinion of the New York maritime associations and ship-owners of experience.

"A million and a half of dollars annually comes from the tonnage-tax, and in the next five years the tax will amount in the aggregate to ten millions of dollars. It is a tax five sixths of which is paid by foreign vessels, and which we may properly use to encourage the development of the American merchant marine.

"It is true that the Government of Great Britain, as a government, does not impose what is called a tonnage-tax, but it imposes a light-dues tax, which, as I have said, is really a tonnage-tax. More than this; in the case of a large proportion of the cities of Great Britain having harbors or rivers capable of improvement, the corporation of the city is authorized to impose a tax upon all tonnage that may enter the port, for the purpose of paying the expenses of such river or harbor improvements.

"Take, for instance, the river Clyde, which was originally but a brook, so to speak. The corporation of Glasgow was authorized to deepen and widen the channel of that river and to build docks, with the view of fitting that river to be the center of the iron-ship yard system of the world. The corporation of Glasgow is authorized to impose upon every vessel entering the port a tonnage-tax for the purpose of defraying the expense of improving the river. American vessels entering the Clyde to-day pay to the corporation of Glasgow a tax which is used to defray the expenses of deepening and widening the river and preparing it not only for navigation but also for the iron-ship yard center of the world.

"Gentlemen may say that Great Britain herself has not done this; but the Government

of Great Britain has authorized the corporation of Glasgow to do this work—to widen and deepen the channel of the river and to build dock-yards; the Government of Great Britain has authorized the imposition of a tonnage-tax upon American as well as other vessels entering that port, for the purpose of defraying the expenses of improving that river. Yet gentlemen sometimes tell us that Great Britain has not aided in all these enterprises; that she has let her shipping severely alone, allowing her own local communities even to deepen and widen her rivers. But, in point of fact, Great Britain has authorized her municipal corporations to do what she has not done herself—to collect from the merchant marine of the world a tonnage-tax to pay the expenses of river and harbor improvements. What she has done through her city corporations she has to all intents and purposes done for herself.

"Now, Mr. Speaker, it seems to me wise that Congress, imposing as it does a tonnage-tax which, if circumstances permitted, we should be glad to abolish, should take the amount of this tax and devote it, not to the widening or deepening of any river with the view of building up commerce and furnishing facilities for ship-yards, but indirectly expend it for the purpose of enabling the people of our country to build their own vessels, while at the same time we establish our merchant marine so that we shall not be dependent upon the other nations of the world. It seems to me that this may be done without taking a single dollar of the revenue that may be derived from any of the ordinary sources of taxation. And it may be limited, if you please, to the amount which may be collected from the tonnage-tax, because if the mode of collecting the tax be changed to the English system of a tax on each entry, instead of one million and a half we would have two million dollars and over. Thus we shall imitate the policy of Great Britain in principle, however different may be the application.

"I wish simply to say in conclusion that this is more than a local question. It is not a question of building up a ship-yard here and there. It is not alone a question of building up even a most beneficent industry in our country. It is more than that, it is a national question which reaches every part of this country. The great West is interested in this question if possible more than any other part of the Union, because so large a portion of our exports is produced there. It is indispensable to her that there should be an American merchant marine, not simply to compete with a foreign merchant marine, but an American merchant marine upon which we may rely in time of war. It is more even than that. It is a question of national safety. While Great Britain to-day is doing all she can to develop her iron-ship yards, while she is building 81 per cent. of all her war-vessels and war-engines in private iron and steel-ship yards, why should

we not do something for the encouragement of our merchant marine? It is a matter which concerns the safety of the nation; it concerns our independence; it concerns our national prestige.

"When I was abroad in Europe, going from port to port, I saw so rarely the American flag that it was the source of humiliation to me, for I felt the nation was better known by the flag which floated from the mast-heads of its ships and exerted a greater influence in consequence of that than anything else. We are known abroad by the flag which floats in foreign harbors. Our influence is felt abroad in proportion to the extension of our merchant marine. Our commerce is more or less dependent on it, as well as our independence in peace and our safety in war. I beg of you, gentlemen, therefore, however many differences of opinion there may be as to methods, to be willing to try something, to take a step forward in this matter, for if we go on ten years more in the way we have been going on for twenty-five years past, the American merchant marine and the American flag will have faded from the ocean."

Mr. Springer, of Illinois, argued that there was nothing in the Constitution to authorize the prohibition of State or municipal taxation on vessels engaged in the foreign trade.

In Committee of the Whole, section 11 of the bill as reported was amended by adding a proviso "that this section shall not apply to vessels engaged in the whaling business." An amendment proposed by Mr. Murch, of Maine, by way of substitute, and designed to maintain the practice of paying advance wages to seamen, was rejected. The following further amendment to section 11 was then adopted:

And that all laws or parts of laws requiring the payment of any remuneration to the shipping commissioner for the shipment of seaman, if shipped by said master or owners, be and the same are hereby repealed: *Provided*, That the duties of the shipping commissioner at home ports shall be performed by the collectors of the several ports of the United States, and that no fees shall be charged for such services.

Section 15 was stricken out. Section 16 was amended to read:

That instead of the assessment of forty cents per month upon seamen engaged in the foreign carrying-trade, authorized by sections 4585 and 4587 of the Revised Statutes of the United States, there shall hereafter be assessed and collected twenty cents.

Section 17 was amended to read as follows:

Sec. 17. That the individual liability of a ship-owner shall be limited to the proportion of any or all debts and liabilities that his individual share of the vessel bears to the whole. And the aggregate liabilities of the owners of the vessels on account of the same shall not exceed the value of such vessel: *Provided*, That this provision shall not affect the liability of any owner incurred previous to the passage of this act, nor prevent any claimant from joining all the owners in one action. Nor shall the same apply to wages due to persons employed by said ship-builder.

For section 14 the following substitute was adopted:

That section 2514 of the Revised Statutes be amended so as to read as follows:

That all materials of foreign production, to be manufactured in this country into articles needed for and used in the construction, equipment, repairs, or supplies of American vessels employed or to be employed exclusively in the foreign trade, including the trade between the Atlantic ports and Pacific ports of the United States, may be withdrawn from bonded warehouse free of duty, under such regulations as the Secretary of the Treasury may prescribe; and if the duty shall have been already paid on such materials so used, the same shall be refunded and repaid to the owner or owners of such vessel so using them or their legal representatives.

Section 15 was amended by adding the following provision:

Provided, That nothing in this section shall be construed to repeal section 2793 of the Revised Statutes: *And provided also*, That the aggregate duty imposed under this section in any one year upon any vessel engaged in no other foreign trade than the trade between the United States and the Dominion of Canada or the Republic of Mexico, or any ports or places south of Mexico down to and including Aspinwall and Panama, or any ports or places in the West India Islands, shall not exceed 80 cents per ton.

The following new sections were added to the bill:

Whenever any fine, penalty, forfeiture, exaction, or charge arising under the laws relating to vessels or seamen has been paid under protest to any collector of customs or consular officer, and application has been made within one year from such payment for the refunding or remission of the same, the Secretary of the Treasury, if on investigation he finds such fine, penalty, forfeiture, exaction, or charge was illegally, improperly, or excessively imposed, shall have the power, either before or after the same has been covered into the Treasury, to refund so much of said fine, penalty, forfeiture, exaction, or charge as he may think proper from any moneys in the Treasury not otherwise appropriated.

That section 2966 of the Revised Statutes be amended by striking out the words "propelled in whole or in part by steam"; so that the section as amended shall read as follows:

SECTION 2966. When merchandise shall be imported into any port of the United States from any foreign country in vessels, and it shall appear by the bills of lading that the merchandise so imported is to be delivered immediately after the entry of the vessel, the collector of such port may take possession of such merchandise and deposit the same in bonded warehouse; and when it does not appear by the bills of lading that the merchandise so imported is to be immediately delivered, the collector of the customs may take possession of the same and deposit it in bonded warehouse, at the request of the owner, master, or consignee of the vessel, on three days' notice to such collector after the entry of the vessel.

That section 2872 of the Revised Statutes be amended by adding thereto the following:

When the license to unload between the setting and rising of the sun is granted to a sailing-vessel under this section, a fixed, uniform, and reasonable compensation may be allowed to the inspector or inspectors for service between the setting and rising of the sun, under such regulations as the Secretary of the Treasury may prescribe, to be received by the collector from the master, owner, or consignee of the vessel, and to be paid by him to the inspector or inspectors.

On the adoption of section 18 a vigorous debate occurred, various gentlemen opposing it as creating a subsidy to ship-builders, and others pressing strongly for a substitute in favor of

free ships. Finally, the following substitute was adopted: yeas, 135; nays, 85; not voting, 69:

SECTION 18. When any American vessel shall be constructed, equipped, repaired, refitted, or supplied with ship's stores for the foreign trade, including the trade between the Atlantic and Pacific ports of the United States, in whole or in part, of materials of the production of the United States, the owner or owners of such vessel shall be entitled to receive and collect from the United States a drawback or sum equal in amount to the duty which would have been collected on imported materials of like description and of equal quality with the American materials used in the construction, equipment, engines, boilers, attachments, and other appurtenances of such vessel, including repairs, outfits, and supplies: *Provided*, That in ascertaining such drawback the duty shall be computed on iron and steel advanced in manufacture not beyond the point of plates, angles, bars, and rods: *Provided also*, That such drawback on any article shall not exceed the difference between the market price of such article in the collection district in which the vessel shall be built, repaired, refitted, or supplied, and the market price of a similar article in the city of Glasgow, or the river Clyde, and shall not exceed \$10 per ton admeasurement in the case of the original construction of any sailing-vessel, and \$25 per ton in the case of the original construction of any vessel propelled in whole or in part by steam; and, in the aggregate, the drawback or sum paid under this section shall not in any one year exceed the amount of tonnage-tax collected in such year: *And provided further*, If the fund herein provided in any one year is insufficient to pay in full the amount of claims preferred against it, then it shall be prorated among the claimants and accepted by them in full payment of all claims against the United States arising out of this law: *And provided further*, That this section shall apply only to vessels commenced, repaired, refitted, or supplied after the passage of this act.

That from and after the 1st day of April, 1883, any citizen or citizens of the United States may purchase the whole of any steam or sail vessel constructed mainly of steel or iron, no matter where said vessel may have been built, whether within the United States or in a foreign country, or whether said vessel may have been owned in whole or in part by an alien or aliens; and said vessels shall be registered free of duty as to the hull, spars, appliances, outfit, and equipment (including boilers, engines, and machinery, if a steam-vessel) as a vessel of the United States by the collector in any port of entry of the United States to whom application for such registry may be made by said citizen or citizens, in the same manner as though said vessel had been built in the United States: *Provided, however*, That this section shall apply only to vessels of more than 1,500 tons registry, to be employed in the foreign carrying-trade exclusively, and not in the coastwise trade, excepting between ports on the Atlantic and ports on the Pacific ocean: *Provided*, That all or any part of the materials, whether wood, steel, or iron, copper, yellow metal, bolts, spikes, sheathing, treenails, canvas for sails, whether flax or cotton, rigging and cordage, whether hemp, manila hemp, or iron wire; anchors and cables, iron plates, castings, and forgings, angle-irons, beams, masts, yards, rivets, bolts, nuts, screws, engines, boiler plates and tubes, and machinery, and all other materials and appliances which may be necessary for the construction and equipment, in whole or in part, of vessels to be built and furnished in the United States after the 1st day of April, 1883, for the foreign trade, including the trade between Atlantic and Pacific ports, may be imported in bond under such regulations as the Secretary of the Treasury may prescribe; and upon proof that such materials have been used for such purpose, no duties shall be collected or paid thereon.

Section 22 was stricken out altogether, in deference to the opinion of those who opposed its constitutionality.

Finally, the measure was amended by striking out the eighteenth, nineteenth, and twentieth sections relating to subsidies and free ships, and the machinery for carrying out the subsidy and free-ship provisions. The vote on this radical change was as follows:

YEAS—Anderson, Arnfield, Atherton, Atkins, Barr, Bayne, Berry, Bingham, Bisbee, Blackburn, Bland, Blount, Bowman, Briggs, Brumm, Buchanan, Buck, Julius C. Burrows, Butterworth, Cabell, Caldwell, Campbell, Carlisle, Chase, Clardy, Clark, Clements, Cobb, Converse, Cook, Covington, William R. Cox, Crapo, Cravens, Crowley, Culberson, Cullen, Curtin, George R. Davis, Dawes, Dezendorf, Dingley, Ellis, Ermentrout, Errett, Ford, Forney, Frost, Goddes, Godshalk, Grout, Hall, N. J. Hammond, Harmer, Benj. W. Harris, Haseltine, Haskell, Hatch, Heilman, Herbert, Hill, Hitt, Holman, House, Hubbs, Humphrey, Jacobs, Jadwin, Geo. W. Wise, Benjamin Wood, Young—76.

The bill as amended then passed the House, Jan. 12, 1883. It came up for consideration in the Senate March 3, 1883, and was amended by striking out sections 13, 14, 15, and 22. It then passed that body.

The Fitz-John Porter Case.—The bill for the relief of Fitz-John Porter came up in the Senate

Dec. 28, 1862. It authorized the President to nominate and, by and with the advice and consent of the Senate, to appoint Fitz-John Porter, late a major-general of the United States volunteers and a brevet brigadier-general and colonel of the army, to the position of colonel in the army of the United States, of the same grade and rank held by him at the time of his dismissal from the army by sentence of court-martial promulgated Jan. 27, 1863, and, in his discretion, to place him on the retired-list of the army as of that grade, the retired-list being thereby increased in number to that extent. It was reported by the majority of the Military Committee and was in charge of Mr. Sewell, of New Jersey. Mr. Logan, of Illinois, presented a minority report in opposition to it.

Mr. Sewell of course based his argument on the finding of the advisory board appointed April 12, 1878, by President Hayes, and consisting of Maj.-Gen. J. M. Schofield, Brig.-Gen. Alfred H. Terry, and Col. and brevet Maj.-Gen. George W. Getty. He read many petitions, opinions, and memorials, in favor of the restoration of Fitz-John Porter, and cited the conclusions of the advisory board as follows:

These charges and specifications certainly bear no discernible resemblance to the facts of the case as now established. Yet it has been our duty to carefully compare with these facts the views entertained by the court-martial, as shown in the findings and in the review of the case which was prepared for the information of the President by the Judge-Advocate-General, who had conducted the prosecution, and thus to clearly perceive every error into which the court-martial was led. We trust it is not necessary for us to submit in detail the results of this comparison, and that it will be sufficient for us to point out the fundamental errors, and to say that all the essential facts in every instance stand out in the clear and absolute contrast to those supposed facts upon which Gen. Porter was adjudged guilty.

The fundamental errors upon which the conviction of Gen. Porter depended may be summed up in few words. It was maintained, and apparently established to the satisfaction of the court-martial, that only about one half of the Confederate army was on the field of Manassas on the 29th of August, while Gen. Lee, with the other half, was still beyond the Bull Run Mountains; that Gen. Pope's army, exclusive of Porter's corps, was engaged in a severe and nearly equal contest with the enemy, and only needed the aid of a flank attack which Porter was expected to make to insure the defeat and destruction or capture of the Confederate force in their front under Gen. Jackson; that McDowell and Porter, with their joint forces, Porter's leading, had advanced toward Gainesville, until the head of their column had reached a point near the Warrenton turnpike, where they found a division of Confederate troops, "seventeen regiments," which Buford had counted as they passed through Gainesville, marching along the road across Porter's front, and going toward the field of battle at Groveton; that McDowell ordered Porter to at once attack that column thus moving to join Jackson, or the flank and rear of the line if they had formed in line, while he would take his own troops by the Sudley Springs road and throw them upon the enemy's center near Groveton; that Porter, McDowell having then separated from him, disobeyed that order to attack, allowed that division of the enemy's troops to pass him unmolested, and then fell back and retreated toward Manassas Junction; that Porter then remained in the rear all the afternoon, listening to the sounds of battle and

coolly contemplating a presumed defeat of his comrades on the center and right of the field; that this division of the enemy having passed Porter's column and formed on the right of Jackson's line, near Groveton, an order was sent to Porter to attack the right flank or rear of the enemy's line, upon which his own line of march must bring him, but that he had willfully disobeyed, and made no attempt to execute that order; that in this way was lost the opportunity to destroy Jackson's detached force before the other wing of Gen. Lee's army could join it, and that this junction having been effected during the night of the 29th, the defeat of Gen. Pope's army on the 30th thus resulted from Gen. Porter's neglect and disobedience.

Now, in contrast to these fundamental errors the following all-important facts are fully established:

As Porter was advancing toward Gainesville, and while yet nearly four miles from that place and more than two miles from the nearest point of the Warrenton turnpike, he met the right wing of the Confederate army, 25,000 strong, which had arrived on the field that morning and was already in line of battle. Not being at that moment quite fully informed of the enemy's movements, and being then under orders from Pope to push rapidly toward Gainesville, Porter was pressing forward to attack the enemy in his front, when McDowell arrived on the field with later information of the enemy, and later and very different orders from Pope, assumed the command, and arrested Porter's advance. This later information left no room for doubt that the main body of Lee's army was already on the field and far in advance of Pope's army in preparation for battle. Gen. McDowell promptly decided not to attempt to go farther to the front, but to deploy his column so as to form line in connection with Gen. Pope's right wing, which was then engaged with Jackson. To do this Gen. McDowell separated his corps entirely from Gen. Porter's, and thus relinquished the command and all right to the command of Porter's corps. McDowell did not give Porter any order to attack, nor did he give him any order whatever to govern his action after their separation.

It does not appear from the testimony that he conveyed to Gen. Porter in any way the erroneous view of the military situation which was afterward maintained before court-martial, nor that he suggested to Gen. Porter any expectation that he would make an attack. On the contrary, the testimony of all the witnesses as to what was actually said and done, the information which McDowell and Porter then had respecting the enemy, and the movement which McDowell decided to make, and did make, with his own troops, prove conclusively that there was left no room for doubt in Porter's mind that his duty was to stand on the defensive, and hold his position until McDowell's movement could be completed. It would have indicated a great error of military judgment to have done or ordered the contrary, in the situation as then fully known to both McDowell and Porter.

Gen. Pope appears, from his orders and from his testimony, to have been at that time wholly ignorant of the true situation. He had disapproved of the sending of Ricketts to Thoroughfare Gap, to meet Longstreet on the 28th, believing that the main body of Lee's army could not reach the field of Manassas before the night of the 30th. Hence he sent the order to Porter, dated 4.30 p. m., to attack Jackson's right flank or rear. Fortunately, that order did not reach Porter until about sunset, too late for any attack to be made. Any attack which Porter could have made at any time that afternoon must necessarily have been fruitless of any good result.

Porter's faithful, subordinate, and intelligent conduct that afternoon saved the Union army from the defeat which would otherwise have resulted that day from the enemy's more speedy concentration. The only seriously critical period of that campaign—namely, between 11 a. m. and sunset of August 29th—was thus safely passed. Porter had understood and appreciated the military situation, and, so far as he had

acted upon his own judgment, his action had been wise and judicious. For the disaster of the succeeding day he was in no degree responsible. *Whoever else may have been responsible, it did not flow from any action or inaction of his.*

The judgment of the court-martial upon Gen. Porter's conduct was evidently based upon greatly erroneous impressions, not only respecting what that conduct really was, and the orders under which he was acting, but also respecting all the circumstances under which he acted. Especially was this true in respect to the character of the battle of the 29th of August. That battle consisted of a number of sharp and gallant combats between small portions of the opposing forces. Those combats were of short duration, and were separated by long intervals of simple skirmishing and artillery duels. Until after six o'clock only a small part of the troops on either side were engaged at any time during the afternoon. Then, about sunset, one additional division on each side was engaged near Groveton. The musketry of that last contest, and the yells of the Confederate troops about dark, were distinctly heard by the officers of Porter's corps; but at no other time during all that afternoon was the volume of musketry such that it could be heard at the position of Porter's troops. No sound but that of artillery was heard by them during all those hours when Porter was understood by the court-martial to have been listening to the sounds of a furious battle raging immediately to his right. And those sounds of artillery were by no means such as to indicate a general battle.

The reports of the 29th and those of the 30th of August have somehow been strangely confounded with each other. Even the Confederate reports have, since the termination of the war, been similarly misconstrued. Those of the 30th have been misquoted as referring to the 29th, thus to prove that a furious battle was going on, while Porter was comparatively inactive on the 29th. The fierce and gallant struggle of his own troops on the 30th has thus been used to sustain the original error under which he was condemned. Gen. Porter was in effect condemned for not having taken any part in his own battle. Such was the error upon which Gen. Porter was pronounced guilty of the most shameful crime known among soldiers. *We believe not one among all the gallant soldiers on that bloody field was less deserving of such condemnation than he.*

Mr. Sewell added: "I am interested in this case of Fitz-John Porter, because I served in the Army of the Potomac during the entire period he was connected with it from its formation, and because I know the man and his reputation as a soldier.

"General Porter entered West Point, and graduated high in his class in 1845. He was assigned to duty as second lieutenant of the Fourth Artillery, in which regiment he served in the war with Mexico, taking part in the battles of Cerro Gordo, Contreras, Molino del Rey, the sieges of Vera Cruz and Chapultepec, and in the capture of the city of Mexico, in which struggle he was wounded at the Garita of Belin. For his services in these battles he was twice brevetted. In 1857 we find him serving on the staff of Gen. Johnson as chief of staff.

"At the breaking out of the late war Gen. Porter, upon his return from Texas with the remnant of troops stationed there, was assigned to duty in Pennsylvania with the general charge of keeping the roads open to the capital at a critical period of our history, which duty was performed to the satisfaction of the

Government. While at Harrisburg he was instrumental in organizing and forwarding troops for the protection of the capital; and learning through Gov. Curtin that the arsenal and other public property at St. Louis was liable to fall into the hands of the secessionists of Missouri, and being cut off from telegraphic communication with Washington, he assumed the responsibility and telegraphed in the name of the Secretary of War to muster in the Missouri volunteers, under the command of Capt. Lyon, for the protection of public property.

"Mr. President, it required not only a good soldier, but a strong man, to assume such responsibilities. It was not the act of one lukewarm in the service of his country. His action was warmly approved by Gen. Scott and the Secretary of War on his reporting the case. Gen. Porter's next service was as chief of staff with Gen. Patterson, after which, upon the organization of the Army of the Potomac, he was assigned to the command of a division, and had charge of the siege of Yorktown until it fell, when he was placed in command of the Fifth Army Corps, with which he fought the battles of New Bridge, Hanover Court-House, Gaines's Mills, Turkey Bridge, and Malvern. For his services in this campaign he was promoted major-general of volunteers and brevet brigadier-general in the regular army. Upon the abandonment of the Peninsula by the Army of the Potomac, Gen. Porter reported to Gen. Pope at Bealeton, Aug. 26, 1862. The charges and specifications under which he was tried refer to the period between this date named and the 31st of August.

"I have endeavored, in answer to the minority report presented by the honorable Senator from Illinois (whom I had hoped would be by this time, as was another great soldier, convinced by a study of the case), to show the innocence of Gen. Porter.

"Personally, Mr. President, I believe, as was reported by the board, that Gen. Porter did his whole duty on the occasion referred to, and particularly in connection with the order to move his command at one o'clock, and what is known as the 'four-thirty order.' I will say more. From my knowledge of the man as a soldier and a gentleman I do not believe it possible that he could be guilty of directly or indirectly contributing to the defeat of his comrades in arms by the non-performance of his duties as he understood them.

"The reputation of Gen. Porter in the army was that when he had a company it was the best in the battalion; when he commanded a regiment it was the best in the brigade; when commanding a brigade it was the best in the division; and his corps, the fifth, was the pride of the Army of the Potomac. This man, whom the records show as I have quoted them, pushed the movements of his corps from the Peninsula in order to sustain Pope, making the junction four days sooner than his orders would have required. This does not bear on the face of it

any probability that, having pushed his command ahead of time, he would fail within the next few hours to give that prompt succor to the army of Gen. Pope which he had been making forced marches to accomplish.

"No, Mr. President, these things are inconsistent. Fitz-John Porter was sacrificed to a public sentiment which at that time required somebody should suffer, that somebody should be made an example of for the mismanagement of military affairs.

"He comes now before the only tribunal which can give him justice, after twenty years of suffering under what he believes, under what I believe, and what a large portion of the American people believe to be an unjust sentence. Gen. Porter only asks that he may be restored to that army in which he served so faithfully, and in which he was one of its brightest ornaments."

In conclusion, he made an article of Gen. Grant's in the "North American Review" for December, 1862, a part of his argument.

Mr. Logan, of Illinois, spoke for several days against the bill. He began by making a letter of his own in reply to Gen. Grant's article a part of the record. Touching the alleged disobedience of the order to march on the night of Aug. 27, 1862, he said: "The Senator who votes that, Fitz-John Porter was not convicted properly and legally, votes that he obeyed that order or that it was impossible to obey it; any one who votes to relieve this man from the sentence of that court-martial votes in the face of all the testimony that was given even by his own friends, and votes that the court-martial found him guilty when he ought to have been found not guilty, when in fact the evidence shows that he never attempted to obey the order. The law says that he must obey it, that he subjects himself to the death-penalty if he does not obey; and yet he did not obey it, he did not try to obey it. He violated the law and violated the order; and yet, forsooth, you say he is not guilty! Well, if gentlemen can do that, it is for them to say and not for me; but that is the fact, and there is the law. Under the law and the evidence the judgment of that court-martial was as righteous a judgment as ever was given. It was just, it was right, because it was in accordance with the law and in accordance with the evidence.

"If commanders of divisions and corps are to be permitted to be judges for themselves as to whether they will obey an order or not, then I would not give a straw for all the armies of the United States. If a corps commander may say an order need not be obeyed, why can not his brigade commander or division commander say the same, and why can not their colonels and their captains say the same? What kind of an army would you have if you gentlemen were all division commanders or corps commanders and were off some miles, the enemy was approaching, and the commanding general should send orders to each one of you to concentrate at day-

light to-morrow morning, for the reason that he expected either to make an attack or to be attacked, and each man should say, 'Well, it is too dark; I will not go until to-morrow morning,' and no one of you started? If one of you may disobey an order, all may. Suppose no one starts, and the general is left there with a small force to fight the next morning, nobody to come to his rescue, nobody to obey his orders, what kind of an army would you have?

"Oh, but some gentlemen say one of the great chiefs of the world has said he could not move because the road was obstructed; therefore we must give a judgment that he could not. I should like to put some of the sworn statements of that chief against his published statements which are not sworn to.

"Take the history of the world from the time we have had wars, and you can not find such an excuse as is given here by Fitz-John Porter for not moving, that there were wagons in the road. I could give instance after instance where marches were made after night, where marches were made in rain-storms, where battles were fought after night, and I could recite numbers of instances where armies moved and corps moved without orders to the sound of battle, if it were necessary, but I will not give the instance for reasons that will be well understood.

"One of the greatest battles fought during the whole campaign called the Atlanta campaign was fought without one single order being given by the commanding general; but they were not Fitz-John Porters who commanded the corps there. The general in his report of that battle said that all of his orders were anticipated. That battle was fought from early dawn until nine o'clock at night without orders from the general commanding the army, and it was successfully fought. They took the maxim of Napoleon, 'March to the sound of the enemy's guns,' and that was why Napoleon always had his army on the field first, because that was a standing order. His corps commanders marched to the sound of the enemy's guns, and hence the army was always concentrated before the army of the enemy.

"Wherever successful battles have been fought in history they have been fought by officers knowing their duties and performing them without waiting for orders. Why, sir, I could cite instances—I did in my remarks before, and I do not wish to repeat now what I said then—instance after instance where marches were made at the dead hour of the night, when the clouds were lowering and no moon and no stars giving light. Here is a man who sits before me (Mr. Miller, of California) who marched one night ten miles, when it was raining, with 6,000 men to oppose 60,000, and to hold them there until the General of the Army could take his position and get ready to fight. And yet this man Porter would not move for fear he would be drowned in a mud-hole!"

Touching the alleged failure of Porter to obey what is known as the joint order of McDowell and Pope of Aug. 29, 1862, and what is known as the 4.80 order of the same day, Mr. Logan took new ground. He did not maintain that Porter could, as Pope imagined, attack Jackson's left before the arrival of Longstreet, but he maintained that it was his duty to obey orders at all hazards, and that if he had done so his attack, even if his corps were sacrificed, might have given the Union army as a whole the victory. He said:

"On the 29th of August, 1862, as shown by the almanac, the sun set at 6.36 p. m. If it was sundown no sooner than 6.36, there is not a man in the Senate-chamber but what knows, unless it was a rainy night or a very cloudy night, or something of that kind, that it was daylight I might say almost up to eight o'clock. There was nothing in the world in the month of August at that time, when the sun set at 6.36, to prevent the movement of troops for two hours later than the time he claims he received this order. If he could not have done any better he might have sent part of his command. If he had even lost a part, if they had been captured, it would have been carrying out the order to some extent, it would have been showing his desire at least to feel the enemy; but he did not even do that. The only order he gave after receiving this order was to put his troops in position at once to attack, and the very moment the order was given, before the two regiments were put in position, he gave an order for them to come back and go into camp for the night.

"That was the manner in which he obeyed the order; and yet we are told that he did not disobey this order; that he did not violate the order; that he ought to be excused; that he was wrongfully convicted; that Mr. Lincoln did wrong in signing the warrant to convict him; that Garfield did wrong on the court-martial to convict him; that everybody has been wrong ever since except the few people who lately have got very sentimental and begin to talk about time, about twenty years having passed. True, twenty years have passed, and if it was left to me one hundred and twenty years would pass before ever I would reverse a court-martial that had the facts before them as that one did that excited the country in reference to the wrongs that this man had perpetrated upon our army.

"Mr. President, there is one thing that I desire to mention to the Senate. The military law, in order to have an efficient army, must be, in the first place, a stringent law, and, in the second place, it must be rigidly enforced and executed. The articles of war that exist in this country to-day are similar to the articles of war in countries where the best armies exist. These articles of war are based on those of ancient Rome, where the best army the world has ever seen was organized.

"The only theory of an army is that when

organized it must be composed of men who make that their profession, so that when they go into the army they go with their lives in their hands; they must go without regard to whether they will be killed or die with yellow fever or anything else. They must go into the army with the understanding that they will go wherever they are ordered. If they are ordered down on the border of Texas when the yellow fever is raging, and there is a necessity for their going there to protect the borders, they must go; that is the rule. If it was left to them, of course they would not go; and the border might be overrun.

"So the rule is that an order must be obeyed. It is not a question as to whether the man who obeys the order shall die, be shot, shall never return home again, but the question for him is, 'How can I obey the order? How am I to do it?' The only way to do it is to try to do it. If it is a lawful order he is bound, at least, to attempt to obey it. So it was in reference to these orders. If this man on the night of the 27th had taken his troops at one o'clock and moved them for the six miles when there was nothing on the road, and could not have gotten any farther, and it was impossible for him to pass any farther, that would have been an excuse to his commanding officer that he tried to obey it, that he started at one o'clock; but he did not do it. Hence he did not try to obey the order, he treated the order as a dead letter. So as to the joint order and the 4.80 order, instructing him to push forward in the direction of Gainesville, and also to attack. If he had gone forward, if he had moved forward until he struck the enemy, had fired into the enemy, and found them too heavy for him, and had to fall back, then there might have been an excuse for it. He could have said, 'I tried, but my force was not heavy enough.'

"If he had fought and been whipped, and come back and said, 'I am whipped; I had to surrender, or I had to retreat,' that would have been all right; but the idea that a man shall come back and say, 'I did not attack because if I had I would have been whipped,' is preposterous. No soldier that is fit to command an army will ever make any such excuse. If you allow this to be an excuse for disobedience of orders, you may organize your army just as soon as you choose; you may organize 50,000 or 100,000 men and send them down on the border of Mexico, if we should be in trouble with our sister republic—God knows I hope we never shall be—but if it should be in the sickly season, and you order that army down there with this man excused, with this man restored to the army, having disobeyed these orders, every man who chooses to say so says, 'I will not go; I will not go because the yellow fever is an obstruction'—why is it an obstruction?—'I shall die; I will not obey the order.' You go before a court-martial, and they say the order should be obeyed; and you go before Congress and say, 'I could not obey

because the yellow fever was so bad; if I had gone there I would have died.'

"Within a few weeks the Secretary of the Navy ordered the trial by court-martial of a naval officer for leaving his post during the prevalence of yellow fever. The court sentenced him to be dismissed the service, and the President approved the sentence. Is he to be restored on this principle? Why not, if Porter is?"

"Fitz-John Porter says, in substance: 'If I had gone in there they would have eaten me up; they would have whipped me; I would have been killed, and many of my troops, and therefore I did not go.' Is not the other equally as good an excuse? Suppose you send an army down on the frontier. They undertake to cross the river and go into our sister republic on account of war. An officer says: 'I can not cross that river, because the enemy has over there 25,000 men; I am not able to contend with those 25,000; therefore I can not cross the river; if I do I shall be whipped.' Suppose Gen. Zachary Taylor, with his 6,000 men at the battle of Buena Vista, when 20,000 Mexican soldiers, armed and equipped, appeared on the hill-side to assault him—suppose he had said, 'I can not fight them; they are too strong a force'?"

"But Zachary Taylor fought them with 6,000 men, and he whipped them. So with Scott, when the city of Mexico surrendered to him, with the few troops that he had there that morning. One or two Senators who are here present now were there that morning and know that that surrender was made to Scott when he only had a handful of men present. We might go on through history from time out of mind almost to the present day and show that if this had been an excuse wars would not have amounted to anything, but, as once said, would have been a 'failure.'

"Mr. President, I have a summing up of this evidence and much more evidence that I have already prepared which I want to put into my remarks bearing on these points, but I will not take the time of the Senate to read it. I am not strong enough to-day after being so unwell as I was last night to continue much longer; hence I shall pass by this portion of my remarks and incorporate the summary in the 'Record,' if there is no objection to it.

"In conclusion, I want to ask Senators on both sides of this chamber, and I want some one to tell me, why it is that when this case comes up it seems to be decided on political grounds. What is there in this case of politics? It is a mere question as to whether this man was properly convicted or improperly convicted. It is not a question that politics should enter into at all. It is the case of a man who was convicted during the war, while a great many of you gentlemen were down South organizing your courts-martial and trying your own officers if they misbehaved. You tried them according to the laws which you consid-

ered ruled and governed your army at that time. We tried ours on our side according to the rules which governed our army at that time and govern it now.

"Is it possible that history is going to record the fact that with this man as guilty as he was of violating the orders sent to him, each and every one, upon which he was convicted, that our friends, because they differ with us in politics, because this man is of the politics they are, are going to decide without reference to the facts or without reference to the law that the judgment of this court-martial should be reconsidered, set aside, and this man put back in the army? There is no other ground on which you can do it. It is a prejudice against the court, against the parties at the time, and nothing else. I hope that does not exist; I hope that will not exist any longer; it should not.

"I do not think it comes with the best grace for men who tried their own disobedient officers in their own way to use their power and influence to restore officers whom we dismissed from our service in the army in order to disgrace the courts which convicted them and the President who signed the warrants. I do not think it is policy for men to come here and undertake to reverse that which was done according to fact and according to law. Let those men who were derelict in duty on our side, whom we dealt with, go. They are of no service to you and none to us. They are of no more service to the country. They may serve themselves, but no one else.

"I should like to know the difference between restoring this man to the army to-day and restoring any other man in the United States. If you were asked to restore some men it would cause a good deal of feeling perhaps, because they were dismissed from the service peremptorily. This man was dismissed from the service lawfully and properly. More than that, the precedent which you establish in opening courts-martial after twenty years is a very dangerous one. It is a bad precedent, one that will live to trouble those who establish it.

"Some say, Why not restore this man on the ground of mercy? Mercy does not apply to this case. Mercy applies to that which has been done, that is, to the pardoning of this man and relieving him from the sentence which was inflicted upon him which prevented him from holding an office. That has been done as an act of mercy. This is not an act of mercy. This is an act declaring the law different from what it is, declaring the evidence different from what it was, and declaring the court finding and the law and the evidence wrong. It is an act and declaration on the part of the Congress of the United States as a court reversing the decision of a former court.

"Mr. President, I protest most seriously against the establishment of this precedent. I protest most earnestly against the establish-

ment of this precedent on lines which have attempted to be drawn heretofore. I protest against the establishment of this precedent because in my judgment it is a reversal of the law as it existed at the time, of the evidence, of the facts as they really were at the time of the finding of the court and as they are to-day. I protest against it further because it is a disorganizing and disrupting influence that will enter into the army of the United States, which army is for your protection as well as for mine.

"The armies that are now to be used are not against you or against me, but in favor of our country, in favor of the one common Government under which we all live; and in fact to-day we should all take pride in the army, small as it is, and try to make it efficient; try to make it a grand army; try to make it a brave, a generous, a bold, and a fearless army. We can not do that by relieving unworthy men from embarrassment, and putting them back in the army along by the side of men who fought and won their spurs.

"Mr. President, this can not be done without, as I said, carrying with it an influence that will be detrimental in its effects upon the Army of the United States. And, sir, let me say to our Republican friends on this side of the chamber, it is but a recent thing that so many lawyers have flocked around the city of Washington for the purpose of engineering a case of this kind; it is but a recent thing that so many men have been brought into play for the purpose of forcing this upon Congress. It is unusual in all its bearings and in all its aspects; it is unusual in the influence that has been worked up and attempted to be brought to bear; it is unusual in the circumstances which now surround us.

"With the views I entertain concerning this case, believing as I do that this man disobeyed lawful orders, that he disobeyed those orders with a view of destroying Gen. Pope; that he disobeyed those orders without reference to the effect it would have upon the people of the United States; that he did it for the purpose of having Pope relieved and some one else put in his place who would be more congenial to him (Porter)—believing as I do that this man out of his prejudice against McDowell urged Patterson not to fight Johnston, which lost the first battle of Bull Run; that he refused to obey the first order he received from Pope to move to the field, refused to obey both orders that he received to push forward and attack—believing all these facts to be completely proved by the evidence, and knowing the law to be what it is, authorizing the court to inflict the penalty of death, and when they inflicted the milder penalty—believing that they let this man off with a much less penalty than would have been adjudged had he been tried by a court-martial in any foreign country—with all these facts before me, with the knowledge I had of the generosity of President Lincoln, with the

knowledge I had of the big-heartedness of Gen. Garfield, with the knowledge I had of Gen. Hunter, with the knowledge I had of the other officers who sat upon that court-martial, before I would give a vote to restore this man to the army and let him live the balance of his days on the bounty of the tax-payers of this country, I would go across the Potomac river and kneel down by that tomb on which is inscribed 'Here sleep the unknown dead'; I would go among those little white headstones that mark the place where those boys sleep who fell on the battle-field of Groveton on the 29th of August, and I would there in the presence of those whitening bones on my knees pray to Almighty God to forgive me for the wrong that I am about to do to the dead who have gone, and the wrong I am about to inflict on this country, on the law, and on the facts, by the restoration of this man to his place as an officer of the army. Sir, I would stand in the rays of the majestic king of day and appeal to the sainted spirit of Abraham Lincoln, who has gone before us, and say, 'Inasmuch as in examining this case you thought this man was guilty and signed the order, and when he appealed to you again on the re-examination of this case you declined to take any action in it, before giving this vote for his restoration to the army I appeal to you to take my hand and help me through this trouble and forgive me for perpetrating the wrong against your good name.'

Mr. McPherson, of New Jersey, in defense of Porter, said:

"Mr. President, this is not a new question in the Senate. It is old as my term here, and is likely to outlive me.

"It has been forcibly and ably discussed by Senators from my State and by many other Senators who have made it a special study. I would not now rise to add a single word to what has been so well said by my colleague, except to protest against the seeming desire on the part of some Senators to withhold longer from Gen. Porter that measure of relief so long denied, and to which he is so justly entitled.

"Gen. Porter, a distinguished, capable, and we believe faithful soldier in the Army of the United States, who had fought many battles for his country, not one against her, had been tried and condemned as a traitor. It is pleasant to recount the triumphs of a long and brilliant service as it is painful to follow the unhallowed steps which led to his disgrace and utter defeat.

"To a proud and manly spirit, conscious of no wrong, how bitter must have been the disappointment, and how doubly keen the shaft which pierced his heart when the fatal cruel words were spoken which sent him forth in disgrace from the army he had served branded with infamy!

"I need not speak of the spirit of jealousy and envy, of political and personal hatreds and

animosity, which characterized the period at which Gen. Porter was required to confront his accusers at the bar of military justice.

"Nor need I speak that other word, *incapacity*, which never fails to reach for a victim to shield it from public contempt and indignation. To say that Gen. Porter suffered all this is but recounting the truths of history.

"Nearly twenty years have come and gone, long and weary years to Gen. Porter and his beloved family, since his brother officers pronounced upon him that terrible doom which has grown darker with time. During all this time Gen. Porter has stood at the doors of the temple consecrated to justice asking, not for mercy, only for justice, and it has been denied. What was his as a right has been denied him even as a privilege.

"But, thank Heaven, new light is slowly but surely breaking over the dark and dismal sea he has been forced to sail. Boards of military officers, not supposed to be his friends, of high renown, have so far as they lawfully could reversed the unjust judgment and turned the calcium light upon the workings of the past. Gen. Grant, distinguished alike for his ability and courage in war and the gallantry of his heart and mind in peace (to his everlasting honor be it said), bears living witness to the justice of his cause.

"One by one the plague-spots which reddened the horizon of his military glory are fading away, and Gen. Porter stands to-day robed in white, without stain, even in the eyes of those who had been his bitterest accusers.

"But this is not enough. The records of this country, in whose cause he fought and by whose fault he suffered, if not corrected, will hand down to his children's children and their children for all time the deep damnation of their fathers' shame. His country itself struck the cruel blow. Congress alone can heal the wound.

"Is there a man here whose conscience does not tell him, with the weight of testimony we hear, that there are not at least sufficient facts to cover this case with the mantle of a doubt? Is there a jurist here who has not charged from the bench time and time over that to doubt was to acquit? Is there a lawyer here who has not in thunder-tones demanded for his client, as a right recognized and respected the world over, the benefit of a doubt? Is there a Senator here who has followed in his mind's eye the career of Gen. Porter from camp to camp, from battle-field to battle-field, on the long and toilsome march by day and by night, who in his heart believes he was guilty of treason? If not, and the proofs seem to be wanting, it is your duty to pass this bill.

"I have not the physical health nor indeed the inclination to follow the Senator from Illinois in his wanderings after testimony upon which with his construction he might justify his vote against this bill. We leave the conclusions of the Senator from Illinois side by

side with the conclusions of the advisory board, made up as it was of three distinguished officers of the army, some of whom at the outset of the investigation believed in his guilt, and who could not be convinced to the contrary without the strongest evidence. With all the facts, new and old, before it this board reported unanimously in his favor, and have forever settled the question of Gen. Porter's innocence in the hearts and convictions of the people of this country. Let now this Senate do its plain, simple duty, and undo this wrong, so far as it is possible to do it, by passing this bill."

Mr. Hawley, of Connecticut, said: "Mr. President, I am not going to speak upon this bill. I intend to vote in accordance with the views presented by the Senator from Illinois (Mr. Logan). I am convinced that I ought to do so. I never have had any hesitation as to which was the right way to vote, so far as I am concerned, except for a time after the Schofield board made its report. I am personally acquainted with a member of that board. I am long and intimately acquainted with Gen. Alfred H. Terry. I have known him well for more than twenty-five years. I served with him or near him during the whole war; and I only rise to express my deprecation of an intimation made by my honorable friend the Senator from Illinois, an implication that the board might possibly have been influenced by improper motives; that the questions likely to arise concerning promotion might have had something to do with their judgment. It should be put upon record, I think—at least I take leave to do so—that my friend Gen. Terry earnestly begged to be excused from that board. He told the Secretary of War that his judgment was made up; that he was against Porter; that he thought Porter was rightfully convicted, and that he was not the man to go upon that board. They still insisted, and he went there with that prepossession. If there be an honorable man in the world it is Gen. Terry, and that he came out of that board with the recommendation he did was the only thing that ever staggered my judgment in the case. I have recovered from that; I am obliged to differ with some of the dearest friends I have in the world, whose motives I can not for a moment question, but I am equally sure that I am right; and that is the misfortune."

Mr. Cameron, of Pennsylvania, said: "Mr. President, it is not my habit to give explanations for votes that I cast, nor is it my intention now to depart from that rule, for it makes but little difference how plausible are the arguments which may be given on any subject; it is the vote itself or its result which counts.

"My object in now rising is to speak of my personal knowledge of Gen. Porter's connection with the war in its early history. I believe that I can state a few facts which came under my own observation which will go far, very far, to show that he, at the darkest moment of our great struggle, proved himself

as patriotic as any man in the history of the nation.

"Fitz-John Porter, in April, 1861, then a major on the staff of Gen. Scott, was sent by the War Department to Harrisburg, Pa., to aid the State authorities in organizing and forwarding the troops of that State to the seat of war at Washington. He had not been in the State forty-eight hours before communication by mail and telegraph was cut off between the two cities, and he was left to act upon his own responsibility. He was equal to the emergency. Not only did he perform the duties to which he had been assigned in Pennsylvania with great zeal, tact, industry, and wonderful vigilance, as will be and has been testified to by the then State authorities, who were themselves without any military experience, but, knowing the utterly helpless condition of the authorities at Washington, he assumed authority in the name of the commanding general, and directed the movements of troops from other States—particularly the troops from the State of Ohio—who were *en route* to Washington and passing through Pennsylvania. He never seemed to eat or to sleep, but was eternally on the alert, cheering the men by his zeal and his confidence, aiding the authorities by advice, and instructing them how to bring order out of chaos.

"It became my duty to take charge of the railroad from Harrisburg to Baltimore, and while so engaged an incident occurred in my office which impressed me greatly at the time, and which, it has always seemed to me, should atone to a great extent for any errors Gen. Porter may have committed, if any, at a later period of the war. It was to a great extent through him, in my judgment, that the services of Gen. George H. Thomas were secured to the side of the Union.

"Gen. Thomas, then Major Thomas, was stationed at Carlisle Barracks; there were at the same time two other majors of the army stationed at the same place, I have forgotten their names (but that is immaterial, for the records of the War Department will show), when an order was received from the War Department by a messenger who came across the country, directing Major Porter to send the troops then at Carlisle to Washington, with directions to have them cut their way through. It is the language of this order which makes me say that this was at one of the darkest periods of the war. The capital of the nation was menaced by an enemy camping within a few miles of it, and had but a handful of men for its protection.

"Porter, with a quick perception of the gravity of the situation, and showing a thorough knowledge of the fitness of the man for the duty to be performed, selected Thomas from the three majors, and ordered him to report to him at my office in Harrisburg, that being Porter's headquarters. Thomas arrived there promptly the same evening. When in-

formed of the duty to be performed, Thomas hesitated, and then began a conversation between the two officers which continued until morning, and made a lasting impression on my mind. Thomas argued against the war, taking the ground that the trouble had been brought upon the country by the abolitionists of the North, and that while deploring it as sincerely as any man could, the South had just cause for complaint; Porter took the position that he, Thomas, as a soldier had no right to look at the cause of the trouble, but as an officer of the United States army it was his duty to defend his flag whenever it was attacked, whether by foes from without or from within. Porter pleaded as zealously, as eloquently, as I have ever heard any man plead a cause in which his whole heart was engaged, and it was this pleading which caused Thomas to arrive at a decision.

"I do not say that Thomas refused to obey his orders, but I do say that he hesitated and would much have preferred that the duty had devolved upon another. Thomas was a Virginian, and had, as many other good and patriotic men, great doubts as to the advisability of the Government coercing the States back into the Union that had by their Legislatures formally withdrawn, but having that night decided to remain with the Union, from that time forward there was no doubt, no hesitancy, no wavering, but an earnest, hearty support to the side which had for its motto the maintenance of the Union, and to-day his name is among the brightest, best, and purest of its military heroes. If Fitz-John Porter was to any extent instrumental in saving this great name to our list of military heroes, I ask should not this country be grateful to him? I think it should.

"As to Fitz-John Porter's action at the second battle of Bull Run, for which he was tried, I confess my inability to judge. Able military men differ, both sides, in my belief, being equally sincere in their convictions, and both sides being anxious to do Porter justice and justice only, as they view his acts. That there is a prejudice against Porter in the minds of many good people I know, and an instance which came under my notice within the last few days will fully illustrate it.

"I received a letter from a very worthy and intelligent gentleman residing in Harrisburg, in which he states that he has been reliably informed that at the time Mr. Lincoln passed through Harrisburg, in February, 1861, Fitz-John Porter was with him, and when it was determined that Mr. Lincoln would go *via* Philadelphia by night instead of by day, direct through Baltimore, that Porter protested most violently; and then the writer propounded the question, 'Did not Porter know of the mob which was waiting to meet him on his arrival?' I replied to his letter as follows:

"I am in receipt of your letter of the 4th instant and note what you say in reference to Fitz-John Porter's opposition to President Lincoln's route to Wash-

ington *via* Philadelphia in 1861. You are mistaken as to that. Fitz-John Porter was not in Harrisburg at that time, nor did he reach there until after the President's proclamation calling for 75,000 troops in April, 1861. The officers who were detailed to accompany the President were Gen. Sumner, then Col. Sumner, and Gen. John Pope, then Capt. Pope. What their views were with regard to Mr. Lincoln's change of route I do not recollect, but certainly Fitz-John Porter was not in Harrisburg at that time nor was he until six weeks after.

"I believe Fitz-John Porter to have been a loyal soldier of the Union, and whatever mistakes he committed were of the head and not of the heart; and therefore in justice to him I make this statement."

Mr. Lapham, of New York, said: "Mr. President, I desire to detain the Senate for but a very few moments before the vote is taken on this measure.

"The decision of the court-martial which pronounced Col. Porter guilty was made on the 10th of January, 1868. On the 21st of that month it received the approval of President Lincoln. That court-martial, which is admitted to have been a legally constituted body, composed of able men, was in session a period of forty-five days. They sat here in the city of Washington, almost in sight of the scenes of the transactions which constituted the basis of the charges against Col. Porter. They had all the facilities possible to ascertain the exact condition of affairs, and they had the recollection of men fresh from the scene of action. That judgment stands unreversed, and under the law irreversible. So far as it has been executed, it is beyond recall by any power on earth; so far as it is unexecuted, the President of the United States, on the application of Gen. Porter, has granted him a pardon, the exercise of the pardoning power being the only relief attainable.

"The advisory or Schofield board was called and investigated this case in the year 1878. They sat at West Point, and I desire to call the attention of the Senate to one of their findings, which is the key to this whole question, in my view of it. They say:

"The evidence of bad animus in Porter's case ceases to be material in view of the evidence of his soldierly and faithful conduct. But it is our duty to say that the indiscreet and unkind terms in which Gen. Porter expressed his distrust of the capacity of his superior commander can not be defended. And to that indiscretion was due, in very great measure, the misinterpretation of both his motives and his conduct and his consequent condemnation.

"Now, I am unwilling by my vote to assent to the proposition that there was such a grave indiscretion committed on the part of the court-martial or on the part of the President of the United States. The fact that Porter was disloyal to his commanding officer is found by this advisory board as a fact which can not be excused, and that this is the foundation of the whole of Porter's disobedience of the orders of his superior commanding general. It all rests there. Porter's fall was the 'first fruit of his disobedience' and its legitimate result.

"The advisory board committed a grave error in saying that the court-martial were guilty of an indiscretion or that President Lincoln was guilty of an indiscretion. Mr. Porter was dismissed the service at a time when we wanted generals, and when there was no other reason for dismissing him but a conviction; he was guilty. We do not want any more generals now. He has, by the action of the President, been relieved from the sentence and rendered eligible to office, but this bill proposes to go further than that, and create a place for him, an extra position not provided for by the law as it now stands. I can not consent to that. I would as quick think of going to the city of Springfield, in Illinois, and tearing the granite base from the monument which has been erected to the memory of our martyred President, and razing it to the ground, as I would consent to or aid in tearing his signature from the judgment of the court-martial, as confirmed by him and executed until its execution was arrested by the interposition of the pardoning power."

Mr. Hoar, of Massachusetts, said: "I do not propose to enter at this late period upon a discussion of this case, but it seems to me proper that I should state very briefly the views which will govern me and have already governed me in casting my own vote.

"I need not say that it has been one of the most painful public responsibilities I have ever encountered. I am bound by my duty as a Senator to act upon a question which involves the consideration of evidence relating to a science; relating to military transactions which are very far removed from my own ordinary experience and from the studies to which my life has been given.

"I suppose a soldier called upon to deal with the question of the conduct of a lawyer in a complicated patent cause, or a question involving contingent remainders, would not find himself much more puzzled than I have been in attempting to master some of the details which relate to the important, intricate, rapid military operations of the three or four days which have been under discussion in this debate. But still I am forced to do my best, and I am bound to do it conscientiously, fearlessly, without regard to any personal consequences or anything else but the fact and the law as they shall appear to my mind upon such study as I have been able to give.

"Now, Mr. President, what is the precise attitude of this case? In the year 1868 a military tribunal, composed of able and upright soldiers, condemned this officer for grave military offenses, sentenced him to be cashiered and sentenced him to be incapable of holding any office of honor, trust, or profit under the United States during the remainder of his life. I regard that judgment as the final judgment of a constitutional court. It is true that courts-martial, whether in the army or in the navy, like all other human mechanisms, are a very

imperfect method for the administration of justice. Their rules of evidence are not those which prevail in common-law tribunals. They have no jury. The prosecution selects the court. The action is had hastily, and when the act is done there is an end.

"But I do not either criticize that arrangement or mention it as affording any reason whatever for failing to pay the same respect to the conclusions of this court as if they were the conclusions of the Supreme Court of the United States, or of a Circuit Court where a jury had been empaneled. The experience and wisdom of civilized nations have been unable to devise any better system than this for the trial of military or naval offenses. The soldier who goes into battle, who takes his life in his hand, who exposes his health and life, who abandons all the ordinary occupations of life, exposes himself also, for the public good, and as a public necessity, to having his rights, his conduct, his life affected by tribunals of this class. They are the best, and no soldier has a right to complain.

"But it is also true that the pardoning power, as I believe, for the sentences of such courts is properly lodged in the President of the United States; and it is also true that Congress has the undoubted clear constitutional right, if it conceive any injustice has been done, to permit the restoration to the army or navy of an officer whom a court-martial has caused to be dismissed. Since I have been in the Senate, numerous cases have arisen where officers cashiered for drunkenness have been restored, by permission of an act of Congress, to their former rank in the army or navy, Congress acting, if not with absolute unanimity, by large and emphatic majorities.

"Now, what are we asked to do? We are not asked now to reverse the judgment of this court-martial. We are not asked to give or provide for a new trial, as we were asked two or three years ago. In my own judgment that can not lawfully be done, even by the consent and on the motion of the accused himself. Gen. Porter is out of the army, and I do not think, even by his consent, we could provide for a retrial of this cause. If we could, the tribunal retrying it might now sentence him to be shot—a man in time of peace, a man not belonging to army or navy, without a trial by jury or right of appeal to the higher courts.

"But the last Chief Magistrate of the United States, Mr. Hayes, being of opinion that by the access to Confederate testimony one half of the case previously unknown might be disclosed, summoned, for his advice and to his assistance, a board composed of high and intelligent army officers. As has been well said, that board was not a lawful board in the sense of having power to administer oaths or to render a binding judgment; but it was the only course open to the President of the United States to have these facts investigated by some competent authority, for his information and for ours. That board

made its report, and upon that report the present President of the United States, Mr. Arthur, has pardoned the offense.

"I do not agree with those Senators who think it is a condemnation of, much less an insult to, the memory of President Lincoln or to the memory of President Garfield, a member of the original court, or anybody else, to grant this officer the relief which is asked. Was it ever heard before that the Executive, in issuing a pardon, especially a pardon on newly-discovered evidence, insulted the court or jury who found the original verdict or passed the original sentence? Is every new trial granted by a court with a different verdict an insult to the original court, especially when it is upon newly-discovered evidence? Suppose President Lincoln should have disapproved the finding of the original tribunal, as he did of many a court-martial. I have yet to learn that a difference in judgment, not on the same facts but on the same facts taken with others, is any reproach to the person with whom you so differ.

"The present head of the army, as I have said, under his official executive responsibility, has thought fit to pardon this officer and to remit what remains of the sentence, and that is the only action which in the least modifies or trenches upon, or can modify or trench upon, the act of the original court-martial.

"Now it is asked, giving such weight as we choose to the action of the President, giving such weight as we choose to the newly-adduced evidence, giving such weight as we choose to the opinion of the head of the army at the close of the rebellion and the executive head of the army for eight years after the rebellion ended, that we shall pass an act which simply permits hereafter the President and the Senate, if they see fit, to restore this man to the army so far as that he may be placed upon the retired list, at the discretion of the President. In other words, this present bill does not deal with the question of the guilt or innocence of Fitz-John Porter in terms and technicality; it only authorizes the President of the United States hereafter, with the advice and consent of the Senate, to treat him as a person eligible to the office which he formerly held, under the particular circumstances.

"Is there sufficient reason for such action? I do not, of course if I were capable, I should not at this time undertake to go over the evidence in detail; but this thing is true, as it seems to me: Gen. Porter was condemned by that court-martial in ignorance of such facts in regard to the military situation of the 28th and 29th of August, 1862, as could be learned from the reports and testimony of men who were opposed to him in those days.

"In the judgment of these high military authorities, including the President of the United States charged with his official responsibility, that newly-disclosed evidence makes a new case. I am not now speaking of the 6.30 order of the afternoon of the 27th, but of the charge of

a failure to attack, a failure to advance and go to the assistance of the troops in battle, and the charge of having retreated during the action, whether you call it a battle or a series of actions, on the 28th of August; and these high military authorities declare that upon the study which they have given this has become a new and different case. The case on which this man was tried is not the case which is now presented to those who in any responsible situation have to try it.

"Mr. President, it seems to me, on a full examination of this evidence, that the evidence is such as to afford a fair support to that opinion. I recognize the great military authorities that are opposed to it. I do not think if I were to select mere authority on which my judgment was to be guided that I should select two men in the United States on whom I would place higher reliance than two members of the present Committee on Military Affairs, the Senator from Illinois (Mr. Logan) and the Senator from Connecticut (Mr. Hawley). The Senator from Illinois is himself an illustrious soldier. He is himself accustomed to deal with evidence as a lawyer. The training of his life, both civil and military, has fitted him to deal with such questions. And I do not think that any authority on the other side as mere authority is entitled to greater weight than his. I should also place very great reliance in such a case upon the opinion of my distinguished and illustrious friend from Connecticut, who concurs with the Senator from Illinois in this case. But it does seem to me, looking at the case as well as I am able to do, that the newly-discovered evidence, whether the conclusion as to Porter's guilt or innocence might be the same, does make out a case so different in the circumstances that it warrants us in passing a law which shall permit the President if he see fit, and the Senate if hereafter it shall see fit, to allow this man for the little remnant of his days to be restored to his old profession.

"Then you come to the specification in regard to the disobedience of orders on August 27th—the 6.30 order. Who can believe that if the other facts in the case had been out of the way the court or President Lincoln ever would have sentenced this man to the severe punishment to which he was sentenced on that finding alone? Whether it be true or not true that the military law required an attempt to march over that road that night, encumbered with wagons to the extent to which it was, the extent being in dispute, or not; or whether that officer, being an officer with a separate command, receiving his order from a superior ignorant of the precise condition of things which he had to meet—whether the military law and custom permitted him under such circumstances a discretion or not, this thing is, it seems to me, well established, that a very large number of able, honest, experienced military men were in the habit of exercising and in the habit of permitting the exercise of such dis-

cretion; and who can believe that he being wrong in an opinion in regard to a state of facts in which, if he was wrong, Grant is wrong, in which if he was wrong Longstreet is wrong, in which if he was wrong Terry is wrong, in which if he was wrong Schofield is wrong and Getty is wrong—who can believe that if this single specification stood alone, General Porter would have been condemned with this severity of sentence?

"Mr. President, we are not wiping out the sentence of Fitz-John Porter. That man has tasted for twenty years the bitterness of that judgment. No cup of death was ever presented to human lips which, it seems to me, could be so bitter as that which has been the daily and the nightly draught for twenty years of this officer, who, at least, once and some time deserved well of the republic.

"Will the Senator from Illinois say that the President of the United States, in pardoning this man, meant to affront or did affront the great and mighty shades of Lincoln and of Garfield? He thought that in the doubt upon this question it was time at least that justice should stop and that mercy should have her place. Over that name honored for generations in the military and naval history of this country—you can hardly look upon the stars and stripes on our flag that you do not think of the name of Porter—for twenty years has rested the burden of this shame, worse than death, worse than torture, and no act of Congress, no act of God can wipe that away.

"Not Fate herself can o'er the past have power,
But what has been has been.

"And he has had, in shame and agony—he has had his hour.

"Now, Mr. President, I do not know what bitter passion, I do not know what prejudice, I do not know what honest love of country, I do not know what feeling of a patriotic and generous soldiery may be encountered by the vote I am about to cast. I know this, that I would rather incur almost anything myself than to incur the disapprobation of some men whom I shall seriously grieve by the conclusion to which I have come. It is not an easy thing for a Republican, a partisan, a man whose life has been given to the advocacy and the support of the doctrines of this party, to incur the disapprobation and the condemnation of his political friends who sit about him on a great question of state; but I thank God that after hesitation and doing my best to discover what my duty requires he has given me the grace to perform it.

"I do not believe, studying this testimony, that the burden of this condemnation ought to rest longer upon the head of this man unless on such re-examination of the facts as it will be the duty of President Arthur hereafter to give, and on such re-examination of the facts as it will be the duty of the Senate hereafter to give, one or the other (for it will require the concurrence of both to restore him) should

be of opinion that he ought not to be restored.

"So thinking, Mr. President, I believe that if Abraham Lincoln sat in this seat to-day and could read the testimony which has come from the reports of Longstreet and of Lee, changing, as it seems to me, so materially the military situation of that day, the vote of Abraham Lincoln, with his kind heart, with his sound sense, and his fearless independence in doing right, would be cast as I mean to cast my own."

The bill was passed by the following vote:

YEAS—Barrow, Beck, Brown, Butler, Call, Camden, Cameron of Pennsylvania, Cockrell, Coke, Davis of West Virginia, Farley, Garland, George, Gorman, Groome, Hampton, Hoar, Jackson, Jonas, Jones of Florida, Lamar, Maxey, Morgan, Pendleton, Pugh, Ransom, Saulsbury, Sewell, Slater, Vance, Vest, Voorhees, Walker—38.

NAYS—Aldrich, Anthony, Blair, Cameron of Wisconsin, Chilcott, Conger, Davis of Illinois, Dawes, Edmunds, Frye, Hale, Harrison, Hawley, Hill, Ingalls, Kellogg, Logan, McDill, McMillan, Miller of California, Miller of New York, Morrill, Platt, Plumb, Rollins, Sawyer, Windom—27.

ABSENT—Allison, Bayard, Fair, Ferry, Grover, Harris, Johnston, Jones of Nevada, Lapham, McPherson, Mahone, Mitchell, Saunders, Sherman, Van Wyck, Williams—16.

The preamble was then adopted by a separate vote. It was as follows:

Whereas, The board of Army officers convened by the President of the United States by special orders numbered 73, headquarters of the Army, April 12, 1873, to examine into and report upon the case of Fitz-John Porter, late a major-general of the United States volunteers and a brevet brigadier-general and colonel of the Army, having, by their report of March 19, 1879, stated that, in their opinion, "justice requires that his [the President's] hands such action as may be necessary to annul and set aside the findings and sentence of the court-martial in the case of Maj.-Gen. Fitz-John Porter, and to restore him to the position of which that sentence deprived him, such restoration to take effect from the date of dismissal from the service"; and

Whereas, The President, on the 4th day of May, 1882, remitted so much of the sentence of said court-martial remaining unexecuted as "forever disqualified the said Fitz-John Porter from holding any office of trust or profit under the Government of the United States": Therefore, that justice may be done the said Fitz-John Porter, and to carry into effect the recommendation of said board.

The consideration of the measure was objected to in the House, Jan. 17th, and so it failed.

Increase of Pensions.—The House bill increasing the rate of pensions of soldiers that have lost an arm or a leg in the service was taken up in the Senate Feb. 26th. It was as follows:

As it enacted, &c., That from and after the passage of this act all persons on the pension-roll, and all persons hereafter granted a pension, who, while in the military or naval service of the United States, and in the line of duty, shall have lost one arm, one hand, one leg, or one foot, or shall have suffered disability equal thereto, shall be entitled to a pension of \$40 per month.

It was discussed at some length, and various amendments were proposed and defeated,

among them one for pensioning veterans of the Mexican and Indian wars up to 1856. In discussing this question, Mr. Hoar, of Massachusetts, said:

"I hope the Senator will not insist on embarrassing this question with that which relates to a wholly different war. I am in favor of pensioning every surviving veteran of the Mexican War on precisely the same terms, or on better terms, than were allowed to veterans of the Revolution, at the same distance of time from the close of that war, or on the same terms, or better terms, than were allowed to veterans of the War of 1812, at the same distance of time from the close of that war, or on the same terms that are allowed to veterans of our late war; but I am not in favor of putting upon the pension-roll of this country surviving veterans of the Mexican War whose disabilities have not been removed, and who contemptuously refuse to have their disabilities removed. I have no desire to say anything which will excite angry debate or unpleasant recollections, but the Senate know very well what I refer to when I make this observation; and, if it becomes necessary, it is a subject which I shall discuss with great plainness.

"This proposition would put upon the pension-roll persons who contemptuously refuse the amnesty of the Government. It would put upon the pension-roll also men who are rich, hale, strong, in active and robust middle life, when that never has been done by this Government in regard to the veterans of any other war. The veteran of the Revolution was obliged to prove, for nearly forty years after that war closed, his need, and to accompany his proof with a schedule of his real and personal property. I should not for one be disposed to make such a requisition in regard to any living surviving veteran. The veteran of the War of 1812 was not put upon the pension-roll without regard to his need until the youngest surviving veteran of that war had reached the age of seventy-eight years and most of them had reached the age of over eighty-four years, so that age itself was a disability. The dependent father, the dependent mother, of the soldier of our late war for the Union is obliged to prove that dependence and need in order to obtain a pension; and the veteran himself, though twenty years have elapsed, does not receive a pension except in case of a disability. Why should the survivors of the Mexican War and of the Indian wars be singled out from every other class of soldiers, and have a bounty extended to them which we have not extended to anybody else?

"I wish to call attention to the fact that the Senate, as I believe, has been ready, this side of the chamber has been ready (of course those soldiers are upon the pension-rolls under the general pension law), to extend to the veterans of the Mexican and Indian wars a liberal policy, which will enable all those who are in need and who are under no existing disability to re-

ceive the pension of the Government if they desire it."

Mr. Call, of Florida, said: "Mr. President, I do not propose to detain the Senate with any discussion on this question. For four years I have been endeavoring to get some little tardy justice done to the veterans of the Indian wars and to those of the war with Mexico. Bill after bill, resolution after resolution, has been referred to the Committee on Pensions, but no report has ever been obtained, either favorable or unfavorable.

"I apprehend that nobody can deny, upon the principles upon which this bill is proposed to be voted for, that the survivors of the Mexican War and the survivors of the Indian wars, that conquered the territory from the savages and acquired it from foreign countries, ought to be pensioned, especially those who are in destitution, those who are a disgrace to the country, because they are left to strive in absolute penury and want, as time after time, year after year, bill after bill, resolution of legislature after legislature are brought to Congress appealing for this small meed of justice to men who have served their country gallantly and well, and who are in absolute need and destitution. I therefore think that there can be no question that as a matter of doing justice to soldiers of another war this is a proper amendment to be attached to this bill.

"There never has been an occasion when I have not aided in granting reasonable pensions through the system of special bills, which is the appropriate and proper system of relief, because a man may have lost one leg or one arm or some other member of the body and still be a capable and an efficient man, able to take care of himself and to acquire a living. A remedy has always been afforded, and it is the proper way to afford relief by special bill in Congress for a special case. I have never refused and I have voted time and again upon special bills for the relief of pensioners whose cases were special, and who required a larger amount than the amount appropriated by the general bill. In my judgment that is the proper system. No man who has been a soldier and who has done his duty gallantly and well and is in a state of suffering, should be allowed to want for the adequate means of subsistence and comfortable support. The system of special bills is the only mode in which his particular case can be reached; it can not be done by a general bill.

"As I said, it does not follow because a man has lost one arm or one leg that he is not a more capable and efficient man than those not so wounded. He may have lost none, and yet be the victim of the most severe and extreme suffering and incapacity.

"In my opinion the bill does not meet the necessities of the soldiers. I for one have always voted and I am always willing to vote to the full extent of the capacity of this country to pay, and to pay liberally, every soldier who

is in need that amount which is necessary for his comfortable support. That is the reason why this amendment should pass, pensioning the survivors, now but few in number, of the Mexican War and of the Indian wars. The legislature, I believe, of every State at different times has passed resolutions recommending it.

"If the Senator from Massachusetts can see in the present condition of the country, twenty years after the war of the rebellion, a necessity for putting upon the amendment some condition which shall attach to persons who have not applied for and received an amnesty, let the amendment be proposed, and if it is the pleasure of a majority of the Senate that it shall be passed, let it be done. There is no reason why this amendment should not be passed. If he wishes to apply to it terms which shall limit it to the indigent soldiers, to those who are in absolute destitution, let such an amendment be proposed."

Mr. Morgan, of Alabama, said: "It is true that the veterans of the Mexican War have been a long time lingering here, petitioning the Congress of the United States for some recognition of their services. They perish one by one. A great many of them are living now in the last remnants of their lives in abject poverty. I know some of them myself who are in extreme necessity. The Congress of the United States refuses to allow them an opportunity even to prove that they are in a necessitous condition, and, while doing that, Congress is adding by this bill more than twice the amount of money which the Senator from Florida proposes to pay them by way of addition to men who are already receiving pensions and have been enjoying the bounty of this Government for years together.

"This is a crying, shocking injustice. It is an outrage upon the respectability of the American character. It is an act of base ingratitude, and it is done by men who received and have in their possession a domain brought as a dowry to the people of the United States greater than Cæsar ever brought to Rome.

"No set of men have ever suffered in the cause of their country so heroically, so patriotically as the soldiers of the Mexican War, for the reason that they are the only class of men who have been called to invade a foreign country. All the other men who have fought and bled and suffered on this continent have done so in defense of their own homes and firesides; they have done so in respect to a principle which animates every honorable man in the world. A man who will not fight for his own homestead and for his own family and his own fireside is not worthy of the respect of mankind; he is not worthy of their confidence or of their bounty. When he has done so I am willing that the country shall be liberal and generous toward him. When you carry your flag into a foreign country, and it is followed by the brave men who volunteer

in the service of your country, and they come back bearing it in victory and triumph to their own Government, laying at the feet of power in the Government of the United States a domain the richness of which is incalculable, beyond all calculation, then for us to turn to those old men when they are perishing one by one, and tell them that we will not grant them \$8 a month with which to buy their bread, will only prove the ingratitude and the baseness of this generation.

"When that subject is presented a Senator rises on this floor and makes a threat that he will make some very plain remarks about the political opinions of some of the men who fought when that Senator was a boy, perhaps a youth at college somewhere. For the purpose of preventing the Government of the United States from giving those men an opportunity to keep out of the poor-house the Senator says that he will have some plain remarks to make about something that they have done since that time. Let him make his remarks; let him wage his war against those men.

"We have no right to deny to those men this contribution to their necessities in their old age and in their infirmity; it makes no difference what their opinions may be, it makes no difference what they have done against this country. If one of them had been consigned to the penitentiary and had served out his term he would have a right to claim the bounty of this Government for services which he rendered before the stigma of conviction fell upon him. If one of them was engaged in the rebellion and has since been pardoned by the general amnesty of the Government of the United States, he is restored to all his rights and privileges as freely and as fully as the Senator from Massachusetts.

"This complaint against one or two individuals in the United States is constantly paraded here for the purpose of gaining an opportunity to deny justice to thousands and tens of thousands, I am afraid there are, of the survivors of the Mexican War.

"There are about 8,000 of them. While we are bestowing money under a bill which Senators variously estimate at from five million to fifty million dollars to men who have done nothing except to serve their country around their own firesides and protect and defend them against a domestic foe, while those men professed to be, and I have no doubt were acting in obedience to one of the highest instincts and impulses of every honorable spirit in the world, while we are rewarding them and doing it properly for the service they rendered, we are refusing to reward the men who carried our flag into a foreign country, and who came back to us loaded with an empire of wealth the like of which no country ever acquired before with so little expenditure of blood or of treasure.

"Sir, the results of the Mexican War to the

people of the United States in actual dollars and cents are greater than any conquest that can be named which has been achieved in a single war by the Anglo-Saxon people; and we, the inheritors of this vast wealth, with overflowing coffers, with a Treasury that we are trying to deplete by every measure that we know, now refuse the bread of life to the poor men who bore this banner in their youth to victory in a foreign land, and have returned only to experience the truth that this country is ungrateful to them.

"I have now said all that I expect to say on this occasion about this bill. I expect the proposition again to be trampled under foot, again to be voted down, and it will be two years, yes, it will be five times two years, before the Senate of the United States will get its consent to give those men \$8 a month; and while we are refusing that we will run back upon the pension-list and we will vote a sum of money that amounts to \$100,000,000 a year to men who have got no higher claim to the gratitude of this country than that they fought for their own homesteads, their own families, and their own firesides."

Mr. Voorhees, of Indiana, said: "Mr. President, there is one part of the amendment of the Senator from New Hampshire that I accept, and that is that the beneficiaries of this provision shall take the oath of allegiance. I care nothing for that, but I would ask no man to proclaim his indigence. I would ask no man to certify to his destitution and poverty. That is mean charity.

"Men who have rendered distinguished services that the whole world recognizes should not be brought to the block, as it were, to certify that they are poor and want their pauper's soup-bowl filled by Government charity.

"Whether we have gone as far from the scenes of the Mexican War as we did from those of the Revolutionary War or the War of 1812 before we granted pensions is not the question. The soldiers of the Mexican War achieved such success in a material sense as should disarm the economy or the avarice, or whatever else you may call it, of members of Congress. If a statue of gold were erected at full life-size to every surviving Mexican soldier it would not be one-quarter of 1 per cent. of what they have given this Government. Let me repeat it: If a statue of gold, life-size, were erected by our Government to every surviving soldier who fought the battles in Mexico, it would not cost one-quarter of 1 per cent. of that which they acquired for this Government. I state that simply materially considered, considered in point of dollars and cents; but when you estimate the glory which they gave this country throughout the world, the renown which they achieved, it can not be estimated even in statues of gold.

"I was deeply impressed with the letter read by the Senator from Tennessee (Mr. Jackson), stating that while we are asking addition-

al vaults and chambers to relieve those that are now plethoric with the precious metals acquired by the valor of those men, the remnant of whom we are speaking for, it is objected to, and there is a parsimonious and higgling spirit in regard to allowing them anything.

"I once before on this floor took occasion to speak of this question as it really exists, and that is as a sectional question. New England had but little share in the Mexican War. We might as well tell the truth while we are going along. State after State in New England had no concern in it. The State of the Senator from Massachusetts had but little share in it except by purchased troops. Other States in New England had not one single soldier there.

"I intend to advertise the country again of the fact that New England was opposed to that war and had no troops there. I will qualify that expression to this extent: when I say that New England had no troops there I do not mean literally that there was nobody there from New England, but I do mean that New England gave no support to the Mexican War. I mean further that I can take a map and outline the boundaries of this Government as it would have been if New England had had her policy. She fought Jefferson. Jefferson purchased Louisiana, with her outlying, vast, and vague boundaries, and New England wanted to impeach him. James K. Polk, another Democratic President, fought the war with Mexico, and New England fought him.

"The results of Jefferson's purchase are known and the results of the Mexican War are known.

"If the policy of New England had prevailed, if the old Federal idea had obtained, this day and this hour I would hold up on the floor of the Senate the map of the United States bounded on the west by the Mississippi river. The Senator from Massachusetts well knows that fact. I challenge him to show a single instance where New England has ever advocated the advancement of the standard of this country beyond the Mississippi river. When I say that I say it with regard, so far as he is personally concerned, because I call to mind while saying it a most liberal, broad, and national letter of his last summer on the subject of the improvement of the Mississippi river. I do not include him in any criticism of the policy of the past, but I speak of the past as it is. If this hour the policy of the old Federal party was stamped upon the map of the United States, it would be found as it is hung up in the office of the Commissioner of the Land-Office, at the Department of the Interior. I have looked upon it, and I proclaim here that every step beyond, every step on the sunset side of the Father of Waters, is due to the spirit, policy, action, and legislation of the Democratic party, and in direct hostility and triumph over the policy of New England and the Federal party of that section.

"I find every time that the question of paying these old veterans who exist in a few numbers in each county in the United States except New England, ten or fifteen in the various counties, poor, humble, waiting—whenever a question arises here to do something for them, however small, it is encountered by that section of the country which had neither sympathy, action, nor men in that movement.

"I do not know that the amendment of the Senator from Florida is to obtain to-night. I expect not. It will be obstructed in some way. I did not intend to advocate a single amendment to the original bill 1410, that came here from the House, nor did I. I opposed every one of them. I voted against the amendment of the Senator from New Hampshire, which I thought very well of. I opposed the amendment of the Senator from Connecticut, which is not entirely objectionable, but I wanted this bill that came from the House, pure and simple, to help one-legged and one-armed men, to pass, and so I voted against amendments that were in themselves meritorious.

"But now, inasmuch as the amendment of the Senator from Connecticut has been adopted, I shall vote for one more; I shall vote for this amendment offered by the Senator from Florida. I would not vote for it, much as I approve of it, if the bill had not already been amended; I would keep it pure and clean; but whenever the question of paying the survivors of the Mexican War comes before the Senate I shall adhere to what I have heretofore said, that I shall meet this question, always raised on the part of New England in the interest of economy, but I think in the interest of an ancient policy on their part, as I have met it here to-night."

Mr. Edmunds, of Vermont, said: "I do not know any reason why a professional man who is destitute and who served his country should be excluded from the benefit of his country's gratitude, while the man who is not a professional man should receive it. That is not the way to tempt professional people and mercantile people, and all the other body of people except day-laborers, to uphold the flag of their country. The amendment itself, therefore, if it means what my friend thinks it does, proceeds upon a false theory, in my view. But no matter for that, I do not want to take up time about that.

"The difference between the case we have in hand, the men whose legs and arms are gone, and the case the Senator from Mississippi states, is this: In this case we know that these people are in their present condition in consequence of their service; the indigent survivors of the Mexican War who do not already have pensions for disability incurred in the line of duty are indigent, are sick, or in trouble, not because they were soldiers of the United States, but because like the rest of mankind they are subject to the infirmities of human nature and to the changes

and chances of this mortal life. I do not mean to say that that is not a reason why our gratitude should be applied to them, but I say it marks a clear distinction that we ought to observe—unless we mean to destroy this bill for the benefit of those whose legs and arms are gone, which I can not impute to the Senator from Mississippi, a distinction that we ought to observe, and not embarrass one thing that we all agree about, I hope, by another that is not so clear.

“Now, when you come to the question of pensioning people who have served their country in war because they are now in need, what difference do years make? Why should not the soldier of the Union of 1861 to 1865 who is now indigent, and in trouble and distress, be just as much entitled to the gratitude of his country as the soldier of the Mexican War who is now indigent and in trouble and distress, I should like to know? I am unable to see that time has anything to do with that question. I should be glad to have somebody explain how it can have.

“We did pension all the survivors of the Revolutionary War fifty or sixty years afterward, because they, like a great many other things that happened at that time, as long periods of years went on, became mere monuments of national glory, a few people scattered here and there that the country was able and glad to decorate them with this honor, as well as to provide for them in their old age. I repeat that in my opinion there is no distinction in principle between providing for the indigent soldiers of the war for the Union, if I may call it so—others call it the war between the States, the civil war, and so on—there is no distinction in principle that can be made between the Mexican soldiers and the soldiers of 1861-'65 if you put it on the ground of necessity. But I say in either case that the question that is before the Senate on this House bill as amended is an entirely different one from the one proposed by the Senator from Mississippi, and if I did not know his patriotic impulses I should suspect that the effect might be (as I am afraid it may be, though the purpose may be a legitimate and parliamentary purpose) to destroy this measure for the people who stand before our eyes, maimed for all their lives in the service of their country, to have this little addition to their support, by getting up a question of this kind.”

Finally, Feb. 28th, an amendment was adopted to strike out all after “duty,” and insert the following:

Shall have lost one hand or one foot, or been totally or permanently disabled in the same, or otherwise so disabled as to render their incapacity to perform manual labor equivalent to the loss of a hand or a foot, shall receive a pension of \$24 per month; that all persons now on the pension-roll, and all persons hereafter granted a pension, who in like manner shall have lost either an arm at or above the elbow, or a leg at or above the knee, or shall have been otherwise so disabled as to be incapacitated for performing any

manual labor, but not so much as to require regular personal aid and attendance, shall receive a pension of \$30 per month: *Provided*, That nothing contained in this act shall be construed to repeal section 4699 of the Revised Statutes of the United States, or to change the rate of \$18 per month therein mentioned to be proportionately divided for any degree of disability established for which section 4695 makes no provision.

The bill was then passed by the following vote:

YEAS—Aldrich, Allison, Blair, Cockrell, Conger, Davis of Illinois, Dawes, Hale, Harrison, Hill, Hoar, Ingalls, Lapham, Logan, McGill, McMillan, Miller of New York, Mitchell, Morrill, Platt, Plumb, Rollins, Sawyer, Sewell, Sherman, Vest, Voorhees—87.

NAYS—Barrow, Bayard, Beck, Call, Coke, Garland, George, Harris, Jonas, Maxey, Morgan, Pugh, Walker, Williams—14.

ABSENT—Anthony, Brown, Butler, Camden, Cameron of Pennsylvania, Cameron of Wisconsin, Davis of West Virginia, Edmunds, Fair, Farley, Ferry, Frye, Gorman, Groome, Grover, Hampton, Hawley, Jackson, Johnston, Jones of Florida, Jones of Nevada, Kellogg, Lamar, McPherson, Mahone, Miller of California, Pendleton, Ransom, Saulsbury, Saunders, Slater, Tabor, Vance, Van Wyck, Windom—35.

March 2d, the House concurred in the Senate amendment, and March 8d the President approved the bill, and it became a law.

Bills Passed.—Apart from the measures already considered, the regular appropriation bills, and bills of a private character, the following measures were passed at the second session of the Forty-seventh Congress and received the approval of the President:

To provide for the erection of a monument to the memory of Maj.-Gen. the Baron de Kalb.

To permit grain brought by Canadian farmers to be ground at mills in the United States adjacent to Canadian territory under such rules and regulations as may be prescribed by the Treasury Department.

To extend the time for filing claims for horses and equipments lost by officers and enlisted men in the service of the United States and for other purposes.

To reimburse the State of Oregon for moneys paid by said State in suppression of Indian hostilities during the Modoc War in the years 1872 and 1873.

In relation to certain fees allowed registers and receivers.

To amend section 3362 of Revised Statutes.

Prescribing regulations for the Soldiers' Home, located at Washington, in the District of Columbia, and for other purposes.

To amend an act donating public lands to the several States and Territories which may provide colleges for the benefit of agriculture and the mechanic arts.

To authorize the construction of certain bridges and to establish them as post-roads.

To increase the fees of witnesses in United States courts in certain cases.

Authorizing the Commissioner of the Freedman's Savings and Trust Company to examine and audit certain claims against said company, and to pay certain dividends barred by the act of Feb. 21, 1881, and for other purposes.

To amend section 3760 of the Revised Statutes.

To encourage the holding of a World's Industrial and Cotton Centennial Exposition in the year 1884.

To amend sections 6 and 7 of the act providing for the publication of the Revised Statutes and the laws of the United States, approved June 20, 1876.

Providing for the termination of articles numbered 18 to 25, inclusive, and of article numbered 80 of the treaty between the United States of America and her Britannic Majesty concluded at Washington, May 8, 1871.

To refund to the State of Georgia certain moneys expended by said State for the common defense in 1777.

To afford assistance and relief to Congress and the Executive Departments in the investigation of claims and demands against the Government.

Making Saint Vincent, in the State of Minnesota, a port of entry in lieu of Pembina, in the Territory of Dakota.

To amend section 4214 of the Revised Statutes, relating to yachts.

To amend section 1860 of the Revised Statutes so as to exclude retired army officers from holding civil office in the Territories.

Amending sections 1928 and 1927 of the Revised Statutes so as to extend the limits of the jurisdiction of justices of the peace in the Territories of Washington, Idaho, and Montana.

Relating to exportation of tobacco, snuff, and cigars in bond free of tax to adjacent foreign territory.

To exclude the public lands in Alabama from the operation of the laws relating to mineral lands.

Authorizing and directing the Postmaster-General to readjust the salaries of certain postmasters in accordance with the provisions of section 8 of the act of June 12, 1866.

Supplementary to an act approved Dec. 17, 1872, entitled "An act to authorize the construction of bridges across the Ohio river, and to prescribe the dimensions of the same."

To amend the act entitled "An act to repeal the discriminating duty on goods produced east of the Cape of Good Hope," approved May 4, 1882.

To authorize the construction of bridges over the Ogeechee, Oconee, Ocmulgee, Flint, and Chattahoochee rivers in the State of Georgia.

To authorize the construction of a bridge across the Thames river near New London, in the State of Connecticut.

To establish a railroad-bridge across the Illinois river, extending from a point within five miles of Columbiana, in Greene county, to a point within five miles of Farrowtown, in Calhoun county, in the State of Illinois.

For the allowance of certain claims reported by the accounting officers of the United States Treasury Department.

To establish certain post-routes.

To amend an act entitled "An act to authorize the construction of a bridge across the Missouri river at the most accessible point within five miles above the city of Saint Charles, Missouri," approved April 14, 1882.

To create three additional land districts in the Territory of Dakota.

To prevent the importation of adulterated and spurious teas.

To adjust the salaries of postmasters.

Relative to the Southern Exposition to be held in the city of Louisville, State of Kentucky, in the year 1883.

To authorize the construction of a bridge across the Missouri river at some accessible point within ten miles below and five miles above the city of Kansas City, Missouri.

Providing for a new mixed commission in accordance with the treaty of April 26, 1866, with the United States of Venezuela.

Validating certain contracts executed by the Postmaster-General.

To provide for the admission, free of duty, of articles for a special exhibition of machinery, tools, implements, apparatus, etc., for the generation and application of electricity, to be held at Philadelphia by the Franklin Institute.

To admit free of duty a monument to Gen. Washington.

Granting right of way to the Fremont, Elk Horn Valley, and Missouri River Railroad Company across the Niobrara military reservation, in the State of Ne-

braska, and authorizing the sale of a portion of said reservation.

To ratify the issuance of duplicate checks in certain cases by the Superintendent of the Mint of the United States at San Francisco.

To authorize the Seneca nation of Indians, of the State of New York, to grant title to lands for cemetery purposes.

Authorizing the Committee on Printing to instruct the Public Printer relative to the maps, etc., for the census reports.

Granting right of way for railroad purposes and telegraph line through the lands of the United States included in the Fort Smith Military Reservation at Fort Smith, in the State of Arkansas.

To authorize the Public Printer to make certain purchases without previous advertisement.

To provide for extra work in the Government Printing-Office in cases of emergency.

To rectify and establish the title of the United States to the site of the military post at El Paso, Texas.

To attach the county of Hardeman, in the State of Tennessee, to the Eastern Division of the Western District of Tennessee.

To cede to the first taxing district of the State of Tennessee a certain lot of land situated in said district.

To provide for the binding of the Compendium of the Tenth Census.

To confer upon the senior associate justice of the Supreme Court of the District of Columbia, in the absence or inability of the chief-justice of said court, the power and duties now conferred upon said chief-justice relative to the extradition of fugitives from justice.

More effectually to suppress gaming in the District of Columbia.

To punish larceny from the person in the District of Columbia.

To amend certain sections of the Revised Statutes relating to the District of Columbia.

To levy an assessment of the real estate in the District of Columbia in the year 1883, and every third year thereafter, for purposes of taxation.

To increase the police force of the District of Columbia, and for other purposes.

Constitutional amendments were proposed on the following subjects: To allow the veto of separate items in appropriation bills; to authorize the veto of separate items in the River and Harbor Bill; to create a House of Electors to confirm appointments in the civil service; to amend the provisions for the election of members of Congress; to amend the provisions for the election of President; to provide for woman suffrage; and to give Congress power to enforce contracts made by States.

CONNECTICUT. State Government.—The following were the State officers during the year: Governor, Thomas M. Waller, Democrat; Lieutenant-Governor, George G. Sumner; Secretary of State, D. Ward Northrup; Treasurer, Alfred R. Goodrich; Comptroller, Frank D. Sloat. Judiciary: Supreme Court, Chief-Justice, John D. Parks; Associate Justices, Elisha Carpenter, Dwight W. Pardee, Dwight Loomis, and Miles T. Granger.

Legislative Session.—The Legislature convened on the 8d of January, and adjourned on the 8d of May, the longest session on record in the State.

The creation of a Board of Pardons was one of the most important and most needed measures of the session. The act provided as follows:

His Excellency the Governor, a Judge of the Supreme Court of Errors, to be designated for that purpose by the judges of that court at their annual meeting, and four persons to be appointed by the General Assembly, one of whom shall be a physician, shall constitute a Board of Pardons for this State.

A unanimous opinion will be necessary to a pardon.

The new law which enlarges and explicitly defines the duties of coroners makes a sweeping change, and a radically new departure, in the methods for the initial proceedings in probable cases of murder or suicide.

The Governor's salary was raised a little, made \$4,000. The State tax was made 1½ mill. A new military code bill was passed; a bill to stop the auctioneering of town paupers to the keeping of thrifty providers in other towns also became a law; the act to wind up the Townsend Savings-Bank passed; and so did a bill to compel dealers in oleomargarine to stamp their packages of that article with that name, and put it up also in large letters over the door.

A bill was passed to prevent a drunken father from taking the wages of his minor son.

A so-called consolidation bill was passed permitting any Connecticut railroad to unite with any other road that is entirely outside of this State, and to issue bonds, provided the line thus formed shall make one continuous route, and not be a parallel and competing line.

A bill to punish frauds in party primary meetings was passed; as was a bill to put a stop to "baby-farming." The commission to look into the irregularities of Secretary Northrup, of the Board of Education, submitted, and the legislature passed, a bill to reorganize that board on a new basis. A bill that practically permits Sunday-evening concerts passed. There was an appropriation of \$5,000 for a statue of Nathan Hale, to be placed on the Capitol.

An important and just measure was enacted empowering the judge, in divorce and other cases of separation, to assign the child or children to either parent, as he may decide.

Other measures passed were the following: Bill relating to annual meetings of Superior Court judges; bill relating to pay of county commissioners; bill amending the liquor law; resolution appropriating \$2,500 for repairs at the State Prison.

The Governor vetoed a bill reducing the tax on the bonds and floating indebtedness of railroads from one to one half of 1 per cent.

Biennial Sessions.—On this subject the Governor, in his message to the Legislature of 1884, says:

A proposed amendment to the Constitution, providing for biennial sessions of the General Assembly, received a majority vote of the last House of Representatives, and will be presented to you for final legislative action.

The people had an opportunity in 1879, after exhaustive discussion, to express their opinion of such a proposed change in our organic law; and the record shows that more than two thirds of them voted against

it. As nothing has occurred since to add to the strength of the argument then urged in its favor, it is not likely, if again submitted, to be disposed of in a different way. The objection to the present constitutional provision is, I apprehend, founded more upon the length than the frequency of sessions. If the public business could be annually disposed of in six or eight weeks, instead of occupying more than seventeen, as it did last year, there would be less difficulty in obtaining the services, as legislators, of the best citizens of the State; and few would favor abandoning yearly sessions with their traditional and educational influences.

Finances.—The falling off in the income—\$102,688.17—from the previous year, is largely accounted for by the failure of certain railroad companies to meet their taxes, and by the reduction of the amount heretofore paid by mutual-insurance companies of the State, as authorized by the act of 1882.

The funded debt was, Jan. 1, 1883.....	\$4,500,000
There has been paid in reduction thereof during the year	818,500

So that the amount of funded debt now is

Three and one half per cent. bonds of the issue of Dec. 1, 1883, have been sold, amounting to \$1,068,500, at a premium of 6·85 per cent., the largest ever received from the sale of State bonds.

The balance in the Treasury,	
Dec. 1, 1883, was	\$1,192,897 91
The income of the fiscal year, ending Nov. 30, 1883, was....	1,617,900 04
Received from sale of bonds ...	525,197 50
	<hr/>
	\$3,335,995 45
The expenditures were	
Paid for State bonds redeemed..	867,500 00
Balance on hand.....	887,968 80
	<hr/>
Total.....	\$3,335,995 45

Taxation.—On this subject the Governor says:

Under the law, as it is, if taxable property is not returned to the assessors, and they fail to discover it, it absolutely escapes all taxation; for no provision exists for the enforcement of a claim for taxation on property which has been concealed from the assessors, or inadvertently omitted from the grand list of a town. A large amount of property, in this way, is continually evading its part of the burden of public expense. If a statute were enacted authorizing towns, upon the discovery of unassessed property, to demand and collect of the party, who failed to return it, the amount—or double the amount—it would have been liable for, if it had been properly listed, it would be greatly for the advantage of citizens who comply with the law.

Savings-Banks.—There is in the control and management of the savings-banks of the State the sum of \$92,679,068.01, a larger amount than ever before, and mostly belonging to the thrifty industrial element of the population. There has been an increase of 8,659 during the year in the number of depositors, and of \$3,155,978.22 in the amount of their deposits. The commissioners suggest that, in their opinion, this interest needs no new legislation, except, it may be, in relation to a class of investments against which they have heretofore strongly protested. It appears that some of these institutions have invested in simply promissory notes, without collateral securities, the sum of \$4,080,766.79.

Railroads.—The permanent investment in railroads has reached the enormous sum of \$87,459,646.19. There are now, completed and in use, within the State limits, 1,860 miles of road, over which were carried, during the year, 16,852,617 passengers, nearly a million more than in any previous year. Their gross earnings amounted to \$16,284,942.44, yielding an average profit of four and one half per cent. on \$56,958,678.25, their aggregate capital.

The report of the Treasurer shows that these corporations have paid—protesting, however, against its excessiveness—the sum of \$456,128.55 in taxes to the State.

Schools.—There was expended, during the last fiscal year, in support of the common-school system, \$1,818,486.11, of which sum the State and the school fund together furnished \$386,289.50, and the balance was raised by local taxation. More than 60 per cent. of the amount derived from taxation comes from twenty-five of the largest towns, and one third of it from the six largest cities. There are in the State 149,466 children, between the ages of four and sixteen, 120,537 of whom attended these schools some portion of the year. The Governor says:

I have heretofore expressed an apprehension that our public schools, in the smaller towns of the State, are not as good as they were thirty years ago. Fuller information convinces me that such is the fact. In more than half the towns there are fewer children and less wealth than formerly; but the same number of districts, school-houses, and schools are maintained. In the 1,447 districts of the State, 56 schools average 5 or less pupils; 846 schools average over 5 and do not exceed 10; 822 schools average over 10 and do not exceed 15; 213 schools average over 15 and do not exceed 20.

The building, constructed at the expense of the State and the town of New Britain, is now completed and occupied by the Normal School. The junior class that entered in September is unusually large. A model school is in successful operation.

Courts.—The judicial expenses, amounting to \$226,848.42, are \$6,859.87 less than those of the previous year. During the year ending Dec. 1, 1888, the records show that the aggregate sessions of the Superior Court, in the trial of civil and criminal cases, occupied 790 days, scarcely more than one third of the time of the judges of that court, if they, unassisted, did the whole of the service.

Agriculture.—In this State nearly 45,000 persons, and more than \$135,000,000 of capital, are employed in agriculture. The changed condition occasioned by the development, within a few years, of railroad transportation, compels the farmer of New England to avoid competition with the cheap lands of the West, by giving attention to such lines in his occupation as require special knowledge and skill. To assist in sustaining in Connecticut such a policy, bounties have been given to agricultural societies; an experiment station has been established, the first in the country; and the Storrs

Agricultural School, for the special education of farmers, has been assisted by annual appropriations of money.

Fish-Culture and Shell-Fisheries.—The action of the State in creating commissions to supply the lakes, rivers, and streams with a variety of fish, and to promote the cultivation of oysters, has been productive of the most satisfactory results. The Shell-fish Commission has, within a few years, developed an industry that gives employment to a large number of men, involves large amounts of capital, and promises to continually increase its proportions.

The Fish Commissioners express the opinion that the present modes of fishing in Connecticut river are so destructive as to threaten the speedy extermination of shad, and in their annual report they call upon the Legislature to investigate the matter of the pollution of the rivers and streams of the State by refuse matter from mills and factories.

The commissioners review with regret the temporary failure to secure a permanent restoration of the salmon to its old haunts in the State. In 1874 New Hampshire, Vermont, Massachusetts, and Connecticut combined together and placed in the tributaries of the upper Connecticut about 1,000,000 young salmon. In 1878, as was anticipated, the salmon appeared in considerable numbers, averaging about fifteen pounds each; but, as it was a very large and valuable fish, nearly all that entered the river were taken. A few succeeded in making their way up to the foot of Holyoke Dam, but were there stopped by this impassable barrier. The result has been the disappearance of the salmon, never to return until a practicable fish-way shall be erected at the Holyoke Dam.

Charities.—The State has, during the year, wholly or partially, cared for 2,712 persons in its hospitals and other humane institutions, at a total expense of \$257,261.17; and the people have, it is estimated, at the same time contributed, in local taxation, to the same class of charities more than \$500,000.

The Insane Hospital at Middletown is intended to accommodate only 775 patients; but at no time during the year were there fewer than 842, while the average number was 854. The hospital comprises several cottages, besides the main building and annex.

The results of the school, established at Middletown, in 1869, for the care and training of friendless and neglected girls, have been exceedingly gratifying. The statistics show that more than two thirds of its wards, in number not less than 500, have been saved from a life of degradation and vice. During the year there were 48 commitments, and 54 girls were placed in country homes or among relatives. There are now in the school 192, between the ages of eight and nineteen, disposed of in families, occupying five separate buildings.

License Law.—The returns of county commis-

sioners show that 2,971 licenses were issued during the year, the total receipts from which amounted to \$263,073.94. There is more popular contentment now than ever with the general provisions of the law relating to the manufacture and sale of intoxicating liquors.

Election.—On the 6th of November there were elected twelve State Senators, a full House of Representatives, and eight sheriffs. A sheriff in each county was chosen, and Senators in the odd districts. Five Republican sheriffs were elected (Hartford, New Haven, Middlesex, New London, and Windham counties) and three Democrats (Tolland, Fairfield, and Litchfield counties). Ten Republican and two Democratic Senators were elected. The legislature of 1884 will be constituted as follows:

	Republicans.	Democrats.	Majority.
Senate.....	15	9	6
House.....	154	95	59

CONVALLARIA MAJALIS. Recent experiments with this drug seem to have established the following points: Its use is especially indicated in organic disease of the heart, with feeble pulse and decrease in the energy of its action; to lower the temperature of the body, to diminish the hyperæmia of the nervous centers, increase arterial tension, promote the action of the kidneys, and lessen the reflex action of the nerves. It is contraindicated in cases of gastric and intestinal derangement, in acute affections of the liver, kidneys, or spleen, in pregnancy, and in fatty degeneration of the heart. Its physiological actions, as tested upon animals, are as follow: On the brain it causes a tendency to somnolence, resulting from anæmia of the nerve-centers. On the kidneys it causes marked increase in function. Placed in direct contact with muscular tissue it completely destroys its contractility. By its action on the alimentary canal in large doses it causes salivation, vomiting, and increase in the natural muscular movements. It first causes a slight increase, and then a more decided decrease, in the animal temperature. On the respiration it has a somewhat analogous effect, first increasing the frequency, then causing a decrease, and finally complete cessation.

COOPER, Peter, an American philanthropist and merchant, born in the city of New York, Feb. 12, 1791; died there, April 4, 1883. On his father's side he was of English origin. Both his grandfather and his father were soldiers in the Revolution. His maternal grandfather, John Campbell, a successful potter in New York, did good service in the Board of Aldermen, and gave liberally of his means in the interests of his native land. The father of Peter Cooper was a hatter, and on the return of peace, in 1783, resumed his business in New York. Peter was the fifth of nine children, having six brothers and two sisters. As his father's means were limited, the lad received but few advan-

tages in the way of schooling. At the age of seventeen he became an apprentice in a carriage-factory, and served his full time. He manifested a talent for inventions, and also adopted as a maxim for his future course, never to be in debt. The next two years of his life he spent in a woolen-factory at Hempstead, Long Island, where he invented an ingenious machine for shearing the nap from cloth. It had a rapid sale during the war of 1812, and yielded the inventor a large profit.

In 1818 he married Miss Sarah Bedel, of Hempstead. For a time he was engaged in cabinet-making; then he opened a grocery, and next purchased a glue and isinglass manufactory. This last business, in his hands, became very profitable, and was continued by him for half a century. Mr. Cooper's attention was early directed to the vast resources of the United States for the manufacture of iron, and in 1830 he erected extensive works at Canton, near Baltimore. Subsequently, he built a rolling and wire mill in the city of New York, where he first successfully applied anthracite coal to the puddling of iron. While in Baltimore he built, after his own designs, the first locomotive-engine constructed on this continent, and it was used successfully on the Baltimore and Ohio Railroad. In 1845 he removed the machinery to Trenton, N. J., and erected the largest rolling-mill at that time in the United States. In these works he was the first to roll wrought-iron beams for fire-proof buildings, and he used them afterward in his great monument, the Cooper Union in New York. He took into partnership with him his son Edward, and his son-in-law, Hon. Abram S. Hewitt, and the firm subsequently embraced in its operations large mines of ore and coal, quarries, forges, blast-furnaces, wire and rolling-mills, chain, horseshoe, and open-hearth steel works.

In the development and putting to practical use this great element in our national progress, as well as in the progress of the human family, Peter Cooper took a large share, and his name will be long honorably remembered in connection with the iron and coal industry.

The laying of the Atlantic cable was planned by him, and accomplished by his persistent efforts, even when his associates were discouraged and ready to give up in despair. Ten or twelve years of toil under difficulties which few men are able to overcome, of public ridicule, of refusal of capitalists to invest anything in it, of heavy outlays, and of apparent failure at the last, when the cable parted and sank to the bottom of the Atlantic—ten such years show the stuff of which Peter Cooper was made. In due time he reaped his reward. The same courageous and hopeful spirit was displayed in various other ways when Mr. Cooper was a member of the New York Common Council, when he urged the construction of the Croton Aqueduct, and when acting as a trustee of the

John C. Smith

Public School Society, and as one of the commissioners of the Board of Education.

Having devoted much careful thought and study to questions of finance and good government, Mr. Cooper made his views widely known; and the result was that, when he was in his eighty-sixth year, he was nominated by the National Independent party as their candidate for President of the United States. But the number of those who agreed with him as to the currency question (commonly called "Greenbackers") was small.

Mr. Cooper's career was not marked by brilliant exploits of genius or intellectual superiority, or by any of those startling performances which attract the admiration of mankind. He was an honest, industrious, faithful business man, ever advancing in prosperous undertakings, and at the same time keenly alive to all matters relating to public interest and public improvement. He amassed great wealth, and his aim was to use his large resources for the benefit of his fellow-creatures. Instead of waiting for the time when he could keep his hold on his wealth no longer, he chose to be his own executor, and to devote his money to the purposes he wished, while he was alive and able to secure their proper carrying out. He had always lamented his lack of liberal education, and the resolve seems early to have fixed itself in his mind to do all in his power to provide advantages and opportunities for culture to the working-classes of his native city. From this impulse arose that institution which has endeared his name and memory to thousands. He first secured an admirable site at the junction of Third and Fourth avenues, between Seventh and Eighth streets, with full light on all its four sides. From his own plans was erected the imposing structure known as "The Cooper Union for the Advancement of Science and Art." He superintended the rise of this massive building, and spared no expense to render it all that could be desired. On its completion, Mr. Cooper, in April, 1859, executed a deed in fee simple of this property to six trustees, who were empowered to devote all rents and income from it "to the instruction and improvement of the inhabitants of the United States in practical science and art." After due consideration, the trustees fixed upon a scheme which should "include instruction in branches of knowledge by which men and women earn their daily bread; in laws of health and improvement of the sanitary conditions of families as well as individuals; in social and political science, whereby communities and nations advance in virtue, wealth, and power; and finally in matters which affect the eye, the ear, and the imagination, and furnish a basis for recreation to the working-classes." Courses of lectures were established on social and political science, free to all; also, a free reading-room and collections of works of art and science were provided, and a school for instruction of women in the arts of design, by which they

may gain an honorable livelihood. Still further, so soon as funds are in hand, the trustees purpose to establish a polytechnic school.

According to the last annual report of the Cooper Union, the building cost \$680,000; and the total expenditures of the trustees on the building and education, from 1859 to 1882 inclusive, have been \$1,603,614.17. In 1861 pupils who received certificates numbered 272; in 1882 the number reached as high as 955. In 1860 the number of teachers employed was 16; in 1882 it was 86. In 1860 the number of readers in the reading-room was about 250,000; in 1882 it was 476,000. In 1860 the expenditure was \$30,800.71; in 1882 the expenditures amounted to \$54,421.42. The income is chiefly derived from the rents of such parts of the building as are used for business purposes, and from an endowment by Mr. Cooper of about \$200,000. The founder's children will add to this the sum of \$100,000, in addition to the bequest of \$100,000 in his will.

The last days of Peter Cooper were calm and peaceful. He was a devout member of the Unitarian denomination. The last sad offices for the dead were very largely attended, and the manifestations of grief at being called upon to part with one so universally respected and so widely beloved were striking and impressive. Shortly before his death was printed a volume entitled "Ideas for a Science of Good Government, in Addresses, Letters, and Articles on a Strictly National Currency, Tariff, and Civil Service. By Hon. Peter Cooper, LL. D."

COREA (officially called Chosen), a kingdom of Eastern Asia, occupying the peninsula opposite the Japanese island of Nippon and bordering on the Chinese province of Manchuria. The King of Corea acknowledges the nominal suzerainty of China, but has for ages preserved a practical independence. The country still pays a tribute to China, but the amount has been reduced to a nominal sum. An embassy visits Peking every year with certain prescribed gifts, and receives in return the Chinese calendar, which is accepted and employed by the Coreans as a sign of dependence. On the accession of a new King, the Chinese Emperor is notified, and his sanction for the investiture is obtained.

At different times the country has been overrun by both the Chinese and the Japanese. The suzerainty of China was accepted the last time as a protection against the Japanese, who threatened to subjugate the country, claiming suzerain rights, which were resisted by the Coreans, based upon a conquest in the early part of the Christian era. The object of the Japanese invasions, which were the occasion of accepting vassal relations to China, was to use Corea as a base of military operations against China, and the motive for acknowledging Chinese suzerainty was to avoid the claims of supremacy asserted by Japan. The Japanese Government has never renounced its title

to suzerainty, and after the invasion maintained a garrison in Fusan, kept that place open to Japanese trade when intercourse was broken off with all foreigners, exacted for a time an annual tribute, and exerts to this day a certain measure of political control. The relations with China, established for purposes of mutual protection, have continued to bear the character of a friendly alliance, in which the condition of vassalage is treated simply as a matter of form. For two hundred years China has avoided complications with Corea, and has never materially interfered with her affairs. In the treaty of commerce between the United States and Corea, the first clause contains a recognition of the sovereign rights of China over Corea, which became important again and mutually advantageous when it was feared that Russia or some other European power might seek to establish a protectorate.

In consequence of the Japanese and Manchu invasions which devastated and depopulated the country, the Korean Government adopted a policy of complete non-intercourse with foreigners. The mineral industries were purposely neglected, and the wealth of the country in gold and silver was kept concealed by means of rigorous laws against mining, so as to avoid presenting temptations to new conquerors. This policy of seclusion is the cause of the stagnation and backwardness of the country, and has kept the people in a condition of poverty. The population of Corea is estimated at 11,000,000, and the number of habitations at 1,700,000.

Government.—The reigning King is Li Fin, the twenty-eighth successor in a line which has reigned for 492 years. The King is an absolute monarch. He has three ministers who hold office for life. There are six governmental departments, which have cognizance respectively of the appointment and dismissal of subordinate officers; the supervision of finances, taxation, and coinage; the government of schools, the examination of literary candidates, and the regulation of ceremonies; the army, manufacture of arms, and postal affairs; the supervision of courts and the administration of justice. The heads of departments are associated with the three chief ministers in the Council of State, which makes a daily report to the King of the results of its work. The official class constitutes the nobility. There are no hereditary titles, and though the aristocratic families preserve their power and distinction, each man's rank is derived from the highest office he has held. The attachment of rank-distinction to official posts is the cause of frequent changes in the offices, in order that the titles of rank may be multiplied, and the cause also of fierce rivalry between the different families of the upper class for these posts and their division into factions which keep up a constant turmoil. Officials possess certain special privileges, such as immunity from arrest. They can only be summoned into court

on a writ from the Department of Justice. The system of appointment is similar to that which prevails in China. Literary examinations are held at stated intervals, and three classes of diplomas are awarded to the successful candidates, which make them eligible to appointment in the corresponding grades of official position. The common people take very little part in public affairs.

The Army.—The army consists of a militia, in which 1,800,000 are enrolled; but this military force is not effective, as the men are not drilled and have no arms.

Education.—There are numerous private schools, but no public system of education. Nearly all of the common people can read and write in the Korean language, in which many simple books are printed. The language of learning is Chinese, in which the upper classes receive their literary education. After the opening of the country to foreign intercourse by the American treaty, the Government established an English school at Seoul, the capital. The teachers were at first Chinese, educated in the United States. Subsequently Europeans were engaged.

Customs and Institutions.—The titles to land are derived from the Government, and are carefully registered in public records. The tenure depends on the payment of taxes, which are levied in kind, and are an oppressive burden on account of the extortions of officials. The only coin in use is the copper cash, of which 525 are equivalent to a Mexican dollar. The roads are narrow and are unfitted for vehicles, except the two-wheeled carts used to transport merchandise. Bulls and Korean ponies are used as pack-animals. The wealthy travel on horseback or in sedan-chairs.

Post-offices are maintained in the principal towns, and on some of the highways the Government provides post-houses for public use.

The majority of the houses are only huts, with mud walls and floors and thatched roofs. The houses of the well-to-do have stone foundations and flues running through them, which serve as stoves. The building itself is of wood, with a tiled roof. The floors, walls, and windows are lined with paper.

The clothing of the common people is of cotton or linen cloth. They are shod with sandals made of straw or twine, with soles of rawhide. Their conical hats are made of horsehair. Their leg-coverings are wide trousers divided below the knees and fastened about the ankles. Their coat is a long, loose tunic, with flowing sleeves. Their winter clothing is wadded.

A modified form of bondage exists. Sometimes people voluntarily enter the servile state in order to escape extortion and oppression. The artisans and laborers belong to powerful guilds, which enable them to maintain a considerable degree of comfort and independence. The wages earned by laborers average about

fifteen cents a day, and by artisans about twenty-five cents. The chief domestic industries are the manufacture of silk, cotton and linen cloths, stoneware and porcelain, hats, shoes, paper, mats, fans, screens, combs, pipes, brushes, tiles for roofing, furniture, and tools for mechanical and agricultural uses. Cloths are woven by hand, and pottery is made on the wheel. With the exception of some handicrafts peculiar to the country, in which a high degree of skill is exhibited, most of the productions are rude and primitive. From specimens of old bronze and porcelain, it is evident that in former ages a higher stage of art and skill existed. It was the Koreans who introduced art and learning into Japan, and the Japanese affirm that at the period of the last emigration all the best workmen, driven away by war and desolation, settled in their island.

Commerce, Products, and Resources.—Corea is a mountainous country. From the Shanyan-alin range, which extends along the western coast from north to south, smaller ranges project, which extend to the opposite shore. In the western and central parts of the peninsula are several plains which are exceedingly fertile. The country is well watered, and in many parts well wooded. The climate of Corea, though the winters are severe in the north, in general resembles that of Southern Europe. The vegetation is exceedingly rich. Besides many flowers which are peculiar to the country, a great number of flowering plants which are cultivated in Europe grow wild. Among the trees are three of commercial value—the cork-oak, the mulberry, and the lac-tree, from which a golden-yellow gum of the finest quality is obtained. The rich soil brings forth every kind of fruit and grain. Cotton is raised easily, and is found growing wild in many spots, even in the mountains. Other products are hemp, flax, tobacco, madder, and indigo. The most important is the Korean ginseng, prized above all other varieties. The occurrence of this root in the country is partly the cause of the idleness and spirit of wandering and adventure which pervade Korean society. The finest quality brings \$1,500 a pound in the Chinese market.

The mineral wealth of the country surpasses even its extraordinary agricultural resources. The mines which were worked in former centuries have been abandoned, except a few, which are exploited in an inefficient manner by the Government. The quest and digging of the precious metals is forbidden on pain of death. Of late years these laws have been executed with the greatest rigor, but the temptations to break them are so strong that considerable quantities of gold are smuggled out of the country. This metal, as well as silver, is found in all parts of Corea. In the middle and northern provinces there are many streams whose beds are rich in gold-dust. The region next to the Russian boundary has valuable coal-beds and copper-mines, and contains sulphur, arsenic,

quicksilver, lead, tin, and iron, and also beautiful varieties of marble and granite.

Of the domestic animals, the cattle are well bred, and would compare favorably with those of the United States. Bulls and cows are used as beasts of burden. The horses are of a diminutive race, and poor in quality. The swine are also inferior. Goats and sheep are not often seen.

The commerce with Japan constituted the entire foreign commerce of the country up to the time of the opening of treaty-ports by the recent treaties. The Japanese were allowed only in a few places, none of them near the capital, and were subjected to harsh restrictions. Seven ninths of the commerce was with the remote port of Fusan. The total value of the trade with Japan increased from 348,000 yen in 1877 to 3,827,000 yen in 1881, aggregating for the five years 9,078,000 yen. Most of the articles sold to the Koreans were of European manufacture. The total imports for the five years were valued at a little more than 4,000,000 yen. Nearly half consisted of cotton goods, chiefly shirtings, which were imported to the value of over a million yen in 1881. The goods were almost entirely of English manufacture. This trade is capable of expansion, as the Koreans grow but little cotton and possess only rude hand-loom. Besides shirtings, cambrics and lawns found a demand. There was also a market for drugs and dye-stuffs. The chief article of Japanese production imported was copper, from which the clumsy currency of the country is made. The Japanese merchants, in the absence of any medium of international exchange, conducted their trade chiefly by barter. Japanese porcelain, copied exactly from Korean ware, is imported in quantities and is preferred to the domestic product. Tobacco is another leading article of import. The most important staple exported is rice, for which there is always a demand in China, and at present prices in Japan. Rice is sold in Corea at about one third the price it brings in Japan. Gold comes next, of which, in spite of the prohibition, there were nearly 1,000,000 yen exported in the five years. Hides are the next largest export article, and then peas of the kind from which the "bean-cakes" of Northern China are prepared. A coarse stuff from which the clothing of women of the poorer classes in Japan is made, raw silk and pongee, sea-weed, *bêche-de-mer*, silver, dried fish, and ginseng were the other exports. The trade is carried on chiefly in steamers that arrive at Fusan and at Gensan, which is one of the largest cities, once or twice a month. The commerce of the five years employed 401 steam and sailing vessels of European build, having a total capacity of 60,000 tons, and 1,700 junks of 20,000 tons.

Great expectations have been raised in Europe and America of the trade which may be developed with "the hermit nation" after the opening of its gates to foreign intercourse.

The Government of Corea is disposed to encourage the trade for the revenue it will yield. One of the plans for developing commerce is a museum of articles of foreign production, such as machinery, mining and agricultural implements, and all classes of fabrics which merchants and manufacturers will send to be put on exhibition, in the hope of finding a demand in Corea. According to the report of the naval officers who accompanied the German embassy which concluded the treaty of commerce, the foreign trade of Corea is not capable of assuming any considerable dimensions. The people are described as having few and simple wants, and not inclined to work more than is necessary to satisfy their moderate requirements. They are said to lead in general a poor life, and are depicted as indolent and uncleanly compared with the Japanese; and lacking the diligence of the Chinese. They say that agriculture and cattle-growing are the chief and most profitable employments, and describe the land as being fertile and well cultivated.

The importation of shirtings of coarse quality is the only trade which is likely to develop rapidly. This will fall to the English, unless American manufacturers are able to compete with them. For the Korean rice and for the timber existing in large forests near the sea, there is a market close at hand in Japan and the north of China.

Commercial Relations.—The treaty of commerce with the United States, signed in 1882, was ratified in 1883. In this and the provisional treaties made with England and Germany the Korean Government was allowed to levy an import duty of 10 per cent. on articles of necessity, and 30 per cent. on articles of luxury. Pressure was brought through the Japanese Government to have the scale altered to a general tariff duty of 5 per cent., the same rate as in the existing treaties between China and Japan and the Western powers. This limitation was exacted of China and Japan by force, and it was expected that they would support Corea in her desire to establish the higher scale from motives of policy, in order to obtain more liberal terms for themselves when their treaties came to be revised; but the wishes of the Western powers have, as usual, prevailed. The Korean duties are payable in Mexican dollars or Japanese silver yen, instead of in the inconvenient Haikwan tael of variable standard. A Korean embassy arrived in the United States in September, 1883.

COSTA RICA. The President of Costa Rica is Don Prospero Fernandez; Vice-Presidents, the ministers Señores E. Figueroa, V. Guardia, B. Soto, and M. Guardia. The Cabinet was composed as follows in 1883: Minister of the Interior, Charitable Institutions, and Worship, E. Figueroa; Commerce and Finance, B. Soto; War and Navy, M. Guardia; Interior and Justice, V. Guardia; President of Congress, Señor J. M. Carazo; Secretaries, V. C. Segreda and

J. Solano; President of the Supreme Court, Dr. R. Orozco; commander-in-chief of the army, Gen. H. Duran.

Finance.—In the budget estimates for the fiscal year ending April 30, 1884, the gross revenue and expenditures were set down as follow:

REVENUE.	
From customs.....	\$574,000
From monopolies (spirits and tobacco).....	746,000
From postal service, telegraphs, national printing-office, railroads, etc.....	165,900
From direct taxation.....	101,000
From sundries.....	825
From unforeseen income.....	20,000
Total.....	\$1,807,425
EXPENDITURE.	
Department of the Interior.....	\$172,574
" Police.....	86,222
" Finance and Commerce.....	174,859
" Justice.....	87,561
" War.....	252,449
" the Navy.....	88,900
" Public Works.....	841,441
" Public Instruction.....	180,110
" Public Worship.....	19,240
" Public Charities.....	1,600
" Foreign Affairs.....	86,890
" Collection of internal revenue, and payments on account of internal debt.....	1,167,624
Total.....	\$2,504,180
Deficiency.....	696,705

Public Debt.—The final treasury accounts for the fiscal year ended April 30, 1880, stood as follows: Liabilities: Public debt, \$6,258,629, of which foreign indebtedness, \$5,463,265; bills of exchange due, \$176,886; paper money issued, \$105,915; sundry consolidated debts, \$161,682; internal loan, \$140,774, and floating indebtedness, \$210,087. Assets: \$10,918,062, of which public improvements such as railroads, etc., \$10,281,778; tobacco and spirits in warehouses, \$155,821; deposits in banks, \$156,783; money due by municipalities, \$30,805; and other outstandings, \$298,370.

In 1883 the foreign debt of Costa Rica amounted to £3,276,000, on which no interest had been paid since 1874; quoted on the London stock exchange, those of the loan of 1871 (£940,800) at 17 and 19, and those of 1874 (£2,335,700), at 13 and 15 per cent. President Don Prospero Fernandez has now made a proposition to Mr. Minor C. Keith to make, if feasible, an arrangement with the foreign bondholders, by pledging the customs revenue for coupons due and not paid, and for the creation of a sinking fund for the eventual liquidation of the capital. After the arrangement is perfected, Mr. Keith is to procure a \$6,000,000 loan to complete the principal railway line.

Customs collected.—1876-'77, \$557,407; 1877-'78, \$846,691; 1878-'79, \$921,406; 1879-'80, \$800,957; 1880-'81, \$647,808.

Railroads.—The following lines of railroad are in operation: Alajuela-Cartago, *via* Heredia and San José, 43 kilometres; from Punta Arenas to Barranca, 14 kilometres; and from Limón to the Rio Sucio, 113 kilometres; together, 170 kilometres. The gross earnings in 1882-'83 were \$52,931; the expenses were \$82,857.

Telegraphs.—There are in operation 727 kilometres, the service being performed by 16 offices. The lines are the following: 1. From Cartago to the Nicaraguan frontier *via* San José, Heredia, Alajuela, Esparza, with branch lines to Grecia, San Ramon, Punta Arenas, Taboba, Liberia, Santa Cruz, and Nicoya (576 kilometres). 2. From Limon to San José (151 kilometres). Number of messages in 1882-'88, 27,589, of which inland private, 18,982; for countries abroad, 1,304; Government messages, local, 7,248; beyond the country, 55. Income, \$4,940; expenses, \$17,718.

Postal Service.—The income from postal service in 1882-'88 was \$50,000; the outlay, \$80,000.

Commerce.—Of the 386 vessels that entered Costa Rican ports in 1883, 21 were navigating under the Costa Rican flag; 213 hailed from other Spanish-American countries; 39 were American, 30 British, 14 German, 12 French, and 7 of other nationalities.

In 1882 there entered the port of Punta Arenas 100 vessels, 79 being steamers, 4 ships, 3 barks, 13 brigs, and 2 schooners; 79 being under the American flag, 7 French, 5 English, 2 Italian, 1 Danish, 1 Norwegian, and 5 German; the aggregate tonnage being 168,528. Limon, on the Atlantic, has been declared a free port for ten years to come.

The imports in the fiscal year 1879-'80 *via* Punta Arenas amounted to \$2,669,861; *via* Limon during the first four months of 1880, \$138,500; the exports through Punta Arenas, \$3,524,810 during twelve months, and through Limon, four months, \$211,142.

The chief articles exported from Punta Arenas were: Coffee, 28,266,196 pounds, worth \$3,436,085; hides and skins, 276,279 pounds, \$50,808; India-rubber, 26,319 pounds, \$10,890; and other goods, re-exports, comprised \$27,732.

The trade between the United States and Central America in 1879-'83 was as follows:

FISCAL YEAR.	Imports.	Exports.
1879.....	\$2,251,539	\$1,110,608
1880.....	2,312,480	1,739,215
1881.....	2,159,736	1,541,239
1882.....	4,735,398	1,596,563
1883.....	5,191,315	1,986,313
Total.....	\$18,581,557	\$7,904,413

IMPORT OF CENTRAL-AMERICAN COFFEE AND INDIA-RUBBER INTO THE UNITED STATES.

FISCAL YEAR.	Coffee.	India-rubber.
	Pounds.	
1875.....	18,868,955	\$181,170
1879.....	11,463,186	106,672
1880.....	19,254,219	257,891
1881.....	15,858,337	467,370
1882.....	22,449,113	1,037,015
Total.....	82,908,748	\$1,990,119

CUBA. The area of this Spanish West India island is 43,220 square miles, and the population, which, according to the census of 1862,

counted 1,859,238 souls, was shown by the last census (1882) to have increased to 1,521,684, of whom 850,520 were males and 671,164 females. The six provinces into which Cuba is divided comprise 33 "partidos judiciales" and 180 "ayuntamientos." The province of Havana counted 485,896 inhabitants; that of Santa Clara, 321,397; Matanzas, 288,121; Santiago de Cuba, 229,321; Pinar del Rio, 182,204; and Puerto Principe, 69,245.

The most populous ayuntamientos are: Havana, 198,721 inhabitants; Matanzas, 87,760; Santiago de Cuba, 71,307; Cienfuegos, 65,067; Puerto Principe, 46,641; Holguin, 84,767; Sancti Spiritus, 82,608; Guanabacoa, 29,789; Trinidad, 27,654; Manzanillo, 28,208; Santa Clara, 22,781; Pinar del Rio, 21,870; and Colon, 20,898.

The male portion of the population is composed of 571,766 Spaniards, 7,944 white foreigners, 46,698 Chinamen, and 252,660 colored people. The female portion comprises 430,195 Spanish, 3,216 foreign, 84 Chinese, and 242,320 colored females. This gives a total of 998,961 persons of Spanish origin, 11,260 of foreign, 46,872 Chinese, and 494,980 colored.

Army.—The commander-in-chief and Captain-General of the island is Don Ignacio Maria del Castillo, born at Jalapa, Mexico, Feb. 9, 1817. He arrived from Spain at Havana on Sept. 28, 1883, to take charge of this port.

The strength of the Spanish forces in Cuba, by decree of the Minister of War at Madrid, was fixed for 1883-'84 at 25,653 men.

Finance.—In 1878 Captain-General Martinez Campos, after making the arrangement with the insurgents at Lanjon, issued a decree virtually suspending payments from the Cuban Treasury up to July 1st of that year, and since then no steps have been taken to liquidate the indebtedness, the annual interest on which amounts to \$7,000,000. An issue of paper money has been made to the amount of \$60,000,000, and the premium on Spanish gold fluctuates wildly at times; this depreciated currency renders living dear as it has been at all times, still more expensive.

Subsequent to the collapse of the insurrection, a tax law was passed, which created eleven kinds of taxation: (1) on the transfer of property by inheritance, etc., of $\frac{1}{4}$ to 8 per cent., estimated to produce \$1,091,000 per annum; (2) direct taxes (income-tax) of 16 per cent. on the profits cleared by residents of cities, and 5 per cent. on sugar and tobacco planting; receipts under this head being estimated at \$6,335,800; (3) on railway-traffic, to produce \$1,000,000; (4) on slaughtering, \$592,800; (5) on passports, \$850,000; (6) import and export duties, and ship-dues, \$21,859,400; (7) indirect taxes, such as stamp-dues, \$3,488,800; (8) on lotteries, \$3,477,000; (9) on the salaries of Government officers; (10) a tax of \$12 a head which the owner of liberated slaves has to pay if he retains them for domestic service, \$500,000; (11) a tax of 5 per cent. on the

budgets of all municipalities, \$412,500. In August, 1883, the "Gaceta Oficial" of Havana contained the following details of a dispatch from the Minister of the Colonies, Madrid, to the Captain-General of Cuba:

All country property now pays 2 per cent., without distinction. The reduction last year was granted only to those cultivating sugar and tobacco. The sur-tax on export duties is reduced from 10 per cent. to 5 per cent. from July 1st. The duties on tobacco exported from the Central and Oriental Departments have been reduced 30 per cent. The additional tax on all drinkables has been abolished and in place of it has been imposed a tax of 2 cents per litre for casks and 3 cents per litre for bottles and jars. The municipality has been authorized to raise 50 per cent. on this tax.

This latter tax in reality substituted a 22 per cent. tax for what was 15 per cent. before.

The budget for 1881-'82 estimated the expenditures at \$34,635,848.

The previous year had left a deficit of \$20,000,000. The year before had left a surplus of \$3,867,950.

The budget estimate for the fiscal year 1882-'83 stood: income, \$34,442,979; outlay, \$34,626,910.

Paper money (bank bills) is destroyed at stated periods, in moderate amounts (\$200,000 on Aug. 31, 1883), in accordance with the law of amortization of July 7, 1882.

According to the new budget law, the administration-general of the Treasury of the island of Cuba has been changed into a general intendency at Havana, with six sub-intendencies at Havana, Pinar del Rio, Matanzas, Santa Clara, Puerto Principe, and Santiago de Cuba.

According to a statement published at Havana in August, 1883, the royal lottery produced, during the last fiscal year, net profits amounting to \$5,302,519, against \$5,295,679 during the previous year. In 1882-'83 the administration drew with the unsold tickets, \$948,100, against \$1,910,400 in the preceding year. In the five lotteries drawn since July 1, 1881, there remained unsold 139 tickets on July 1, 1882, which was equivalent to a loss of \$548,280 to the treasury.

On Nov. 14, 1883, the Cuban treasury, on authorization from the home Government, secured from the Spanish Bank of Cuba a loan of \$500,000 for six months, at the rate of 7½ per cent. interest per annum.

Havana Gas Companies.—At a meeting of shareholders of the two gas companies of Havana, on Aug. 31, 1883, the proposition made by Señor Dorilla on behalf of several New York capitalists, to lease the works of the two companies for a term of twenty years, was accepted, the shareholders of the "Española" to receive 5 per cent. net yearly.

Emancipation.—On Nov. 15, 1883, the "Gaceta Oficial," of Havana, published a royal decree ordering that all doubts concerning the application of any part of the law of gradual abolition of slavery shall always be

resolved in the sense of the widest latitude for the liberty of the slave; and that, therefore, owners of slaves, when the latter have acquired their freedom, shall not compel them to pay indemnities for their children. The decree argues that the law orders that under no consideration shall the families of slaves be separated; and that if parents were obliged, when freed, to pay for the rescue of their children, other sections of the law providing for gradual abolition would be violated.

News was received from Havana in November, 1883, that the new Captain-General endeavors to carry out the recommendations of the Liberal party in Cuba to do justice to the 30,000 slaves illegally held in bondage since 1870. He was also taking active steps to ease the situation of the Cuban treasury, consolidate the floating debt, and carry out fiscal reforms.

Immigration.—Quite a movement was set on foot by Señor Isabal, on the occasion of the meeting of the Geographical Congress, at Madrid, during the latter part of 1883, to promote white emigration from Europe and the Canary Islands to Cuba; and this movement has met with a hearty response from Santiago de Cuba, where planters, merchants, and manufacturers met on Oct. 8, 1883, and took the necessary measures toward co-operating with their Peninsular colleagues.

Railroads and Telegraphs.—In 1880 there were in operation 871 miles of railway. The length of telegraphs in operation was 2,835 miles, and the number of offices 187.

Political and Economical Status.—The surrender at Lanjon, Feb. 10, 1878, terminated the insurrection on the island after a ten-years' war, during which, according to the estimate of Captain-General Don Joaquin Jovellar, 200,000 combatants perished by the sword and disease, and the cost to Spain and Cuba was \$700,000,000. The strife ruined entire provinces; those of Santiago de Cuba and Puerto Principe, even in 1883, still presented a painful spectacle of impoverishment and desolation. In August, 1879, a fresh rising took place, and was quelled less by the Government forces than by public opinion and the firm and resolute attitude of the Liberal Autonomist party. The basis on which the capitulation of Lanjon had been agreed to, embraced the following conditions: The island of Cuba is granted an organic political and administrative régime equal to the one which rules the island of Porto Rico; complete amnesty and liberation of all slaves and Asiatic colonists who fought in the ranks of insurrection; Cuba to be permanently represented in the Cortes by her own deputies duly elected, and thus to recover the privilege of which she had been deprived in 1836. This revival of political life caused the formation of the now existing parties in Cuba. In August, 1878, the so-called Liberal party was organized, most of whose members are creoles. Its programme is the immediate, sweeping aboli-

tion of slavery, now disguised under the name of "Patronato"; the fostering of white immigration by families, but left to private initiative; the granting of the usual necessary liberties; independence and decentralization in municipal and provincial affairs; the autonomy of the colony, that is, its own administration and free voting of taxes; finally, free trade.

In order to oppose this Liberal-Autonomist party, the "Constitutional Union" was formed, mostly made up of Spaniards. It has for its object: To preserve as long as possible compulsory labor; to endow the colony with a political and administrative *régime* analogous to that of the Peninsular provinces; and finally to maintain the system of protection.

The struggle between these two parties in Cuba is most lively, especially as the Conservative party accuse the Liberals of being the enemies of Spain, and treat them as such. The Government is not an altogether passive spectator of this political strife, but invariably leans toward the Constitutional Union, to the detriment of the Liberal Autonomists.

The prosperity of young societies known by the names of colonies is dependent upon three conditions: 1. The right of self-administration. 2. A good method of acquiring land and a system of succession which, while it favors the equality of conditions, facilitates a rapid transfer of property and stimulates the occupant of the soil to cultivate and improve it. 3. Moderate taxation—in other words, cheap government.

Cuba does not yet possess the right of self-administration, power concentrating in the hands of the Captain-General and of the Minister of the Colonies. This administrative centralization is felt throughout the details of local existence and does not allow the vitality of the country to find full scope, which is indisputably a great drawback. There is the pressure on society of a numerous bureaucratic army, devoid of fixed interests in the island. With few exceptions, these office-holders are native Spaniards. The fall of a cabinet in Madrid frequently involves the dismissal of numerous officers in the ranks of the administration, to be replaced, not by individuals competent for their new employ, but by those who belong to the victorious party at home. This abuse has come up for debate in the Cortes, and grave revelations of immorality in financial matters have been made relating to the local administration of Cuba, causing the Minister of the Colonies himself to promote radical reform.

The annual message of the President of the United States, of December, 1883, contains the following passages:

It is understood that measures for the removal of the restrictions which now burden our trade with Cuba and Porto Rico are under consideration by the Spanish Government. The proximity of Cuba to the United States, and the peculiar methods of administration which there prevail, necessitate constant discussion and appeal on our part from the proceedings of the insular authorities. I regret to say that the

just protests of this Government have not as yet produced satisfactory results.

I have alluded in my previous messages to the injurious and vexatious restrictions suffered by our trade in the Spanish West Indies. Brazil, whose natural outlet for its great national staple, coffee, is in and through the United States, imposes a heavy export duty upon that product; our petroleum exports are hampered in Turkey and in other Eastern ports by restrictions as to storage and by onerous taxation. For these mischiefs adequate relief is not always afforded by reciprocity treaties, like that with Hawaii or that lately negotiated with Mexico, and now awaiting the action of the Senate. Is it not advisable to provide some measure of equitable retaliation in our relations with governments which discriminate against our own? If, for example, the Executive were empowered to apply to Spanish vessels and cargoes from Cuba and Porto Rico the same rules of treatment and scale of penalties for technical faults which are applied to our vessels and cargoes in the Antilles, a resort to that course might not be barren of good results.

United States Commercial Agent Ford, of Sagua la Grande, in a report on the carrying-trade between that port and the United States, says that if, during the next four years, "American tonnage continues to decrease and English steam tonnage to increase at its present ratio, the American flag will be seen only above the United States consulate, and the chief business of the consular office will be merely to give certificates of invoices and to draw bills of health for British steamers." In regard to discrimination against American vessels and in favor of British vessels, Mr. Ford makes the following comparisons, and offers the following suggestions as remedial measures:

In my judgment, it would be an act of wisdom in our law-makers should they abolish all consular fees now paid by American vessels, excepting those for noting and extending protests; and it would also be well to annul the law allowing three months' extra pay when a seaman is left in the hospital. The other section relating to the three months' extra wages is a just and equitable statute, and should continue in force. To abolish that would entail endless annoyance and trouble to consular officers, without benefiting any one, helping not even the complaining shipmasters. Another relief would be to allow everything which enters into the construction of vessels to pass free of duty, and to permit, under proper restrictions, the withdrawing from bond of whatever is used on our vessels.

An additional disadvantage under which American vessels labor when brought in competition with British vessels comes from our method of taking tonnage measurement. British vessels are measured with deductions which are not allowed to American vessels. I will give, as examples, two British steamers which loaded in Sagua this year: the British steamer Clandon, gross tons 1,971, net tons 1,286; and the British steamer Leina, gross tons 1,782, net tons, 1,141. These paid tonnage dues on their net measurement. Had they been American steamers (and up to July 1, 1882, no deductions were made for even coal-space), dues would have been collected on the gross tonnage. The difference in these charges at \$1 per ton is considerable, and the British steamers thus secure over ours an advantage of about 50 cents per hoghead on their cargoes.

Commerce.—There were exported from Havana, in 1880: 90,523 boxes, 219,323 bags, and 190,088 hogsheads of sugar; 12,438 hogsheads, of molasses; 1,476 tierces of honey; 9,873 pipes

of 125 gallons rum; 8,779 arrobas of 25 pounds Spanish wax; 12,464,936 pounds of tobacco, and 153,141 thousand cigars. Instead of being an exporter of coffee, Cuba now imports the same from Porto Rico. Copper-ore is, however, likely to soon again become an export article to England from the Cobre Mining Company's mines near Santiago de Cuba. The working of these mines was stopped by the insurrection, but is now being resumed.

The amount of cigars shipped from Havana to the United States during the year ended Sept. 20, 1882, was \$3,841,729 worth, of which New York received \$2,387,648; San Francisco, \$391,756; Chicago, \$174,121; Boston, \$144,604; and Philadelphia, \$57,688.

CHIEF ARTICLES OF MERCHANDISE IMPORTED INTO HAVANA.

About the trade between Cardenas and the United States, the American consular agent, Nufiez, remarks:

The export tonnage in English bottoms is increasing, for the reason that the English vessels are generally steamers carrying heavy freight, and at less rates than American vessels can afford to charter for. It may not here be inappropriate to suggest that if ever this island becomes an integral portion of the United States, the impetus which that fact would give to American ship-building would be very great. All the trade, in such an event, would be coast-trade, and in American bottoms. A growing article of export from Cardenas is asphaltum, and it is claimed that the Cardenas asphaltum is superior to that of any other part of the world. There is much asphaltum in the island of Cuba; much of it is of questionable quality and is called *chapapote*, but that which is ob-

tained at this port is dredged from the bed of the bay, and at upward of sixty feet below the surface of the water, and is supposed to be inexhaustible. It sells for export at \$30 per ton.

Sugar.—This industry has been thoroughly revolutionized by the introduction of central sugar-houses and new processes; clayed sugars have gradually gone into disuse, and centrifugals and muscovadoes have taken their place, as the ensuing table of exports fully demonstrates:

YEAR.	BOX SUGAR.		MUSCOVADOES, ETC.		To the United States.	
	Consisting of		Consisting of			
	Tons.	Bboxes.	Tons.	Hogs'hd.

Total.....	\$328,071,264	\$60,468,591

The chief articles of domestic production imported from the United States during the fiscal year ended June 30, 1882, were cattle and horses, \$580,592; breadstuffs (including only 56,955 barrels of flour), \$1,029,653; coal, 100,319 tons (\$409,970); cordage, \$205,110; machinery and hardware, \$1,572,076; provisions, \$2,840,480, which included 15,279,152 pounds of lard; lumber, timber, and furniture, \$2,907,331; and paper and stationery, \$223,814.

D

DAKOTA. Territorial Government.—The Territorial officers during the year were: Governor, N. G. Ordway; Secretary, George H. Hand, succeeded by J. H. Teller; Treasurer, William H. McVay; Auditor, L. M. Purdy, succeeded by George L. Ordway; Superintendent of Public Instruction, William H. H. Beadle; Attorney-General, Alexander Hughes.

Legislative Session.—The Legislature, containing 31 Republicans and 5 Democrats in both Houses, convened on the 8th of January, and adjourned on the 9th of March. The following are extracts from the Governor's message:

During the two years that have elapsed since the meeting of the last Legislature, our population has increased from 150,000 to nearly 300,000; our taxable property has increased from \$20,000,000 to \$50,000,000; and the agricultural and mechanical developments have fully kept pace with this remarkable increase of property and population.

The Territorial finances are in a most satisfactory condition.

It is asserted that mines producing a revenue sufficient to pay large dividends upon \$15,000,000 or \$20,000,000 of stock or shares, are escaping their equal share of taxation by the payment of taxes upon less than one fifth of the actual value of the property. It is also asserted that patents have been declined upon lands granted by Congress to certain railroads running through the Territory, although the lands have passed into other hands under contracts and are thus kept out of the assessors' lists.

As a member of the Board of Equalization and Assessment, it has come under my observation that gross inequality exists in assessing the land and personal property in the various counties. I am, therefore, constrained to believe that a large amount of property in the Territory wholly escapes assessment.

The present laws give county commissioners almost unlimited power to mismanage the finances and wreck a county. As a board of equalization, they sometimes assume the authority, under the pretense of revising the assessors' lists, to cut down the assessments in certain cases nearly one half, without attempting to find any property which has escaped assessment, or that has been assessed too low, to make up the deficiency—thus largely increasing the rate upon the property which remains unchanged. Under the operation of this unequal system the Territorial Board of Equalization and Assessment are compelled to adopt a higher average rate than would be necessary if a better system was provided.

There is now outstanding against various counties in the Territory nearly \$100,000 of Territorial taxes, heretofore assessed upon delinquent counties, yet the present laws provide no adequate means for the collection of this large sum.

The failure of the officers of Yankton county to meet the requirements of \$200,000 of bonds issued to aid in the construction of a railroad, has caused severe criticism and unfavorable comment during the discussion of the bills for the admission and division of the Territory. Certain enactments passed by the last Legislative Assembly, although general in their provisions, intended to prevent the assessment of taxes, have been widely and unfavorably commented upon in the public press. The people of Yankton county, previous to the last election, inaugurated a movement to refund or liquidate these outstanding bonds, bearing a high rate of interest, by the issuance, under congressional authority, of a well-guarded low rate of interest bond which the revenues of the county

could meet as the interest and principal should fall due.

There are now pending in both Houses of Congress bills providing a comprehensive enabling act for dividing the Territory by the admission of the southern half as a State; also a bill for dividing the Territory substantially upon the same line. It is not denied that the southern portion of the Territory has the required number of inhabitants, who, if living in a State, would be entitled to a member of the House of Representatives. It is not denied that the amount of taxable property in the southern portion is fully equal to that in any Territory that has been admitted as a State.

After giving an official history of the floods of 1881, the Governor recommends that provision be made to send assistance in any similar emergency. He strongly urges the establishment of an immigration, mining, and agricultural board of three members, one for each department, who shall collect statistics and give information about the Territorial resources. He calls attention to the probable opening of the Big Sioux Reservation, and that such legislation be taken as may be necessary.

The total number of bills sent to the Governor was 385. In the Council about 250 bills were introduced, and nearly 300 in the House. Of these 280 became laws, either by signature or limitation. Among the most important bills which became laws are the bill for capital removal; for creating a tax commission to inquire what property escapes taxation, and to suggest remedies and look after delinquent taxes, of which there are large amounts outstanding. The bill creating the office of attorney-general is another important measure. The educational bill is, perhaps, the most important measure of the session. This law adopts the civil township system and is a much-needed measure. A bill of great consequence to North Dakota is the one providing a board of grain-inspectors to look after the weighing and grading of grain.

The institutions for which provision was made, either for building or running expenses, or both, were the following: Penitentiaries at Sioux Falls and Bismarck; Hospitals for the Insane at Yankton and Jamestown; universities at Vermilion and Grand Forks; and normal schools at Spear Fish and Madison; Agricultural College at Brookings; School for the Deaf and Dumb at Sioux Falls. The Agricultural College was located at Fargo and the Reform School at Plankinton, but no appropriations were made.

The capital-removal bill, as passed, provides for the appointment of a commission of nine to determine upon a suitable location for a permanent capital. The commissioners are put under \$40,000 bonds to perform their duties faithfully, and are to receive \$6 a day for their services, but the total amount of expense may not exceed \$10,000. On or before

July 1st, a place is to be selected, and the town or town site chosen is to give the Territory 160 acres of land and \$100,000 in cash for public buildings. A bill reorganizing the legislative districts passed. Each district is entitled to one councilman and two representatives.

Finance.—The statement of receipts and disbursements for the fiscal years 1881 and 1882 is as follows:

RECEIPTS.	
Balance in Treasury, Dec. 1, 1880.....	\$1,905 73
From counties, 1881.....	55,918 84
From counties, 1882.....	102,005 98
From railroads, 1881, for 1880 tax.....	22,583 89
From railroads, 1882, for 1881 tax.....	35,614 39
From telegraph companies, 1882.....	518 55
From sale of Insane Hospital bonds, 1881.....	41,540 00
From sale of Penitentiary bonds.....	51,522 50
From insurance companies for loss on Insane Hospital.....	3,000 00
From sale of codes, 1881.....	70 50
From sale of codes, 1882.....	65 00
From sundries, 1881.....	125 65
Total.....	\$314,878 00

DISBURSEMENTS.	
For Auditor's warrants, 1881.....	\$77,484 57
For Auditor's warrants, 1882.....	151,116 83
For interest on warrants, 1881.....	1,898 37
For interest on warrants, 1882.....	698 00
For interest on Insane Hospital bonds, 1882.....	2,400 00
For interest on Penitentiary bonds, 1882.....	1,900 20
For counties, proportion railroad-tax, 1881.....	18,690 00
For counties, proportion railroad-tax, 1882.....	22,594 68
For exchange and express charges, 1881.....	25 05
For exchange and express charges, 1882.....	148 65
Balance in Treasury, Nov. 30, 1882.....	48,468 90
Total.....	\$314,878 00

LIABILITIES OF THE TERRITORY, NOV. 30, 1880.	
Five-twenty 6 per cent. Insane Hospital bonds, dated May 4, 1881.....	\$40,000 00
Five-twenty 6 per cent. Penitentiary bonds, dated May 1, 1881.....	50,000 00
Total.....	\$90,000 00

ASSETS OF THE TERRITORY, NOV. 30, 1882.	
Balance in general fund.....	\$41,149 29
Balance in Insane Hospital construction fund.....	68
Balance in Penitentiary construction fund.....	2,318 98
Total.....	\$43,468 90

The assessed value of property in 1882 was nearly \$48,000,000.

Bonds to the following amounts were authorized by the last session of the Legislature:

For permanent improvement Sioux Falls Penitentiary.....	\$30,000
Construction of Bismarck Penitentiary.....	50,000
Deaf-Mute School at Sioux Falls.....	12,000
Dakota University at Vermilion.....	80,000
North Dakota University at Grand Forks.....	80,000
Agricultural College at Brookings.....	25,000
Hospital for the Insane, Yankton, permanent improvements.....	77,500
Building the Hospital for the Insane at Jamestown..	50,000
Total.....	\$304,500

Gov. Ordway, in his report for 1883, says:

Four years ago the Territory owed some \$20,000 in warrants, which securities, bearing 10 per cent. interest, for want of funds, were selling at a large discount. These warrants have all been paid off from current revenues, leaving a handsome surplus in the Treasury, and the Territory will have an outstanding indebtedness, when all the bonds provided for by the last two legislatures are issued, of \$394,500, bearing but 5 and 6 per cent. annual interest; substantially the same amount outstanding against Yankton county,

but not as large an amount of indebtedness by one third as Lawrence county owes. These two counties have assets to show for their large indebtedness, ordinary court-houses and jails, valued perhaps at \$15,000 each. The Territory, on the contrary, will have two penitentiaries, two hospitals for the insane, two universities, two normal schools, one school for deaf-mutes, and one and perhaps two agricultural colleges, all costing in round numbers \$400,000, yet worth to the people double that sum, and so located in the east, west, north, and south that one great State or two smaller ones can securely and safely be placed upon these essential foundations. This total indebtedness of the Territory could easily be paid and every Territorial bond retired next year by the assessment of a five-mill tax upon the assessable property in the Territory, without the slightest shock to business enterprise. It has been thought, however, more just to defer the payments for the erection of these institutions until the public lands to be given to the State under the "Burrows enabling act" shall become available.

Education.—The total school revenue of 34 counties, for the year ending March 31, 1882, was \$343,719, which the superintendent is satisfied a full report would have increased to \$500,000. This sum is raised almost wholly by direct taxation, since it does not seem from the reports that the proceeds of bonds issued to enable districts to erect and furnish school-houses were included in receipts to any considerable extent. Reports from 33 counties show the following statistics:

Total school districts organized.....	1,225
Total graded schools.....	40
Total ungraded schools.....	965
Number of school-houses.....	799
Value of same.....	\$528,877
Amount paid county superintendents.....	83,616
Average wages paid teachers, male.....	33
Average wages paid teachers, female.....	26
Total expenses of the office of Superintendent of Public Instruction for salary, mileage, office, printing, books, stationery, and postage.....	950

An agricultural college at Brookings, one or two normal schools, Dakota University at Vermilion, and Yankton College at Yankton, have been established.

Capital Removal.—On the 2d of June the commission for choosing a site for the Territorial capital selected Bismarck, and on the 25th of August work was begun for the erection of the Capitol. On the 11th of September Gov. Ordway ordered the Territorial Auditor, Secretary, and Treasurer to remove their offices from Yankton to Bismarck. The Auditor complied, but the Secretary and Treasurer refused to remove. On the 15th of September the decision of Judge Edgerton of the Supreme Court declaring the appointment of the commissioners illegal, was made public. An appeal was taken to the full bench, but it had not been argued at the close of the year.

State Constitution.—On the 19th of June a convention, comprising more than 400 delegates from the southern portion of the Territory, belonging to both political parties, assembled at Huron to consider the question of calling a constitutional convention. This body adopted a preamble and resolutions, from which the following extracts are taken:

Whereas, The Territory of Dakota, lying south of

the forty-sixth parallel of latitude, has at present a population of more than 250,000 people, which, at its present rate of increase, will in another twelve months number over 300,000 people, which is more than double the population of any State heretofore admitted into the Union out of the Territories, and more than that of seven of the original States at the time of their admission; and

Whereas, The said part of the said Territory covers an area of 80,000 square miles, which is larger than that contained in any State in the Union except seven; and

Whereas, The last Legislature of this Territory, wisely acceding to and representing the general and earnest wish of the people thereof, did enact a law convening a constitutional convention at the Capitol of the Territory in October next, for the purpose of framing a Constitution and State government for that part of Dakota south of the forty-sixth parallel, and for forming all other things essential to the admission of such part of Dakota into the Union of States; and

Whereas, The said act of the Legislature was prevented from becoming a law by the Territorial Executive declining to approve the same or return it to the Legislature with his objections, thus depriving that body from taking further action relating thereto; therefore be it

Resolved and ordained by the people of Dakota, through their delegates in convention assembled:

SECTION 1. That for the purpose of enabling the people of that part of Dakota south of the forty-sixth parallel to organize and form a State government, and make application for admission into the Union of the States, a delegate convention is hereby called to meet on Tuesday, Sept. 4, A. D. 1883, at 12 o'clock meridian, for the purpose of framing a State Constitution, republican in form, and doing and performing all other things essential to the preparation of the Territory for making application to the General Government for the admission of such part of Dakota into the Union of the States.

An address to the people in favor of the convention was issued, and Sioux Falls was fixed upon for the place of meeting. The delegates were duly elected, and the convention met on the 4th of September, and finished its labors on the 19th. Important features of the Constitution framed by it are the following:

The name shall be the State of Dakota; the boundaries begin where the forty-sixth degree of north latitude intersects the western boundary-line of the State of Minnesota, thence south to Nebraska, thence west along the northern boundary of that State and to the twenty-seventh degree of west longitude, thence north to the forty-sixth parallel, and east to the place of beginning; the seat of government shall be and remain at Yankton until removed by law.

The right of trial by jury shall remain inviolate, and extend to all cases at law without regard to the amount in controversy; but a jury trial may be waived by parties in all civil cases, and in all criminal cases less than felony. No religious tests or amount of property shall ever be required as a qualification for any office of trust under the State, and no person shall be rendered incompetent to give evidence in any court of law or equity in consequence of his opinions on the subject of religion, nor shall any money be drawn from the Treasury for the benefit of religious societies or theological seminaries; no *ex post facto* law, nor law impairing the obligation of contracts, or retrospective in its operations, or making any irrevocable grant of special privileges, franchises, or immunities shall ever be passed by the Legislature; no law or duty shall be imposed without the consent of the people or their representatives in the Legislature, and all taxation shall be equal and uniform; no law shall be passed granting to any citizen or class of citizens privileges or

immunities which, upon the same terms, shall not equally belong to all citizens.

The number of members of the House of Representatives shall never be less than fifty-five nor more than eighty, and the number of Senators less than twenty-five nor more than thirty-two. The sessions of the Legislature shall be biennial. The terms of members of the Legislature shall be two years, and their salary three dollars a day, and ten cents mileage each way; they shall receive pay for no more than forty days at one session, except in proceedings for impeachment, and they shall receive no other perquisites. The Legislature shall meet at the seat of government on the first Tuesday after the first Monday of January. No bill except appropriation bills shall be passed containing more than one subject. The Legislature shall not authorize any games of chance, lottery, or of gift enterprise under any pretense, or for any purpose whatever. The Legislature shall never grant any extra compensation to any public officer, agent, servant, or contractor after the services shall have been rendered or the contract entered into; nor shall the compensation of any public officer be increased or diminished during his term of office. The Legislature shall not pass any local or special law authorizing the creation, repairing, or extension of liens, granting divorces, changing names of persons or places, laying out or opening highways, vacating grounds, providing for the election of municipal officers, exempting property from taxation, granting to any private corporation, association, or individual any special or exclusive privileges, immunities, or franchises whatever. No act shall take effect until ninety days after the adjournment of the session at which it passed, unless in case of emergency.

The Supreme Court shall consist of three judges, to be chosen from districts by qualified electors at large. After five years the number of supreme judges may be increased to five, and their terms shall be four years. In case of re-election, it shall be eight years, and the third successor's term shall be twelve years.

The right to divert and appropriate the unappropriated waters of any natural stream in the State to beneficial uses shall never be denied. Priority of appropriation shall give the better right to the extent to which such waters shall be used, or intended in good faith to be used, for such beneficial purposes. Vested and accrued water rights shall be recognized and protected; provided that nothing in this article contained shall change the rule of riparian ownership in that portion of the State east of the Missouri river. All persons and corporations shall have the exclusive right of way across public and private corporate lands, for the construction of ditches, canals, and flumes for the purpose of conveying water for domestic purposes, for the irrigation of agricultural lands, and for mining, milling, and manufacturing purposes, and for drainage, upon payment of just compensation.

All railroads, canals, and other transportation companies, are declared to be common carriers, and subject to legislative control. Every stockholder shall have the right to vote in person or by proxy the number of shares of stock owned by him for as many persons as there are directors or managers to be elected, or to cumulate said shares and give one candidate as many votes as the number of directors multiplied by the number of his shares of stock shall equal, or to distribute them on the same principle among the many candidates as he shall see fit. This Constitution shall be submitted, at the election to be held on the Tuesday next after the first Monday in November, A. D. 1883, to the electors qualified by this Constitution to vote at all elections.

On the 12th of September a convention of delegates from the northern portion of the Territory assembled at Fargo and passed resolutions protesting against the action of the convention held at Sioux Falls.

At the election in November the Constitution was ratified by a majority of 5,552.

Progress during the Year.—Relative to the condition and recent progress of the Territory, Gov. Ordway, in his report for 1883, says:

The tide of immigration which set in strongly in 1880 has been constantly increasing, until during the past year, I think, a fair estimate of the increase in population would reach 100,000, while the increase of assessable property has even been more marked than the increase in the number of inhabitants.

The section properly denominated the "Corn Belt," running as far north as the 44th degree of north latitude, and west to the 24th degree of longitude west from Washington, has been unusually prosperous during the past year. Flax and even wheat, which sometimes blights during the extreme heated term, have yielded handsomely. Sheep-husbandry and stock-raising have both received a marked impetus in what is known as Southern Dakota, and general farming is fast becoming the rule in that section.

The Black Hills mining region and the Great Sioux Reservation, embracing the section of country lying west of the 24th degree of longitude west from Washington, still remain somewhat isolated. The agricultural developments, however, in the counties of Pennington, Fall River, Custer, Lawrence, and Butte, have increased wonderfully. Flour, vegetables, and other agricultural products, formerly transported into the Black Hills at heavy expense, have, during the past year, been exported overland to Pierre and other points on the Missouri river, and sold at remunerative prices. The increase in stock and sheep husbandry in this section during the past year has been marvelous. The cattle-trade alone, west of the Missouri river, absorbs many millions of dollars every year.

The wheat belt, commencing at the 44th parallel of north latitude and extending to the extreme northern portion of the Territory, has maintained its well-earned fame for producing the largest number of bushels per acre of the best wheat grown on this continent. The continued large returns to investors in wheat-lands have largely increased the improved acreage and carried up the price from \$5 to \$25 per acre on the Northern Pacific Railway and in the Red River valley. Even in the center of the Bad Lands, on the Little Missouri river, a large amount of capital has recently been invested in cattle and sheep, which are said to find excellent feed and shelter in that romantic and weird region.

The annual production of gold and silver in the Black Hills region still continues, although, owing to the scarcity of water and the necessity for having expensive mining machinery, the increase has not been large during the past year.

Miscellaneous.—The yield of wheat in 1883 has been stated at 16,128,000 bushels, being an average of 16 bushels an acre. In November, 1882, John B. Raymond, Republican, was elected delegate to Congress by a vote of 38,151 against 9,034 for his Democratic opponent. The following Territorial institutions have been established: Hospital for the Insane, at Yankton; Penitentiary and School for Deaf-Mutes, at Sioux Falls.

DANUBE, EUROPEAN COMMISSION OF THE, an international corporate institution, exercising certain sovereign powers, independent of the Roumanian Government, over the Danube below Galatz. It was originally created by the Treaty of Paris, signed March 30, 1856, was confirmed and endowed with larger powers by the Treaty of Berlin, signed July 13, 1878, and at the expiration of its term of full powers on

March 13, 1883, was reconstituted and extended for twenty-one years, with power of perpetual renewal. The jurisdiction of the commission was extended over the middle Danube as far as Braila. Its sovereign rights are derived from the delegated authority of the seven contracting powers and of Roumania. They consist in the exercise of police control over the river, the right to enact and issue regulations which have the force of law, and powers to levy imposts and to contract loans, and to employ its resources in public works for the improvement and conservation of navigation. The seat of the commission is at Galatz. The first regular meeting of the new Commission was held on Nov. 3, 1888.

Finances.—The financial report of the Danubian Commission for 1881 shows an excess of receipts amounting to 842,095 francs. The total receipts amounted to 3,448,190 francs, of which 1,985,052 francs were derived from taxes, including 147,828 francs from pilotage and light-house dues, and 1,463,188 francs from other sources. The total expenditure was 2,606,095 francs, under the following main heads:

	Francs.
Administration	289,458
Technical service	711,098
Service of the debt	1,111,655
Various charges	488,854
Total	2,606,095

The debts of the commission amounted, on Jan. 1, 1882, to 2,781,911 francs, and consisted of an advance made by the Sublime Porte, which ceded the claim to Erlanger & Co., amounting to 2,469,371 francs, paying 4 per cent., which was paid off at the end of 1883, and a loan of 312,540 francs, extinguished in 1882. Besides a reserve fund of 1,000,000 francs and the surplus, in 1881, of 826,095 francs, the commission had a sinking fund of 264,856 francs, and a pilotage fund amounting to 44,565 francs.

Trade and Navigation.—The shipments of grain, which is the principal article of export, from all the ports of the lower Danube, in 1882, aggregated 6,629,843 quarters, against 5,401,441 quarters in 1881.

The total number of steam-vessels cleared at Sulina in 1882 was 760, of 741,066 tons, against 770 of an aggregate tonnage of 653,016, in 1881; the total number of sailing-vessels in 1882 was 784, tonnage 110,179, against 941 of 140,438 tons in 1881. The tonnage of 1882 was divided in respect to nationality as follows:

FLAG.	Steam-tonnage.	Sail-tonnage.
English	607,219	1,324
Greek	41,956	64,787
Austrian
French	69,784
Russian	4,859	8,373
Turkish	82,071
Italian	2,060	7,341
Roumanian	1,458
German	9,724
Danish	7,789
All others	8,896
Total	741,066	110,179

The points where sea-going vessels can load with grain from the lower valley of the Danube, are the river-ports of Galatz and Braila, and the adjacent ports of Kustendje and Varna on the Black sea. All the grain which finds an outlet by the mouth of the Danube is grown in Roumania and Bulgaria. The wheat of Hungary and the whole upper valley of the river is exported by other channels of commerce. In times of scarcity in Hungary, there is a small movement of grain up-stream beyond the Iron Gate, which rarely exceeds 850,000 tons per annum, but which may be augmented by the improvement of the channel in the difficult stretch where it passes through the Carpathians. There is a limited traffic in manufactured goods from Germany, Austria, and Hungary, which are shipped down the river in the vessels of the Austrian Danube Steam Navigation Company, a privileged corporation which monopolizes all the through traffic between Vienna and Galatz, and much of the local traffic on the upper course of the river. The freight-charges by this route are, however, so high that the construction of Roumanian railroads has taken away a great part of the traffic with the left bank, and the introduction of English and Swiss manufactures by the Sulina mouth has diminished the portion which went to Bulgaria.

The whole tendency of modern progress is to diminish the importance of the Danube as a commercial highway. It is not used as an outlet for Central-European commerce, which finds its way by rail to the German ports on the Baltic and the North seas, or to the Austro-Hungarian ports of Fiume and Trieste on the Adriatic. Even to the countries traversed by its lower and middle course it is only an alternative route, which is losing importance as railroads are extended. The Roumanian Government recently acquired the Kustendje-Tohernevoda railroad, and intends to develop Kustendje into its principal seaport. Grain can be shipped across to and loaded in vessels at Kustendje with great saving of time. A bridge over the Danube at Tohernevoda will connect this line with railways coming from the north and west which are being constructed. The completion of the Turkish, Servian, and Bulgarian network connecting with the Austro-Hungarian, for which Austria finally succeeded in 1883 in getting a project adopted (see *AUSTRIA-HUNGARY*), will alter the commercial conditions of all Southeastern Europe, and deflect a large part of the Danubian trade.

Projected Improvements of Navigation.—The entrance of the Danube was rendered passable to ocean-going vessels by the European Commission on the plans of Sir Charles Hartley. The Sulina branch was deepened and rectified, and a large volume of water which formerly found an outlet by the St. George's mouth was deflected into this channel. The flow of water at the upper bifurcation, at Ismail Chatal, was also regulated, and a portion of the waters of

the Kilia branch drawn into the navigable channel. At the London Conference of 1883 a second commission was created, which was charged with the task of improving the navigation of the Danube from Braila, or Ibraila, up to the Iron Gate. This long middle course of the Danube differs very much from the tranquil stream that traverses the plain below Galatz and issues through the three branches of the delta. It comprises over 450 miles of shifting river-bed, about 800,000 acres in extent. The river is a rapid and turbulent stream, which forms shoals and islands in a few days or hours and constantly changes its channel. It sweeps down immense quantities of ice, moving it with sufficient force to crush the sides of a ship. It is impassable for a large part of the year on this account, and navigation is sometimes dangerous for nine months out of the twelve. It therefore lies beyond the power of engineering skill to render the navigation of the middle Danube passable to the class of vessels which ply up to the river-ports below, or safe for any craft.

Above the Iron Gate, within the Austro-Hungarian dominions, the Danube is the same rapid and ice-swept stream, though less unstable in its channel than below. The two parts of the river are separated by the difficult and dangerous rapids of the Iron Gate. The removal of the rocky obstructions at that point is a formidable task, but the improvement in the facilities of the river-traffic will repay the outlay. This work has been undertaken by the Hungarian Government.

Danubian Questions.—The Treaty of Paris, concluded in 1856, constituted two commissions—the European Commission and the Riverain Commission. To the European Commission the control of the river was confided temporarily, and its powers were intended to last but two years. The Riverain Commission was created as a permanent institution, and was expected to take over the functions of the European Commission and to conduct the operations for the improvement of the river and regulate the navigation throughout its entire course. As a matter of fact, the Riverain Commission never exercised its powers, while the European Commission was continued provisionally, and after carrying out the improvements at the Sulina mouth, and deepening that channel to admit sea-going vessels, retained jurisdiction over the navigation of the lower reaches of the river below Galatz until it was formally recognized in the Treaty of Berlin, and its functions maintained and prolonged. That treaty provided that Roumania should be represented on the commission, and that the powers of the commission should be exercised as far as Galatz, in complete independence of the territorial authorities. The same instrument enacted that regulations in respect to navigation, river police, and supervision above Galatz as far as the Iron Gate should be framed by the European Commission, with the assist-

ance of delegates from the riverain states, in harmony with those issued or to be issued for the portion of the river below Galatz. The treaty contained an article providing that one year before the expiration of the term fixed for the duration of the powers of the commission, the powers should come to an understanding in respect to the prolongation of its authority or the modification of its constitution.

The prolongation of the European Commission and its retention of the powers which were intended for the Riverain Commission were mainly owing to the attitude of Roumania. That state was naturally jealous of the anomalous assumption of rights superseding its sovereignty over a river flowing through its territory. It was particularly suspicious of Austria, and strove to exclude its powerful neighbor as far as possible from participation in the proposed Riverain Commission, and to deny her a share in the navigable portion of the water-way, on the ground that within Austrian territory the Danube is not navigable. In point of fact, Austria has no important commercial interests and but slight military interest in the waters of the lower Danube. On the middle Danube, however, she can claim a preponderant interest through the privileged and formerly subsidized Austrian Danubian Steam Navigation Company, which monopolizes the steam-traffic on that portion of the river. She was actuated by her general Oriental interests and by her moral position in respect to her one great river, as much as by her material interests in it, to assert the full strength of her position. As Roumania refused to accord her a commensurate share of influence as a riverain power, she used her voice as a great power to perpetuate the European control, sacrificing her exclusive riverain rights rather than yield them up to the control of a distrustful and possibly unfriendly combination of riparian states. The maritime powers of Western Europe, who were the real beneficiaries of the improvements made by the European Commission, were naturally inclined to assert and extend the principle of international control and perpetuate the institution which gave complete security to freedom of navigation and the facilities of commerce.

In 1882, when the time for a new settlement of Danubian affairs was at hand, a serious attempt was made to construct a mixed Riverain Commission, composed of delegates from Austria-Hungary, Roumania, Servia, and Bulgaria, to which should be committed the administrative management of the navigation above Galatz, in harmony with the regulations of the European Commission for the lower reaches. At that time Austrian and Russian antagonism was more salient than later. The Servian Government was supposed to be subservient to the wishes of Austria, while Bulgaria was under Russian control, and Roumania was regarded as susceptible to Russian influence through her dread of Austrian domination.

Austria laid claim to the permanent presidency and casting vote in the proposed Mixed Commission. Roumania strenuously opposed this proposition. The Roumanian Prime Minister was even betrayed into the official expression of a hostile menace against the Hapsburg monarchy. Great Britain objected to the Riverain Commission, unless a general right of appeal from its decisions to the European Commission was accorded. Barrère, the French delegate on the commission, proposed a compromise which was intended to obviate the English objection to confiding the management of the navigation of the middle reaches, declared free up to the Iron Gate by the Treaty of Berlin, to the exclusive administrative direction of the riverain states, and also the Roumanian objection of giving Austria the deciding voice. The Barrère *avant-projet* was to create a fifth member in the Mixed Commission, who should represent the European Commission. The delegates of the signatory powers in the European Commission were to succeed one another from year to year in the alphabetical order of the names of the countries. Roumania raised an objection to this proposal, viz., that Germany (Allemagne) and Austria-Hungary (Autriche-Hongrie) would by this arrangement control the decisions of the new commission for the first two years, thus enabling Austria's wishes to prevail in drawing up the administrative regulations.

While Roumania on her part was seeking to shape the course of the diplomatic deliberations so as to restrict as far as possible the international control over her territorial waters and prevent Austria from acquiring a directing influence in the management of the portion yet to be improved and made free to all nations, while the maritime powers were interested in extending the sphere of international supervision and control, and while Austria exerted herself to curb Roumanian pretensions and secure a preponderant riverain position, Russia embraced the opportunity to bring forward a claim which would perhaps not otherwise have been entertained. This was to withdraw the Oczakov mouth of the Kilia branch from the jurisdiction of the European Commission. When Bessarabia was receded to Russia, her territorial rights were defined as extending to the Thalweg of the Kilia branch. This has been decided to lie along the Kilia, or southern arm of the Kilia branch. Both banks of the Oczakov arm therefore belong to Russia, while the southern arm forms the boundary-line between Russia and Roumania. The objections to abandoning the European control of this outlet to Russia were twofold: One was, that Russia, by establishing a fortified naval harbor there, could menace the navigable outlet of the Danube; the other depended on a technical question in engineering. This was whether, if, as Russia purposed doing, the Oczakov channel were deepened

and rendered navigable, it might not be possible to deflect the waters of the Danube into this channel and diminish the outflow of the Sulina mouth, so as to destroy the works of the Danubian Commission and give Russia entire control of the navigation of the Danube. If, on the other hand, the flow of the water is determined by the conformation of the beds at Ismail Chatal, where the river bifurcates, and can be regulated only there, then the opening of a second navigable outlet would be an advantage to international commerce. When M. Giers visited Vienna he secured the acquiescence of Austria in this demand, and accepted the views of the latter in regard to the claims of Roumania.

London Conference.—It was necessary that the divergent views of the powers should be harmonized in some fashion before March, 1883, in which month the mandate of the European Commission would lapse by expiration of its term. For the settlement of the terms of the new treaty, Great Britain invited the signatory powers to a conference at London, to begin February 5th. The diplomatic representatives of the powers at the court of St. James represented them in the conference. As the cabinets had not yet come to an agreement as to the basis on which some of the matters in controversy were to be arranged, the conference did not meet until three days after the date set, and did not close until March 10th, three days before the duration of the European Commission ended. Count Karolyi represented Austria; Count von Münster, Germany; M. Tissot and M. Barrère, of the European Commission, France; Earl Granville and Lord Edmund Fitzmaurice, Great Britain; Count Nigra, Italy; Baron Mohrenheim, Russia; and Musurus Pasha, Turkey. M. Ghika was present to claim a seat as the representative of Roumania. A seat on the European Commission was accorded to Roumania by the Berlin Treaty, because Galatz was by the treaty included in Roumanian territory, and the interests of that state in the navigation were largely increased. Great Britain was willing to accord Roumania an equal voice in the conference, but the motion was negatived, on the ground that the Berlin Treaty stipulated that the signatory powers were to decide as to the prolongation of the commission and the other questions which came before the conference. It was voted that Roumania and Servia should have a seat and a consultative voice, but no vote, in the deliberations. The Servian representative availed himself of this permission, but the Roumanian delegate declined to take part in the conference on those terms. Bulgaria, under the Treaty of Berlin, was to be represented by the Turkish plenipotentiary. The Bulgarian representatives who were present were allowed to listen to the proceedings, and a stipulation was made that the Turkish ambassador should lay before the conference any communication they might wish to convey.

London Convention.—The new Danubian Convention, which was signed at London, March 10, 1883, by the plenipotentiaries of the powers, embraced the following provisions:

I. The jurisdiction of the European Commission is extended from Galatz to Braila.

II. The powers of the European Commission are prolonged for a period of twenty-one years, dating from April 24, 1883.

At the expiration of this period the powers of the said commission will be renewed by tacit reinvestment every three years, except in the case when one of the high contracting parties gives notice, one year prior to the expiration of one of these triennial periods, of the intention of proposing modifications in its constitution or in its powers.

III. The European Commission shall exercise no effective control over those parts of the Kilia branch of which both banks belong to one of the riparian states on that branch.

IV. As to the portion of the Kilia branch which flows between Russian and Roumanian territory, and for the purpose of insuring uniformity of authority in the lower Danube, the regulations in force in the Sulina branch shall apply, under the supervision of the delegates of Russia and Roumania, to the European Commission.

V. In case Russia or Roumania undertake works, whether in the mixed arm, or between the two banks which belong to them respectively, the competent authority shall give information to the European Commission of the plans of these works, for the sole purpose of determining that they will have no effect on the condition of navigability of the other arms.

The works which have already been executed at the Chatal of Ismail will remain in the charge and under the control of the European Commission of the Danube.

In case of divergence of opinion between Russia or Roumania and the European Commission with regard to the plans of works to be undertaken in the Kilia branch, or of divergence of opinion among the members of the commission with regard to the proper limits of the extension of the works at the Chatal of Ismail, the matter will be submitted directly to the powers.

VI. It is understood that no restriction shall be made which will deprive Russia of the right to levy tolls destined to cover the expenses of works undertaken by her.

At the same time, with the view of safeguarding the reciprocal interests of navigation in the Sulina branch and the Kilia branch, the Russian Government, for the purpose of insuring an understanding on this subject, is to acquaint the governments represented in the European Commission of the toll regulations it judges proper to introduce.

VII. The regulations for navigation, river police, and supervision, elaborated June 3, 1882, by the European Commission of the Danube, with the assistance of delegates of Servia and Bulgaria, are adopted and incorporated in the present treaty and declared applicable to the part of the Danube between the Iron Gate and Braila.

VIII. All treaties, conventions, acts, and arrangements relative to the Danube and its mouths are maintained in all of their provisions which are not abrogated or modified in the foregoing stipulations.

IX. The present treaty will be ratified and the ratifications will be exchanged at London, within the space of six months, or sooner, if practicable.

The following explanatory resolutions were embodied in a protocol at the final sitting, with the understanding that they have equal effect with the provisions of the treaty:

1. It is agreed that the agents of the European Commission can, for purposes of information, circulate in the Kilia branch and its mouths.

2. It is unanimously agreed that the nomination of a Bulgarian delegate to the Mixed Commission will be submitted to the approval of the Sublime Porte, and that the consigning of this right in the protocol has the same efficacy as if it formed part of the treaty.

3. The dispositions of the regulations in their application to the portion of the river between the Iron Gate and Braila can not be interpreted as restricting the rights of jurisdiction possessed by consuls over the vessels of their countries resulting from treaties between the riverain states and the powers as against the local authorities.

The plenipotentiaries also unanimously agreed that they accepted the fifth article of the treaty as meaning that the tolls should not go into operation until they were approved by the powers.

The Mixed Commission.—The Barrère *avant-projet* was the basis of negotiations concerning the constitution of the Mixed Commission. In the final action of the conference important modifications in the scheme were made, to conciliate the riverain states which objected to the proposal. The order of rotation in which the European representative is to be sent by the European Commission to sit on the Mixed Commission was changed; and Austria, being permanently represented on the latter, renounced her claim to be represented in her turn as a signatory power. Roumania likewise was excluded from double representation. Alterations were made also in the regulations in their application to the middle course, to meet objections raised by Roumania and Bulgaria, viz., the method of nominating sub-inspectors of the river was changed, and also the manner in which the river was to be divided for purposes of management.

Roumanian Demands.—Roumania was far from satisfied with the result of the London negotiations. The presence within her territory of foreign executive officers administering powers superseding the authority of the national Government, was a source of ceaseless dissatisfaction, particularly so because the arrangements were entirely anomalous, as all regulations established for other international and neutralized rivers are administered by the territorial authorities. She, moreover, persisted in her objections to the fictitious position of Austria in the Riverain Commission, and renewed her claim to representation in a conference to decide these special questions. Representations were made to the cabinets, in which the following demands were formulated:

1. The riverain states shall, in addition to the rights in the channel of the river conceded to them in the London resolutions and their right to nominate river and harbor inspectors, also retain the executive administration of the police and navigation regulations; yet, in order to obviate every irregularity, the International Commission shall exercise supervision over the enforcement of the regulations and the appellate and supreme legal jurisdiction over the river.

2. Since the commission is not composed simply of representatives of the riverain states, the qualifications which entitle the participants to representation shall be defined, to wit, Bulgaria, Roumania, and Servia as riverain states, Europe through a delegate of the Danube Commission, Austria and Roumania

being debarred, and Austria individually and on the ground of her preponderant share in the commerce of the middle course of the Danube; the expenses of the commission to be at the charge of the riverain states alone.

3. Full participation of Roumania in the deliberations and decisions of the conference to discuss these special questions.

The Roumanian opposition to the London Treaty abated when it was found to be useless. By the time the treaty was ratified, in August, anti-Austrian sentiments were less potent in Roumanian politics, and the jealousy of the Roumanians was turned rather toward Russia; the Roumanian King visited Vienna, and overtures toward joining the triple alliance were in progress.

DELAWARE. State Government.—The following were the State officers during the year: Governor, Charles C. Stockley, Democrat; Secretary of State, William F. Ousey; Treasurer, John M. Houston; Auditor, Jesse L. Long; Attorney-General, George Gray; Superintendent of Public-Schools, Thomas N. Williams. Judiciary, Supreme Court: Chief-Justice, Joseph P. Comegys; Associate Justices, L. E. Wales, John W. Houston, and Edward Wootton. Chancellor, Willard Saulsbury.

Legislative Session.—The Legislature convened on the 2d of January, and adjourned on the 20th of April. On the 16th of January Governor Stockley was inaugurated. Eli Saulsbury, Democrat, was re-elected United States Senator. On the 23d the Legislature submitted to the Chancellor and judges the following questions:

1. Is it within the constitutional power of the General Assembly, by a concurrent vote of two thirds of the members of each branch thereof, to provide for the increase of the members of the Senate and House of Representatives in the General Assembly, and to apportion the members thereof unequally among the several counties of the State?

2. Is it competent for the General Assembly to provide by law for the election of members of either branch or both branches of the General Assembly from any or every county, from districts created by law within such county, in lieu of the election thereof upon general ticket throughout the county?

The Chancellor was of the opinion that while the Legislature could by a two-third vote increase the number of Senators and Representatives, the counties must be equally represented. If it was desired to give one a greater number than the others, a constitutional amendment would be necessary. The Chief-Justice decided the first question in the affirmative, and the second in the negative. Judge Houston agreed with the Chancellor, while Judges Wales and Wootton concurred in the main with the Chief-Justice. The subject was disposed of by the passage of an act proposing amendments to the Constitution for the purpose of increasing the number of Senators and Representatives in the General Assembly. It proposes that "the House of Representatives shall consist of 25 members, 11 of whom shall be chosen from New Castle county, 7 from Kent county, and 7 from Sussex county; provided, that of

the 11 Representatives from New Castle county, 4 shall be chosen by the citizens residing in the city of Wilmington and 7 by the citizens residing in the residue of said county"; and that "there shall be 4 Senators chosen from each county, provided that of the 4 Senators chosen from New Castle county, 2 shall be chosen by the citizens residing in the city of Wilmington and 2 by the citizens residing in the residue of said county."

The first election for representatives under the amended Constitution is to be held in November, 1886.

Other proposed constitutional amendments were, one empowering the General Assembly to pass an act providing for the incorporation of cities and towns, and one relating to the judiciary. Among other acts are the following:

- An act to prevent the procurement of abortion.
- An act in relation to corporal punishments. Allowing the court to remit whipping in the case of youthful criminals and those recommended to mercy.
- An act in relation to the requisition of fugitives from justice. Similar to corresponding statutes of other States.
- An act in relation to insane prisoners. Providing for the appointment of a commission in lunacy and the subsequent incarceration of the prisoner, if adjudged insane, in jail or almshouse, according to the gravity of his crime. Should he recover his sanity, he is liable to trial or sentence, as the case may be.
- An act to authorize the New Castle levy court to make a loan for the benefit of the trustees of the poor.
- An act concerning private corporations. A general incorporation act covering charters of all kinds except for towns, canal and railroad companies.
- An act to authorize the New Castle levy court to fund the floating debt of said county.
- An act to establish a State Library.
- An act for the encouragement of immigration, and to foster the agricultural interests of the State.
- An act to provide for the education and training of juvenile delinquents.
- An act regulating the practice of medicine and surgery. For the suppression of quacks.
- An act to regulate the practice of pharmacy.
- An act to secure manufacturers of railroad equipments and rolling-stock in making conditional sales and certain contracts for the lease thereof.
- An act in reference to the competency of jurors in capital cases.
- An act appropriating money for free schools and for other purposes.
- An act for the maintenance of colored schools.
- An act in relation to contested elections other than for members of the General Assembly and Governor.
- An act amending the act to provide a uniform ballot for election purposes. Gives a latitude of one fourth inch in the size of ballots, and provides that imperfections of paper shall not vitiate a ballot.
- An act in relation to the election of assessors and inspectors.

Twenty-four divorces were granted.

A local-option law, proposed by the State Temperance Alliance, was defeated.

Inaugural Views.—Governor Stockley, in his inaugural address, expressed the following views:

Should you approve of my suggestions in reference to the increase of the membership of the General Assembly, then I would recommend a further amendment, limiting the sessions thereof to the period of sixty days, which, in my judgment, would afford ample time for the transaction of all necessary business.

A supplement to the act entitled "An act in relation to Free Schools" was passed at the last session of the Legislature, creating the office of Assistant Superintendent of the Free Schools of the State. Having given considerable attention to the subject, I am satisfied that the object of the law will be more fully and effectually attained by a further subdivision of the labor of the office, and would therefore recommend, in lieu of a State Superintendent and assistant, that there be three superintendents, one for each county.

In the matter of education, I most cheerfully concur in the suggestions of my predecessor as to the manner of increasing the school fund, whereby the free-school system would be rendered more efficient, and earnestly recommend that such ample appropriations be made as will promote and establish a more liberal and higher standard of education among our citizens generally.

I trust that this Legislature will consider well the present and future condition of a large class of persons who, by the Constitution of the United States, are clothed with the full rights of citizenship. Whatever may be thought of the propriety of these amendments, they have long since become parts of our common Constitution; therefore, those who have been thus made citizens are entitled to the protection and benefits which the law of the land confers upon other citizens. What the State regards as good and essential for one class of citizens it should for all. We believe the almost general opinion, throughout the State, is in favor of the establishment of separate schools, as the only just and proper system for the education and best interests of both races, and the opposition most emphatic and pronounced against what are termed mixed schools, under any and all circumstances.

In my judgment, a well-regulated, judicious, and stringent license system, promptly and faithfully executed in every particular, would more effectually restrain the great evils of intemperance than other legislation.

The great interest which I feel in the development and building up of the agricultural, manufacturing, and mechanical interests of the State impels me to urgently recommend the passage of a law creating a Board of Immigration, clothed with all necessary power to encourage and afford proper and ample facilities for immigration into our State.

Finance.—In January the Auditor made the following estimate of State receipts for the year:

General fund, balance	\$80,148 70
Licenses	6,590 40
Philadelphia, Wilmington, and Baltimore Railroad	40,000 00
Junction and Breakwater Railroad	16,000 00
Breakwater and Frankford Railroad	8,000 00
Bank dividends	5,000 00
Tax on bank-stock	2,000 00
Collateral-inheritance tax	1,800 00
Secretary of State	900 00
Fire-insurance companies	800 00
Railroad capitation-tax	800 00
Brandy-tax	700 00
Total estimated receipts	\$170,648 74

ESTIMATED EXPENDITURES.	
Interest on bonds	\$25,000 00
Interest on Delaware College scrip	4,980 00
Interest on school fund	9,405 00
Judiciary and law and equity reports	18,000 00
Salaries of State officers	9,250 00
Librarian and Library	500 00
Janitor	100 00
Appropriations for colored schools	2,400 00
Militia	1,800 00
Salary of Adjutant-General	800 00
State Board of Health	850 00
General Assembly (expenses)	14,000 00
Legislative allowances	8,000 00
Printing, stationery, etc	8,000 00
State-House repairs	800 00
Miscellaneous	1,500 00
Total	\$98,685 00

Amount due the State:

From back tax and interest from the Junction and Breakwater Railroad.....	\$28,886 86
From Breakwater and Frankford Railroad.....	4,000 00
From Philadelphia, Wilmington, and Baltimore Railroad.....	6,750 00

Schools.—The statistics show a slight decrease in the number of pupils attending school in the school year of 1882 as compared with that of 1881, and likewise a decrease in the amount of money raised by local taxation for school purposes, though the aggregate sum appropriated to schools in 1882 was larger than in 1881 by reason of a considerable increase in the receipts of the general school fund. The average monthly pay of teachers throughout the State rose from \$27.84 in 1880 to \$30.95 in 1882. The smallness of salaries and the shortness of the school year, less than six months in Sussex county, largely explains the inefficiency of many schools. The total cost of educating 33,000 white children in the school year of 1881-'82 was \$181,799.84. The number of colored children in the State is a little less than one sixth the number of white children. The average enrollment is 10,000 less than the number of children of the school year, and the average daily attendance less than half the latter number. The average cost per head of educating the 23,450 white children enrolled was \$6.85.

DENMARK, a kingdom in Northern Europe. The Constitution is embodied in the charter of June 5, 1849, which was modified in 1855 and 1863, but restored in an altered form in 1866. The executive power is exercised by the King through a responsible ministry, and the legislative power by the Rigsdag or Diet. The Upper House is called the Landsting, and consists of 66 members, of whom 12 are nominated for life by the Crown, from actual or former representatives in the legislature, and the remainder are elected indirectly by the people for the term of eight years. The popular Chamber, called the Folkething, consists of 102 members, elected by direct universal male suffrage for three years. The only classes debarred from the franchise are those who have been recipients of public charity and persons in service who have no households of their own. The former class can regain the right by repaying the sums received. The limitation of age is thirty years. The Folkething decides in the first instance on all money bills presented by the Government. The Rigsdag meets annually on the first Monday in October. The Landsting appoints every four years four of its members to form with the judges of the Supreme Court the Rigsret, which is the highest tribunal and has cognizance of legislative impeachments.

The Government.—The reigning King is Christian IX, born April 8, 1818, fourth son of Duke William of Schleswig-Holstein-Sonderburg-Glücksburg. He was appointed to the succession by the Treaty of London, concluded May 8, 1852, and the Danish law of succession

of 1853, and succeeded to the throne on the death of Frederick VII. Nov. 15, 1863. The heir-apparent is Prince Frederick, born June 8, 1843.

The ministry, first organized June 11, 1875, is composed of the following members: J. B. S. Estrup, Minister of Finance and President of the Council; E. V. R. de Skeel, Minister of the Interior; J. V. M. Nellesmann, Minister of Justice and Minister for Iceland; Baron O. D. Rosenørn-Lehn, Minister of Foreign Affairs, appointed Oct. 11, 1875; Commander N. F. Ravn, Minister of the Navy, appointed Jan. 4, 1879, and since April 1, 1881, Minister of War; J. F. Scavenius, Minister of Worship and Public Instruction, appointed Aug. 24, 1880.

Area and Population.—The area of the kingdom of Denmark is 13,784 square miles; the population, 1,969,089, of which number 234,850 live in the city of Copenhagen, 865,678 in the islands of the Baltic, and 868,511 in the Peninsula of Jutland. The total population was divided as to sex into 967,860 males and 1,001,679 females. The increase in fifteen years was 10.29 per cent. in the cities, and 5.99 per cent. in the rural districts. The proportion who live by agriculture is 89.5 per cent. The land is greatly subdivided under the operation of laws which forbid the consolidation of farms into landed estates. The number of marriages in 1879, the last year reported, was 14,287; births, 62,455; deaths, 38,531; excess of births over deaths, 23,924. The emigration is mainly to the United States, and has become considerable in recent years. In 1868 there were 765 emigrants; in 1869, 4,359; in 1870, 3,525; in 1871, 3,906; in 1872, 6,893; in 1873, 7,200; in 1874, 3,322; in 1875, 2,088; in 1876, 1,581; in 1877, 1,877; in 1878, 2,972; in 1879, 3,108; in 1880, 5,667; in 1881, 7,985; in 1882, 11,614.

The dependencies of Denmark are the Faroe Isles, of which the habitable ones, 17 in number, have an area of 512 square miles, and a population returned in 1880 as 11,221; Iceland, with an area of 40,800 square miles, of which 16,100 are habitable, and a population of 72,438; Greenland, with a habitable area of 33,800 square miles and 9,700 inhabitants; and the Danish Antilles, of which Santa Cruz has an area of 82 square miles, St. Thomas of 33 square miles, and St. John of 20 square miles, the population of the three numbering 33,763. Returns dated Jan. 1, 1882, give the population of Northern Greenland as 4,217, and of Southern Greenland as 5,484.

Commerce and Navigation.—The total imports in 1881 amounted to 245,233,000 crowns, the exports to 133,472,000 crowns. (The crown or krone, the unit of account in the decimal currency, introduced in 1875, is half the value of the old rigsdaler and equivalent to 26.8 cents.) Of the total value of the imports, 58,970,000 crowns were from Great Britain, 91,141,000 crowns from Germany, and 24,848,000 crowns from Sweden. Of the total exports, 63,760,000

crowns went to Great Britain, 61,884,000 crowns went to Germany, and 27,968,000 crowns went to Sweden. The United States was the next largest importing country, furnishing 18,943,000 crowns of the imports, but took only 1,619,000 crowns of Danish products in return. The imports and exports of the general classes of merchandise in 1881 were valued as follows, in millions and tenths of millions of crowns :

MERCHANDISE.	Imports.	Exports.
Articles of food.....	88·7	188·0
Raw materials.....	77·1	22·5
Manufactured products.....	62·7	10·2
Machinery, tools, and other means of production.....	16·7	11·8
Total.....	245·2	188·5

In 1880 the total imports amounted to 227,400,000 crowns and the total exports to 196,600,000 crowns.

The total tonnage of vessels entered at Danish ports in 1881 was 1,894,996 tons in the maritime, and 848,554 tons in the coasting trade. Of the former, 566,545 tons represented steam, and 828,451 tons sailing-vessels. The total tonnage cleared was 1,444,263 tons in the maritime, and 822,352 tons in the coasting trade.

The mercantile fleet numbered in 1881 8,016 sailing-vessels, of 203,555 tons, and 202 steamers, of 51,984 tons, as compared with 8,091 sailing-vessels, of 213,201 tons, and 188 steamers, of 45,124 tons, in 1878.

The railroad mileage in 1882 was 810 miles belonging to the state, and 1,105 miles belonging to companies. The length of telegraph lines in operation in 1881 was 2,200 miles; length of wires, 5,840 miles.

Army and Navy.—Obligatory personal military service for all Danes was enacted by the law of 1867 and the supplementary law of 1880. Service begins at the age of 22 and lasts 16 years, 8 in the regular army, and 8 in the reserve. In the majority of cases infantry-men remain with the colors only from 6 to 11 months, and cavalry-men 20 months, after which they obtain leave of absence and are required only during the manœuvres. The total strength of the army on the war-footing in 1882 was 50,522, inclusive of officers.

The navy in 1882 comprised 2 iron-clad frigates, with 44 guns; 8 floating batteries, with 14; 8 casemated vessels, with 20; 8 torpedo-vessels, with 7; and 2 frigates, 3 corvettes, and 5 schooners, unarmored; 13 iron gunboats, 2 wheel-steamers, and 9 torpedo-boats; together 44 steam-vessels, of 81,214 aggregate horse-power, armed with 252 cannon.

Finance.—The closed accounts of the year 1880-'81 state the expenditures as 47,548,367 crowns, and the receipts as 51,745,463 crowns. The budget for the year 1883-'84 gives the estimated revenue as 51,982,822 crowns, of which 5,272,532 crowns come from railroads, interest on reserve funds, and other state prop-

erty, 1,186,676 crowns from the domains and forests, 9,004,700 crowns from direct taxes on lands, houses, and titles, 82,811,000 crowns from indirect taxes, and the rest from the state lottery and other sources. The expenditures are set down at 48,385,885 crowns, of which the public debt charges consume 9,821,700 crowns; civil pensions, 2,627,980; military pensions, 780,011; the civil list and appanages, 1,225,760; the Department of Worship and Instruction, 1,367,192; of Justice, 2,551,704; of the Interior, 2,067,075; of War, 9,118,851; of Marine, 5,888,939; of Finance, 8,046,768; Public Works, 5,426,072; extraordinary expenditures, 3,022,455.

The budget for 1884-'85, laid before the Folkething Oct. 2d, estimates the revenue at 53,578,743 crowns and the expenditures at 51,681,698 crowns. The increase in the revenues is derived from the indirect taxes, which are becoming more productive every year. The increased expenditures are due to the projected new railroads and the extensive system of fortifications for which the plans have been adopted.

The public debt on March 31, 1882, amounted to 201,664,701 crowns, of which 187,907,084 crowns represented the domestic debt and 13,757,667 crowns foreign loans. The assets of the state were valued at 84,306,206 crowns, of which 40,728,814 crowns were capital expenditure, 19,276,262 crowns reserve funds, and 24,801,130 miscellaneous assets. The cost of construction of the state railroads was at that date 180,052,928 crowns. The public debt will be reduced by April 1, 1884, to 197,000,000 crowns, making a total reduction of 88,000,000 crowns in fourteen years. The object of the large reserve fund kept on hand is to have funds at the disposal of the Government in any sudden emergency.

Constitutional Crisis.—The protracted conflict between the King, supported by the Conservative party, and the Liberal party, which forms the majority in the Folkething, and derives its support from the rural population and the democratic and socialistic masses in the capital, came no nearer to a solution in 1883. The legislative deadlock became more serious. The contest is over the prerogative of the King to appoint his ministry, whom the Opposition would require him to choose from the party of the majority, in accordance with the doctrines of parliamentarism. The chief subject at present in dispute between the King and the Parliament is the proposed fortification of the city of Copenhagen. The country party assert that this project, the cost of which has grown in the estimates from twenty to a hundred millions, will transcend the financial resources of the country, while affording no security for the military defense of the parts of the country more in danger and for the integrity of the kingdom. The items in the budget for the defensive works were thrown out, as usual. In April the Radicals endeavored to bring the con-

stitutional question to an issue by an address to the King expressing lack of confidence in the ministry. The Landsting adopted counter-resolutions; and deputations of both Houses waited on the King. The address of the Folkething reminded the King that the ministry, since its constitution, had been unable to obtain the assent of the legislature to any measure of importance except the annual budget; that in 1877 the expenditures for a part of the year were met by the assumption by the Government of unconstitutional powers, and those of 1881-'82 by occasional grants without a regular finance law; that the Government had dissolved the Folkething four times, and in each election an increased majority had confirmed the position taken by the Opposition; and that the country suffered great detriment from the stagnation of public business resulting from this never-ending conflict. The vote of censure was carried in the Folkething by a majority of 72 to 20, while the vote of confidence in the Landsting was supported by 40 against 10. The King received the addresses of both Houses, and in his answer rebuked the Folkething for defeating the legislative efforts of the Government and rejecting the plans for national defense, while he informed the Landsting that he would maintain the constitutional order against the attacks of the Opposition. To a deputation representing a mass-meeting of 18,000 persons which sought audience with the King in May, he replied that only the legislative representation, by which he understood both Chambers, could speak to him in the name of the people, and reaffirmed his right to choose his own ministers. All through the year popular meetings were held to protest against the attitude of the ministry. The Government, which upheld the same doctrine of the royal prerogative that is advanced by the German Government, though against no such pronounced and general popular dissent as is manifested in Denmark, attempted to strengthen their position, which was growing more and more untenable, by imitating the tactics of Prince Bismarck. In the session of the Rigsdag which opened Oct. 1st, the ministry brought in a bill to provide a system of old-age insurance for the poorer classes after the Folkething had tabled thirty ministerial measures. A scheme of superannuation annuities was inaugurated twenty years before by Minister David, but was afterward abandoned. A Government refuge for the aged already exists. The present proposition provides for the accumulation of a fund by weekly voluntary payments, to be repaid in the form of annuities, generally not exceeding 200 crowns, after the age of fifty-five, or returned in other cases with interest compounded at 2 per cent., the state furnishing the guarantee and defraying the expenses of administration. The Folkething did not reject this bill off-hand as it did the others, but debated it, referred it to a committee, and finally voted against it on its merits.

Socialist Congress.—The German Social-Democrats, while enjoying in the Reichstag the freedom of speech which the German Constitution insures, and commanding a degree of attention which is more than commensurate with their numerical strength in the legislature, are hunted by the police out-of-doors, and refused every right of assembly, speech, and printing, which would enable them to communicate with their constituents and consult upon party action. They not only dare not assemble in Germany, but through the influence of the German Government an asylum is likely to be refused to them in the neighboring countries. In 1888 they planned in secret to hold their annual convention in Copenhagen, while the German police and the public were led to suppose that it would take place at Zürich. They arrived unobserved and registered under assumed names in the hotels. There were fifty-six delegates, representing sixty districts of Germany, among them the entire Social-Democratic delegation in the German Parliament with two or three exceptions. There were representatives also of the German Socialists in England, France, and Switzerland. The Danish police discovered the character of the gathering on the second day, and warned them to take a speedy departure. They closed their three-days' session April 2d, and returned to Germany. The deputies Von Vollmar and Frohme were apprehended on landing at Kiel by the German police, and their detention was the subject of a discussion in the German Parliament. The Copenhagen Congress discussed, among other party matters, the position to be taken in the elections of 1884, and decided to oppose out and out the socialistic legislative projects of Prince Bismarck.

German Conscription of Schleswig Danes.—Among the difficulties which followed the high-handed disposal of the Schleswig-Holstein question by Prussia, is the anomalous position of that portion of the inhabitants of the annexed provinces who elected under the treaty to remain Danish subjects. A considerable proportion of the more substantial Danish farmers in Northern Schleswig availed themselves of the option, crossing the frontier and residing in Denmark long enough to preserve their rights of nationality according to treaty, and then returning to their homesteads. Their children are Danish subjects by birthright. This class now numbers from 20,000 to 30,000 in North Schleswig, and is increasing. In some districts one quarter or one third of the population are Danish subjects by option, or descendants of such. Disturbed at the increase of the Danish community, the Prussian Government issued a decree in January requiring the sons of Danish subjects to embrace the German nationality, and, as an indication of their intention of becoming naturalized, to report themselves for military service or to emigrate on pain of forcible banishment. This order created much excitement in Schleswig and

Denmark. The young Danes of North Schleswig paid no attention to it. The feeling in the province was manifested by the action of their deputy to the Reichstag, who, in consequence of the order, refused to take the oath of allegiance to the Emperor.

DIAMONDS AND THE DIAMOND-TRADE. During the past ten years the diamond-trade of the world has undergone great modifications. The old sources of supply in India and Brazil were practically exhausted many years before. Very few new stones were discovered, and diamond-mining had ceased to be remunerative. The few stones brought to Europe were almost wholly the remains of former findings slowly brought forth from their hiding-places. In 1868 diamonds were discovered in the interior of Southern Africa, and the field was soon found to be much larger and more prolific than those of Golconda and Brazil had ever been. The diamond region, vaguely known as Griqualand, having an area of about 17,000 square miles, was formally annexed to the British colony of the Cape. The actual diamond-fields are of very limited extent, and are scattered at wide intervals. The Kimberley mine, hitherto the most productive of all, has an extent of less than one square mile and a half. It appears to be nearly exhausted, but it is hoped that by digging deeper other diamond-bearing strata will be reached. For a dozen years and more the greater number of diamonds have been derived from this quarter, and it was supposed that so great an increase of supply would materially depress the market value.

A considerable proportion of the African diamonds are of inferior grade; of these there is an over-supply, and we are told by the most extensive diamond-dealer in New York that "low-grade diamonds are a drug in the market." He adds, however: "There is a constantly increasing demand for choice stones, and when such a one comes in our way we never fail to buy it, if it can be had at anything like a reasonable price; for we are sure that we need not wait long for a purchaser at almost any price we choose to name."

The weight of diamonds is always expressed in carats—a carat being equal to a little less than $8\frac{1}{2}$ grains troy; or, more exactly, one ounce troy is equivalent to 150 diamond carats. An ounce of pure gold is worth about \$20; an ounce of fine 1-carat diamonds would be valued at from \$20,000 to \$60,000.

But the value of diamonds increases in the geometrical ratio of their weight. The nominal rule is, square the number of carats of weight, and then multiply the product by the value of a single-carat stone. Thus, supposing a fine 1-carat stone to be worth \$200, a similar 2-carat stone would be \$800; a 3-carat stone, \$1,800; and so on.

Rough diamonds are rarely brought to this country, although they are admitted free of duty; cut diamonds pay 10 per cent. They

are usually sent to Europe to be cut; the chief places being Amsterdam and Antwerp, in which cities there are said to be not less than 6,000 workmen in this occupation. Diamond-cutting, however, has been introduced into the United States within a few years, and there are probably about 100 diamond-cutters here. There is every reason to anticipate that this occupation will be rapidly extended. Supposing the rate of wages to be the same in New York and Amsterdam, there would be a saving of 10 per cent. on the entire cost of a diamond by having it cut here. The actual cost of cutting is much less than is generally supposed. The cost of cutting a \$14,000 brilliant was not far from \$150.

Diamonds always lose more or less, and usually very considerably, in size and weight, in the process of cutting, and to estimate the probable amount of loss is one of the great problems of the diamond-merchant; hardly less important than the judging of the quality of the stone, which can rarely be certainly known while it is in the rough. The prices of rough diamonds of low grade, at the Cape, a year ago, averaged about \$7.50 per carat; they are now quoted at about \$13. Fine stones, of course, bring much more. The diamond-market at the Cape is mainly controlled by a number of European companies, with an aggregate capital of \$32,000,000. They operate measurably in common; work several of the principal mines, loan money to individual miners, purchase their findings, and transmit the stones through their agents to all the markets, of which the American is daily becoming more and more important, although as yet it is confined almost exclusively to cut gems of the finer grades.

Imports.—There appears to be no means of accurately estimating the value of the diamonds annually brought into the United States; for in the custom-house reports all kinds of jewels are put under one head as "precious stones." The reported value of these imports, in 1880, was \$6,698,000; in 1881, \$8,090,000; in 1882, \$3,444,000; and probably much greater in 1883, although the precise figures are not at hand. Diamonds themselves probably do not constitute a fourth, perhaps not an eighth, of this amount. But even supposing that the yearly importation of diamonds does not exceed \$1,000,000 or \$1,500,000, the aggregate for a series of years forms a very considerable addition to the sum of our accumulated and invested wealth; for it must be considered that whatever sum is thus laid up is one of the most permanent of investments. And if the purchases are judiciously made, this is one of the safest of investments. Diamonds never wear out; there is no known means of destroying them except by burning them; and few things are less likely to be lost by accident. They may indeed be stolen, and are of course a favorite object for thieves and burglars. But the most successful diamond robbery is far

less profitable to the perpetrator than might at first be supposed. The thief can not well display his plunder upon his own person; and he can rarely dispose of it except to some dishonest purchaser, and for a sum much below its real value. No reputable dealer will purchase so costly an article unless he is sure that the seller has a good title to it; and the whereabouts of any valuable stone is easily learned.

There is little likelihood that the taste for diamonds will diminish. Other precious stones may come into fashion, but diamonds will never go out of fashion; for, more than any other jewel, they combine the attractions which have brought them into universal favor. And, moreover, the number of those who are able to indulge in this costly luxury increases far more rapidly than do the products from any probable source of future supply. This applies more especially to the finer grades of stones; for inferior grades the opposite is true.

Counterfeits.—Diamonds are counterfeited so skillfully that only an expert can detect them with any certainty. There are imitations so perfect that an expert could not detect the difference, by the eye alone, by gaslight, at the distance of a few feet; but, let him take one of them into his hand and examine it closely, and he will never be at a loss to distinguish the genuine from the cleverest imitation.

The advertisements of "Parisian diamonds," or by whatever other name they may be called, which are "in all respects equal to the genuine ones," are fraudulent. It is said that some of these consist of a "surface of pure diamond," deposited upon a solid crystal base. No such thing is possible; there is no means known to science by which any such result can be produced. "Stage diamonds" are to be looked at by gaslight and at a distance, and serve all the purposes in view.

DIPLOMATIC CORRESPONDENCE OF THE UNITED STATES. The controversy between the United States Government and that of Great Britain regarding the construction and validity of the agreement of 1850, known as the Clayton-Bulwer Treaty, was continued at intervals during the year. In a dispatch to Mr. West, British Minister at Washington, dated Dec. 30, 1882, Lord Granville, British Secretary of State for Foreign Affairs, discussed the questions involved at great length, and announced the conclusions of his Government as follow:

The conclusions arrived at by her Majesty's Government, after a careful consideration of the questions raised in Mr. Frelinghuysen's dispatch, are that the meaning and effect of Article VIII of the Clayton-Bulwer Treaty are not open to any doubt; that the British Government have committed no act in relation to British Honduras, or otherwise, which can invalidate that treaty, and justify the Government of the United States in denouncing it, and that no necessity exists for removing any of the provisions of that treaty.

There might, perhaps, be advantages in defining by agreement the distance from each end of the canal within which no hostilities should be committed by belligerents, in order to maintain the freedom of the

passage through the Panama Canal, should that route be completed, and when the time approached for its completion her Majesty's Government would, no doubt, be prepared to give its careful attention to the question of concluding an arrangement with that object, should such a proposal be made to them, but in the present stage of the enterprise they conceive that it would be premature to enter upon negotiations for that purpose.

I have not thought it necessary to allude in this dispatch to the "traditional continental policy" of the United States as laid down in what is commonly called the "Monroe doctrine," since Mr. Frelinghuysen, in his note of the 8th of May last, in which he explained the views which were entertained by his Government on that subject, admitted that her Majesty's Government was not called upon either to admit or deny the views therein expressed.

You will state to Mr. Frelinghuysen that her Majesty's Government are animated by the most sincere desire to arrive at an amicable settlement of the questions which have given rise to this correspondence, and that they note with great satisfaction the friendly assurance with which he concludes his dispatch that the diversity of opinion which now exists will not in anywise impair the good understanding happily existing between the people and Governments of the United States and Great Britain.

The following is the response of the Secretary of State, transmitted through Mr. James Russell Lowell, the American Minister in London:

DEPARTMENT OF STATE, WASHINGTON,
May 6, 1883.

SIR: I inclose herewith copy of an instruction from Lord Granville to her Britannic Majesty's Minister in Washington, dated Dec. 30, 1882, a copy of which was handed to me by Mr. West, and which is a reply to the agreement contained in my No. 368 to you of May 8, 1882, on the subject of the Clayton-Bulwer Treaty.

You will remember that my No. 368 showed that the first seven articles of the treaty related to a particular canal then in contemplation, to aid the construction of which the treaty was signed; that the United States, being then without the means to build the canal, for which they had secured an exclusive grant from Nicaragua, naturally turned to England for capital, to secure which they were willing to surrender some of their exclusive privileges; and that, the canal never having been built, the reason for the surrender of privilege has ceased, and the treaty with Great Britain is voidable, being without consideration or any object to which it is applicable.

Lord Granville in his instructions to Mr. West in substance concedes that the first seven articles of the treaty related to what was then known as the Nicaragua Canal, but intimates an uncertainty as to the route. In this he is in error, for the line of the canal was definitely fixed soon after the conclusion of the treaty and accepted by both Governments.

His lordship, however, practically confines himself to an assertion of rights under Article VIII, by which the parties, "after declaring that they not only desired in entering into the convention to accomplish a particular object, but also to establish a general principle, agreed to extend their protection by treaty stipulations to any other practical communications, whether by canal or railway, across the isthmus which connects North and South America, and especially to the interoceanic communications, should the same prove to be practicable, whether by canal or railway, which are now proposed to be established by the way of Tehuantepec or Panama," and he claims that this provision is in effect an agreement that all the prior provisions with reference to the particular ship-canal—the Nicaragua route—then in contemplation, should be applied to any other canal thereafter constructed. Citing treaties between the United States and some of

the Central American states, he contends that the Government, having, since the Clayton-Bulwer Treaty of 1850, entered into treaties which harmonize with the "general principle," is estopped from denying that the eighth article has the construction and effect he contends for.

Lord Granville further holds that Article VIII is none the less an agreement because it provides for further treaty stipulations to carry it into effect. This argument has already been anticipated in my No. 368, in which it was shown that while the parties interested agreed, in Article VIII, to extend by further treaty stipulations their protection over other communications across the isthmus, the immediate object of the article was the protection of the communication "now" [1850] proposed to be established by the way of Tehuantepec or Panama. None of the proposed communications having been established, the reason for the agreement has disappeared.

Further, the article provides for carrying out the "general principle" by additional stipulations, which have not been even discussed. Nor is there anything in the eighth article which makes applicable to any other route the provisions of the first seven articles, covering the "particular object," viz., the Nicaragua Canal.

The eighth article, therefore, is simply a declaration of the intention entertained more than thirty years ago by two nations to take up, at some subsequent period, the negotiation of a treaty on a particular subject. In order to carry out this, further treaties must be made by the United States and England with each other and with each of the Central American states through which a canal may be built, defining in detail the stipulations necessary to execute the general principles.

It can not be successfully contended, as is suggested by Lord Granville, that the separate treaties made by this country with some of the Central American states, by which this Government agrees to guarantee neutrality, show an agreement to guarantee it jointly with Great Britain, for that would involve the admission that an express agreement to guarantee singly is in effect an implied agreement to guarantee jointly. Nevertheless, it is not denied that the United States did for many years try to induce Great Britain to fulfill her part of the agreement of 1850, and it was only when it became impossible for her Majesty's Government to perform the promises which had led the United States to make the treaty that the position now maintained was assumed.

If it be contended that even if the treaty may be considered as lapsed as far as it relates to the specific route by Nicaragua and the routes named in the eighth article as contemplated in 1850 (by Panama and Tehuantepec), yet the treaty is binding so far as it relates to other isthmian communications not specified and not then contemplated, the answer is that the treaty must be considered as a whole, and that the general stipulations of the eighth article would never have been made but for the stipulations as to the specified routes then contemplated, and, that part of the treaty having lapsed, the general stipulation as to any inter-oceanic communication fails for want of consideration.

To reach the construction his lordship seeks to put on the eighth article, its plain language must be disregarded, and the consideration must be ignored that the article is as applicable to the Panama Railroad as to any other means of isthmian transit, and that by acquiescence for many years in the sole protectorate of the United States over this railway, Great Britain has in effect admitted the justice of the position now maintained by the President.

Passing the interpretation of Article VIII, you will remember that I contended that the Clayton-Bulwer Treaty is voidable because, while by Article I the two nations expressly stipulated that neither of them would occupy, colonize, or exercise any dominion over any part of Central America, but Britain, at the same time, has a colony, with executive and judicial officers, occupying a defined territory nearly equal in area to

three of the smaller States of the Union. It is true, as was shown in my No. 368, that after the treaty had been ratified by the Senate in the form in which it now appears, and on the Fourth of July, 1850, Mr. Clayton did exchange with Sir Henry Bulwer memoranda stating that the stipulation in Article I should not apply to the "settlements in British Honduras (Balize)," and it is also true that Mr. Clayton declined to affirm or deny the British title in this "settlement" or its alleged dependencies. Lord Granville now claims that Honduras was then already (and to the knowledge of this Government) a British "possession" or colony by conquest from Spain through successful resistance by settlers to a Spanish attack.

The stipulations of the treaty, as well as the memoranda exchanged by Mr. Clayton and Sir Henry Bulwer relative to a British settlement, appear to be inconsistent with any such claim, for nowhere in them can be found any statement which expresses or implies that Great Britain claimed or the United States admitted any such governmental control in the former over Balize as is now advanced and as is necessarily implied in the word "possession."

The date of the conquest of Balizo alluded to by Lord Granville is not stated, but the incident to which he refers is supposed to be the repulse by a ship of the royal navy and the settlers of an attempt in 1798 on the part of Spain to take possession of the Honduras. As the British settlers held under grants from Spain, it seems hardly necessary to consider whether the successful resistance of a tenant to an attempt to oust by force, changes the tenure to one of full possession. His lordship, however, meets this point by a plea of possession through abandonment, saying, when peace was signed, "most of the British conquests from Spain were restored to her, but the settlement in Honduras, like that of the Falkland Islands, was not given up, and continued on the same footing as any other possession under the British crown."

By the third article of the Treaty of Amiens of 1809 Great Britain engaged to restore all Spanish possessions occupied or conquered by British forces. Balize was not given up, because it was not a conquest, but a settlement under Spanish grants and Spanish sovereignty. The parallel with the Falkland Islands does not seem convincing, for these islands were ceded by France to Spain in 1763. By Spain they were in turn ceded absolutely to Great Britain in 1771, but their possession was not abandoned until 1820. Buenos Ayres occupied the islands as derelict and colonized them later in 1831. After a difficulty between the settlers and American sealing-vessels the United States ship-of-war Lexington broke up the settlement and removed the settlers to Buenos Ayres, and it was not until 1833 that Great Britain enforced her claims under the cession of 1771.

As to Balize, however, there was no cession. If the sovereignty of Spain was annulled by conquest in 1798, it was restored by the Treaty of Amiens in 1802, and while after this treaty and during the Bonaparte occupation hostilities were renewed, the treaty of 1803 provided that there should be peace between Spain and Great Britain, and "also an entire obliteration of all hostilities committed during the late war." Since the conclusion of this treaty Spain and Great Britain have been at peace, and it is not imagined that Earl Granville will seek to show that a lawful possession could be thereafter created for Great Britain by a violation of that treaty in time of peace. No conquest of any part of Honduras is known to have occurred after 1802; but if there were, the perpetuation of this conquest would hardly comport with the reciprocal agreement of 1809 to restore the *status quo ante bellum*.

On the other hand it is known that the settlements in the Balizo were made under certain limited grants from Spain, subject to her sovereignty, and that long after the treaty of 1809 the occupation was generally regarded simply as a "settlement," and was so called by Lord Clarendon as late as 1854 in a note to Mr.

Buchanan, and so remained until May 12, 1862, when by royal commission it was erected into a full colony and subordinated to the Government of Jamaica.

If Great Britain has turned the "settlement" maintained for the cutting of logwood and mahogany into an organized British colony—and this is admitted—or if that settlement has encroached beyond the line occupied by the settlers in 1850—and the reports from Guatemala and Mexico tend to show that this has been done—the action has been taken in contravention of the Clayton-Bulwer Treaty, and in violation of one of its most important provisions. The insufficiency of this part of Lord Granville's argument is shown by the contention that through a postal convention this Government has recognized the British position. The negotiation of a postal convention in 1869 can not be held to involve any admission of the political status of the Balize district. It is a strained construction of such an agreement to hold that it works an estoppel as to a matter not in the mind of either party to the negotiation, and as to which both parties were endeavoring to reach a satisfactory conclusion through other and different channels; nor does the Post-Office Department act politically in its dealings with similar departments of other governments.

If, however, the United States had submitted to the conversion of the Balize to a colony by her Majesty's Government in violation of the treaty, that is by no means a recognition of the binding force of the treaty on the United States when thus violated.

In the conviction, therefore, that the arguments heretofore presented by the United States remain unshaken, the President adheres to the views set forth in the instruction to you of May 8, 1882.

Lord Granville concludes by saying in effect that he does not answer that part of the instruction to you which relates to the Monroe doctrine, because of my observation that it is not necessary for her Majesty's government to admit or to deny that doctrine. As his lordship placed the claim of her Majesty's Government on the continued binding force of the Clayton-Bulwer Treaty, limiting that doctrine, as we contend, I think my remark was logical, and so far as the United States are concerned their views on that doctrine are sufficiently manifest.

You will assure Lord Granville that this Government shares the sincere desire of that of her Majesty to arrive at that amicable adjustment of the question which can not fail to promote harmony and good-will between the two countries, and which it is my duty and pleasure, equally with his lordship, to do all in my power to perpetuate and increase.

You will take an early occasion to read this instruction to Lord Granville, and, if he should so desire, to leave a copy with him.

I am, etc.,

FREDERICK T. FRELINGHUYSEN.

The following is presumed to close the discussion for the present:

DEPARTMENT OF STATE, }
WASHINGTON, Nov. 22, 1883. }

James Russell Lowell, Esq., &c., London.

SIR: I inclose herewith a copy of an instruction from Lord Granville to her Britannic Majesty's Minister at Washington, dated Aug. 17, 1883, a copy of which was handed me by Mr. West, and which is in reply to my 586 to you of May 5, 1883, on the subject of the Clayton-Bulwer Treaty. You will observe that Lord Granville says that "Mr. Frelinghuysen still contends that the Clayton-Bulwer Treaty is voidable on two grounds—first, because the first seven articles of the treaty relate to a particular canal by the Nicaraguan route only; and, secondly, because Great Britain has, at the present day, a colony instead of a settlement at Balize." Lord Granville's attention should be called to the fact that this Government not only holds the position to which he has referred, but also holds, as stated to you in my instructions of May

8, 1882, and May 5, 1883, that for the purpose of obtaining the then needed capital to construct an inter-oceanic canal by the Nicaraguan route, the United States were willing to surrender a part of their exclusive privileges in a canal by that route, and were also willing to agree that, by subsequent treaty stipulation, they would join with Great Britain in the protection of the then proposed Tehuantepec, Panama, or other interoceanic communication, and that the consideration having failed, the treaty is voidable as to the Nicaraguan route and as to the other routes.

Lord Granville raises the point that no time was fixed by the convention within which such inter-oceanic communications were to be made. While this statement is correct, it is also true that it was contemplated that the canal was about to be constructed at the time the treaty was negotiated, and that the survey therefor was then made, and that thirty-three years have elapsed without Great Britain rendering the consideration on which the treaty was based, and this failure, we think, affects the treaty in the same manner that a failure by Great Britain to give the consideration within a definite time, had one been fixed by the convention, would have affected it. The treaty provides that neither the United States nor Great Britain shall colonize or exercise any dominion over any part of Central America. This was a most important provision. It is one of a cluster, restraining one nation from having any advantage over the other in regard to the police of the canal, such as the provision against alliance, against occupation and fortification, and against taking advantage of any intimacy or influence, and yet it is claimed that the treaty does not prohibit the existence of a large, regularly organized British colony in Central America, while it does prohibit the United States from having any possession or colony there. The color for this claim is, that while the stipulation that neither of the two Governments should colonize any part of Central America, is most conspicuous, the declaration of Sir Henry Bulwer, prior to the exchange of the ratifications of the treaty, states that "her Majesty does not understand the engagements of that convention to apply to her Majesty's settlement at Honduras or its dependencies." This declaration can not be held to authorize the subsequent colonization by her Majesty's Government of a territory as large as three of our smaller States. The declaration was made, not to change or vary the treaty, but of abundant caution that it might not be misunderstood. The meaning of the declaration, we think, is that a mere settlement of British subjects for the purpose of cutting mahogany and logwood at Honduras, under Spanish-American sovereignty, was not to be considered a British colony, and thus be a violation of the treaty, and I fail to see how, since the exchange of the ratifications of the treaty, the organization of a colony with a full colonial government, under the British sovereignty, can be looked upon as authorized or allowed either by the treaty or by Sir Henry Bulwer's declaration. The two contracting powers are equally bound not to colonize any part of Central America, and the declaration itself of Sir Henry Bulwer, not being the exception of any territory in Central America from the operation of the treaty, but providing in effect that the settlement should not be considered a British colony, tended to strengthen and not to destroy the mutual obligation not to colonize in Central America.

Lord Granville is correct in saying that I stated in my instruction to you of May 8, 1882, that her Majesty's Government was not called upon either to admit or deny the views therein expressed as to the Monroe doctrine, and this was so for the reason there given, to wit, because her Majesty's Government placed its claim to join in the protection of the interoceanic canal on a treaty which, if binding, certainly modified the Monroe doctrine. But the fact that this Government, for a promised consideration, modified by treaty what is called the Monroe doctrine I think does not in any manner affect that doctrine after the treaty has

fallen, because of its infraction and because of the failure of the consideration contemplated.

I observe that Lord Granville says that her Majesty's Government have reached the conclusion that a prolongation of this discussion is not likely to lead to any practical result, and also says that Great Britain has large colonial possessions and great commercial interests, which render any means of unobstructed and rapid access from the Atlantic to the Pacific a matter of the greatest importance to Great Britain. In the conclusion of this discussion, you may say to Lord Granville that this Government fully appreciates the importance to Great Britain of an unobstructed and rapid access from ocean to ocean, and has no disposition, as stated in my instruction to you of May 8, 1882, to impede Great Britain in the enjoyment of such an access, and that this Government believes that the two nations will, in due time, reach a satisfactory solution of the questions that have been considered in this correspondence. You may read this instruction to Lord Granville, and leave a copy of it with him should he desire it.

I am, etc.

FREDERICK T. FRELINGHUYSEN.

The trial and conviction in London of Patrick O'Donnell, an alleged citizen of the United States, for the murder in South Africa of James Carey, was the occasion of considerable correspondence covering the period from September 24th to December 15th.

Under the first-mentioned date Mr. Hoppin, the American secretary of legation in London, informed Secretary Frelinghuysen of the arrest of Patrick O'Donnell, and of his anxiety to have a solicitor appointed to undertake his defense. He further informed the secretary that, in response to a communication from the deputy-governor of Millbank Prison, he had stated that there was some doubt as to O'Donnell's identity. He had added that, supposing the prisoner's citizenship to be established, he did not believe it to be the duty of the United States Government under ordinary circumstances to provide professional legal assistance for one of its citizens accused of crime in Great Britain, even if he were destitute of means, and that there seemed to be nothing in this case to make it an exception. He had therefore declined to instruct some one to defend him, except under directions from the Department of State. Mr. Hoppin inclosed in his communication the letter of the governor in charge of Millbank Prison, and his reply thereto. Under date of Oct. 5, 1883, Secretary Frelinghuysen wrote to Mr. Lowell, directing him to ascertain whether O'Donnell was a citizen of the United States, and, if so, to do whatever was necessary to secure his proper defense. Inclosed in this communication was a letter from the Hon. John F. Finerty, of Illinois, transmitting resolutions adopted at a meeting in Chicago, urging upon the Secretary of State the necessity for immediate action by the United States to vindicate the right of O'Donnell to a fair trial. The reply of Secretary Frelinghuysen to Mr. Finerty was also inclosed, and in it the Secretary said:

It is not doubted that the accused will receive a fair trial according to the usual forms of law, which, in England, are substantially those in force in this

country, and that any proper aid to that end which it is within their power to furnish will be given by the representatives of the United States in London. Such aid would be given, as a matter of course, without specific instructions from this department, to any American citizen accused of crime in any foreign country where this Government is represented.

Under date of Oct. 9, 1883, Secretary Frelinghuysen inclosed to Mr. Hoppin the request of the Hon. John A. Logan and others that William F. Hynes and William W. O'Brien be authorized to appear in court on behalf of O'Donnell. He also inclosed his reply thereto, stating that he understood that Gen. Pryor and ex-Judge Fullerton, of New York, were to take part in the defense. Mr. Lowell being absent from London, Mr. Hoppin replied to the last communication, stating that he had come to the conclusion that the certificate of naturalization produced by O'Donnell was either granted to some other person "bearing the not unusual name of Patrick O'Donnell, or that it was fraudulently obtained by the prisoner." It is possible, he said, that the State Department may decide that the simple fact of the prisoner's possessing a certificate of naturalization in his own name is sufficient proof of his citizenship, without regard to antecedent facts. It seemed to him that O'Donnell's defense had been properly secured, and that it was not necessary for him to take any further steps in that direction. It was hardly necessary for him to show the immense inconvenience, if not absolute impracticability, of providing, as a matter of course, professional assistance for destitute American citizens accused of crime in all parts of the United Kingdom. Such action would throw upon the legation judicial duties which would materially interfere with its legitimate work, and would entail great expense upon the Government.

Under the date of October 23d, Mr. Hoppin informed Secretary Frelinghuysen that he had made further inquiries concerning O'Donnell's alleged citizenship, and while it was impossible for him to give an authoritative opinion upon the question, he could say that he was impressed with the apparent truth of O'Donnell's statements. The question of O'Donnell's citizenship was summed up in the following communication from the Secretary of State to the President:

In response to your direction I have the honor to inform you that an investigation was made of the right of Patrick O'Donnell to claim citizenship in the United States, the result of which I have the honor to communicate to you herewith. The statements made in behalf of O'Donnell's right to claim American citizenship are conflicting. It is asserted that he is a citizen, first, by the naturalization of his father, Michael, while he, the son, Patrick, was yet a minor; second, by reason of service in the army of the United States during the late civil war; and third, by naturalization as one who resided in the United States for the three years next prior to his coming of age, and continuously thereafter up to the time of his making application for citizenship. The claim to citizenship through his father's act rests upon his own state-

ments. No proof of the fact is found or furnished, and it is not confirmed by other members of the family that the father ever was naturalized. Had he been, Patrick O'Donnell need not have applied for naturalization. As to the second point, O'Donnell himself says that an injury to his arm prevented his enlistment in the army, but that he was employed as a teamster in 1864 on a United States Government supply-train in Colorado. It has not been thought necessary to verify this statement, for if true the fact would not give him the right to naturalization as one who had served in the army; and, moreover, the certificate is not granted on the ground of his having been a soldier. In support of the third allegation he produces a certificate of his naturalization on Nov. 6, 1876, by the Probate Court of Lawrence co., Ohio. This certificate was issued in conformity with section 2167 of the Revised Statutes, which provides that "any alien being under the age of twenty-one years, who has resided in the United States three years next preceding his arriving at that age, and who had continued to reside therein to the time he may make application to be admitted a citizen thereof," may be admitted on making the prescribed declaration at that time instead of two years before naturalization.

It would appear that this certificate was irregularly granted, for by O'Donnell's statement, made to the United States *chargé d'affaires* at London, he returned to Ireland after attaining majority, and remained there between 1868 and 1871, and consequently had not continued to reside in the United States from the time of his coming of age to the time of making application to be a citizen, as he must have done to conform to the requirements of the statute. It is also uncertain whether he, in fact, resided here for the three years next before attaining majority. By his statement to Mr. Hoppin he is now about forty-eight years old, which puts his birth about 1835. In the declaration of intention made at the time of naturalization he declares that he was born in 1838. He must therefore have attained majority somewhere between 1856 and 1859. By his own statements he came to this country with his mother (his father being already here) when about four or six years old (1839-1844), returned to Ireland when twelve years old (1847-1850), and came back to the United States in 1861, when he must have been between twenty-three and twenty-six years old; so that between the extreme dates assigned by himself, the three years next preceding his reaching majority would appear to have been spent in Ireland. The act of naturalization being, however, a judicial decision, it can only be impeached according to the rules established in the Spanish-American Commission, by showing want of jurisdiction on the part of the granting court, or fraud practiced by the applicant on the court, or that the naturalization was in violation of treaty stipulations.

Patrick O'Donnell has a certificate of naturalization. He may have obtained it by mistake of the court, or by his own mistake, or there may be mistakes in the statements he now makes, and yet be an absence of fraud, and as the certificate is *prima facie* evidence of citizenship, and as I do not see the evidence that O'Donnell practiced a fraud upon the court, the United States legation at London was instructed to consider O'Donnell's citizenship established.

Under date of Dec. 11th, Mr. Frelinghuysen telegraphed Mr. Lowell of the action of the House of Representatives, as contained in the resolution of Dec. 10th, repeated his former instructions to consider the citizenship of O'Donnell established, and concluded by saying: "There being in Great Britain no judicial examination or appeal of the proceedings at a criminal trial possible, errors can only be corrected through a new trial and by executive action upon the sentence. Therefore this Government is anxious that such careful examination be given to the proceedings in this case as to discover an error should one

have been committed. You are, therefore, directed by the President to request a delay of the execution of the sentence, and that a careful examination of the case be made by her Majesty's Government, that the prisoner be permitted to present any alleged points of error."

On Dec. 15th Mr. Lowell telegraphed to Mr. Frelinghuysen, acknowledging the receipt on Dec. 12th of his telegram of Dec. 11th, and stating that he immediately sent its substance to Lord Granville, who on Dec. 18th acknowledged its reception and stated that it had been referred to the proper authorities; that on the date of his telegram (Dec. 15th) Mr. Lowell received the final decision in the following words:

"Sir: With reference to my letter of the 18th inst., I have now the honor to state to you that the counsel for O'Donnell, having submitted such representations as he thought advisable on behalf of the prisoner, these representations and all the other circumstances of the case have been carefully examined and considered in the manner usual in the case of capital convictions, and her Majesty's Government find no grounds upon which they would be justified in advising the Crown to interfere with the sentence of the law or its execution. I have, etc., GRANVILLE."

The resolution of Dec. 10th, referred to, called on the Government to interpose, to prevent, if possible, the carrying out of the sentence of death on O'Donnell, on the ground that he had not had a fair trial.

DODGE, William Earl, an American merchant, born in Hartford, Conn., Sept. 4, 1805; died in New York city, Feb. 9, 1883.

The family from which he sprang was English, and the first of the name who emigrated to America was William Dodge, of Dorsetshire. He came to Salem in 1629, and was one of the founders of the Massachusetts Bay Colony. The father of William Earl was David Low Dodge, who had been a successful merchant in Hartford, and removed to New York city in the same year in which his son was born. He retired from business in 1827, and devoted the rest of his life to literary and benevolent work. Several valuable books were published by him; he was a zealous and energetic member of the Presbyterian Church, and was an elder of the old Wall Street Church. His wife was the daughter of Rev. Aaron Cleveland, a minister of some note.

William Earl Dodge entered upon active life as helper to his father, when he was only a boy. In early life he united with the Lighthouse Street Presbyterian Church. On reaching manhood he engaged in business for himself, with a partner, the firm being Huntington & Dodge. Three years later, he married a daughter of Anson G. Phelps, and in 1833 entered into partnership with his father-in-law, the firm being Phelps, Dodge & Co., and he remained one of the senior members until 1879.

Mr. Dodge was one of the first directors of the Erie Railway, and fully appreciated its importance in the near future; but in the case of this as well as of other corporations, he wholly disapproved of compelling Sunday work from the employes, and refused to serve in any board which caused trains to be run on Sunday, or derived profit from Sunday labors. He was one of the founders and promoters of the

Mutual Life Insurance Company. He early became a member of the Chamber of Commerce, and was for three terms chosen to be its president. He was an active manager and friend of

WILLIAM EARL DODGE.

the American Bible Society, was a trustee and benefactor of Union Theological Seminary, and was among the most zealous of the founders of the Union League Club.

In 1844 Mr. Dodge found it necessary to make a voyage to Europe for his health. In 1872 he visited the East, and laid the cornerstone of the Syrian Protestant College at Beyrout. He also visited England in 1881, and made an eloquent and forcible address regarding the English and Foreign Bible Society and its works.

Mr. Dodge devoted both time and money to the support of the Government during the civil war, and was a member of the Thirty-ninth Congress. Later, President Grant appointed him one of the Indian Commissioners, and he visited the Territories, and made himself personally acquainted with the Indian question in all its important phases.

Active, unceasing benevolence and good-will to men marked his whole course. He was specially a friend and helper of the freedmen, and was a patron and benefactor of Lincoln University for colored men. He was President of

the National Temperance Society, and aided in establishing in New York a temperance Christian home for men, and also a like home for women. Only ten days before his last, fatal attack he delivered in the Tabernacle, West Thirty-fifth street, an interesting lecture entitled "Recollections of Fifty Years."

Although now considerably beyond three-score years and ten, Mr. Dodge in no wise slacked his efforts to do good. Premonition came, the Saturday before his death, in an attack of angina pectoris. Yet, with undaunted courage, he nerved himself for whatever work was before him to accomplish. On Friday, February 9th, he rose as usual; but the summons had come, and, supported by the arms of his loved ones, he was laid on his bed and passed away. The funeral services were held on the 12th inst., in the Church of the Covenant, Park Avenue, of which congregation he had for fifteen years been an active and honored member.

In addition to unnumbered gifts and charities during his lifetime, Mr. Dodge left by will sums of \$50,000, \$20,000, and \$10,000 to various charitable and educational institutions.

DORE, Gustave, a French artist, born in Strasburg, Alsace-Lorraine, Jan. 10, 1838; died in Paris, Jan. 23, 1883. At a very early age he manifested unusual talent and passion for drawing, and was sent to the lyceum of his native city. He was only eleven years old when his first lithographs were published, and excited much attention as coming

from a boy of that age. In the following year he accompanied his father to Paris, and was sent to the Charlemagne Lyceum, for the purpose of completing his education and training for the life that seemed to be opening to him. In 1848 he published his first series of sketches, "The Labors of Hercules," which were prepared for the "Journal pour rire." They were so satisfactory, and well adapted to the objects of that journal, that the youthful artist became one of its regular contributors.

At the age of twenty Doré began to exhibit oil-paintings, and the next year (1854) he established his reputation by illustrating the works of Rabelais. He contributed largely to the "Journal pour tous," which was founded in 1856, and that same year he gave to the public a series of charming pictorial commentaries on Balzac's mirthful "Contes Drolatiques," and on the well-known legend of the Wandering Jew. These latter, though having a considerable element of the grotesque, bear the stamp of Holbein and Albert Dürer, together with the quiet humor of Hogarth.

In 1861 he was decorated with the Cross

of the Legion of Honor. His whole time and attention were given to his profession, and he worked with a diligence and executed with a rapidity almost incredible. His drawings and sketches number by the thousands (estimated at 45,000 to 50,000), and, however imperfect and extravagant some of them may

be, owing to this dashing style of production, they yet display as a whole genius and power in a high degree.

GUSTAVE DORÉ

The most prominent of the works illustrated by Doré are those of Montaigne (1857), Taine's "Voyage aux Pyrénées" (1859), Chateaubriand's "Atala" (1862), Tennyson's "Idylls of the King" (1866-'68), and the fables of La Fontaine (1867). In 1861 he published seventy-

six large drawings in illustration and exposition of Dante's "Divina Commedia," accompanied by a blank-verse rendering of the text by William Michael Rossetti; and two years later appeared a very remarkable series of folio illustrations to "Don Quixote," which bear the marks of careful study from Spanish life. In 1865 he published his striking illustrations of Milton's "Paradise Lost," and during that and the following year completed a series of illustrative sketches and paintings on scenes and characters in the Bible. Among the oil-paintings exhibited by Doré, and worthy of note, are the "Two Mothers," "Alsatian Women," "A Mountebank with a Stolen Child," and some landscapes. The most noteworthy of his pictures are, scenes from Dante, especially his "Paolo and Francesca di Rimini," the battles of the Alma and Inkerman, in the Crimean War (1855-'57), the "Rebel Angels cast down" (1866), the "Gambling Hall at Baden-Baden," the "Neophyte" (1868), the "Triumph of Christianity," and "Christ leaving the Prætorium," which latter measures thirty feet by twenty.

Doré's popularity was very great, and his works have had a very large sale. There was hardly any subject which he did not undertake, from sublime epics and the sacred scenes and characters of Holy Writ, down to the broadest farce, or nursery and fairy tales. He had all the dash and vivacity of the French race, and he displayed marvelous vigor, imagination, and keen insight in his best works. English critics complain of his deficiency in taste and refinement, his lack of sensibility and deep feeling, and his frequent carelessness and slovenliness. It must be admitted that the criticism is in a measure just; yet at the same time Doré was one of the greatest artists France has ever produced, and has furnished to the world works of high order and unquestionable merit.

E

EARTHQUAKES AND VOLCANIC DISTURBANCES IN 1883. The year 1883 witnessed, in addition to at least the usual number of disturbances of ordinary intensity, two memorable and disastrous convulsions in two of the principal seats of volcanic activity remaining on the earth's surface—Southern Italy and the island of Java. A strong earthquake-shock was felt in Sicily early in May, and several others at different times subsequent to the eruption of Mount Etna in March. At Tabriz,

in Persia, an earthquake occurred on May 5th, which caused considerable loss of life. One in Mexico, on the 4th of August, caused 20 deaths. A village in Tyrol was badly damaged by another. The shocks in Chios and Asia Minor, the scene of frequent seismic disturbances, were more serious. There were shocks in Cordova, Seville, Cadiz, and throughout Anatolia, on October 24th, which were supposed to be connected with the Anatolian earthquake.

In *Ischia*.—A shock occurred on the island of *Ischia*, in the Bay of Naples, at 9.50 P. M. on the 28th of July. The towns of *Casamicciola*, *Forio*, and *Lacco Ameno* were almost entirely destroyed, with terrible loss of life. *Serrara*, *Fontana*, and other smaller villages, suffered much damage. The shock was felt in the town of *Ischia*, where it was severe enough to injure some of the buildings. The vibrations traveled great distances, and were even indicated by the seismograph in Rome. The number of deaths was estimated at from 2,000 to 3,000; the number of persons maimed and injured was about 600.

This island is one of the most attractive bathing resorts in Europe. The resident population is about 26,000, and there are usually several thousand summer visitors; but there were fewer than the ordinary number at the time of the catastrophe. The village of *Casamicciola* is much visited for its thermal waters. It was only two years since this place was half destroyed by an earthquake, March 4, 1881; but its attractions as a sanitarium and summering place were sufficient to outweigh the dangers.

A pantomime performance was going on in a summer-theatre in front of the large *Manzi* health establishment, and in the hotels the guests were assembled in the music and reading-rooms, when the catastrophe occurred. In fifteen seconds the village was a heap of ruins. A deafening subterranean roar accompanied the shock, which was followed by slighter vibrations, that brought the tottering buildings to the ground. Those who were not crushed under the ruins, or struck down by falling fragments after gaining the street, rushed with cries of terror to the beach, and, seizing every boat and floating thing, sought safety on the water. In the theatre and hotels every light was extinguished, and blinding clouds of dust enveloped the whole village in darkness. The *Établissement Manzi*, *Grand Hôtel*, *Villa Sauvet*, and *Grande Sentinella* escaped with comparatively little damage; but the other hotels and boarding-houses, among them the *Piccola Sentinella*, the favorite inn of English and American visitors, were destroyed, with most of their numerous inmates.

The village of *Casamicciola* and the landscape surrounding it were so completely obliterated that no feature of the topography could be recognized. The ground was rent with deep cracks several inches wide. Of most of the houses and villas nothing was left but indistinguishable mounds. In some places landslips carried away roads and vineyards.

Firemen and sappers and miners arrived immediately to disinter the dead, and rescue those who were still living under the *débris*. King *Humbert* came with his staff to encourage and aid the distressed, and public and private relief was extended to the thousands who were deprived of the means of subsistence. In *Forio*, *Lacco*, and *Serrara* hundreds of peasants were

killed, and a great number of houses were destroyed. *Barano* suffered considerable damage. The census of 1881 makes the total number of inhabitants in the island 26,908, of whom 6,574 dwelt in the town of *Ischia*, which escaped injury. The population of the communes in the main part of the island which were affected was as follows: *Forio*, 6,791; *Barano*, 4,598; *Casamicciola*, 4,217; *Serrano-Fontana*, 1,972; *Lacco Ameno*, 1,761.

The island of *Ischia* is entirely of volcanic formation, with the exception of a number of argillaceous elevations of marine formation. The village of *Casamicciola* was built upon such a clayey deposit, produced by the disintegration of the tufa of the volcano of *Epomeo*, which stands in the center of the island. *Lacco* stands partly upon this tufa, which forms the foundation of the island, and partly upon an overlying deposit of trachytic lava. *Forio*, on the west coast, as well as the villages in the south of the island, is built upon tufa. The distribution of hot springs, stufas, or jets of steam, and fumaroles on the island indicates the existence of two clefts in the tufa, one extending in a curved east-and-west line near the north coast, and the other crossing the island in a transverse direction. *Casamicciola* stood at about the intersection of the two lines of fracture. At *Casamicciola*, *Forio*, and *Lacco Ameno* the shock was at first vertical, then undulatory, the wave traveling at *Forio* from northeast to southwest, at *Lacco Ameno* from southeast to northwest, and at *Casamicciola* first from west to east and then from north to south. For several days previous to the earthquake slight shocks, accompanied with rumblings, were perceived. The springs of *Gurgitello*, near *Casamicciola*, showed irregularities of flow and temperature. The fumaroles of *Monte Cito*, south of that village, which are usually almost entirely inactive, gave strong indications of volcanic action, emitting jets of steam and sulphurous acid, and giving forth a strange hissing sound.

The source of the disturbance is supposed to be the expiring volcano of *Mount Epomeo*, the residual activity of which is manifested in the thermal springs and jets of gas and steam arising through the two fissures. Prof. *Palmieri*, of Naples, attributed the excessive violence of the shocks at *Casamicciola* to the existence of great caverns underneath the spot, the supports of which were weakened by the action of thermal waters, and gave way when agitated by the seismic shock. Others explain it on the hypothesis of the two fissures intersecting there, which would make *Casamicciola* the center of any volcanic disturbance on the island, and upon the theory of *Mallet*. This theory is, that a seismic wave passing from a comparatively inelastic soil to one of great elasticity changes its direction as well as its velocity, and is partly refracted and partly reflected. East of *Casamicciola*, between it and *Ischia*, are the volcanoes of *Rotaro* and *Mon-*

tagnone and their trachytic deposits, as well as the lavas of Arso. The wave passing from the inelastic clayey soil into the trachytes was greatly diminished in violence, which explains the slightness of the damage in Ischia, while its recoil was destructive to the buildings of Casamicciola.

Eruption of Etna.—An eruption of Mount Etna began March 20th, attended by ninety-two shocks of earthquake the first day, followed by slighter waves, and then, on the 22d and 23d, by three severe shocks at Nicolisi. The principal crater poured forth a dense cloud of smoke and fine ashes and a column of fire. After the shocks felt at Nicolisi, eleven new mouths opened above that place, which emitted sand, scorise, lapilli, and smoke, accompanied by loud roarings. Other shocks were felt, but the new craters, after discharging a great quantity of gas, became quiescent by the 30th. Earthquake convulsions continued intermittently for several days.

Krakatoa Eruption.—The activity of the Javan volcanoes in August produced one of the most terrific and disastrous convulsions of nature known to history. The populous and productive island of Java is, as a seat of volcanic phenomena, remarkable among all the volcanic regions of the globe. There are forty-five active craters on the island, besides those on the adjoining volcanic isles of the Straits of Sunda, the largest of which islands are Krakatoa, opposite the town of Anjer, and Sebocke and Sebesie near the coast of Sumatra. On Krakatoa the Dutch Government maintained a fort and garrison. The other small islands are uninhabited. There are multitudes of hot springs and other forms of volcanic activity besides the volcanoes themselves, notable among which are the mud-volcano at Grobogan, the gas-fountains, called the "holy fires," at Melati Derat, and the Pakaraman or Guiva Upas ("Valley of Death").

Earthquakes and eruptions are of frequent occurrence. The inhabitants experienced several appalling disasters before the crowning catastrophe of 1883.*

On the night of Aug. 26th detonations from the island of Krakatoa were heard at Batavia and as far as Soerakarta, forty-five miles distant. In a few hours showers of stones and ashes began to fall at Jogjakerta, Serang, Sourabaya, and Samarang. Red-hot stones fell all through the night, and ashes shrouded the towns in darkness. In Batavia there were also showers. The bridges were destroyed and all communications cut off with Anjer.

By morning the disturbance had extended beneath the waters of the strait. The sea be-

gan to boil and hiss, and huge waves were dashed upon the opposite coast of Java. The temperature of the water rose twenty degrees.

The rumblings became louder and more distinct in Java. At noon an eruption burst from the Maha Meru, the largest of the Javan volcanoes. Gunung, the crater of which is the largest in the world, being four miles in diameter, was soon involved. The eruptions extended to the Gunung Guntur and the minor cones, until more than a third of the active craters were in a state of eruption or gave signs of breaking out.

The Gunung Guntur was wrapped in a luminous cloud just before dusk, and began directly to emit enormous jets of white acid and sulphurous mud, with smaller quantities of lava. Detonations were heard in rapid succession. After each explosion great volumes of ashes and huge pieces of rock were hurled a great distance in the air, and fell in the valleys on all sides, covering the whole country and destroying a vast number of people in their habitations. The sea rose in great banks of water, in response to the outburst of the volcano. The clouds were surcharged with electricity, and not fewer than fifteen large water-spouts were witnessed at one time.

The eruption of the Gunung Tengger formed an impressive scene. Above its top, which is 6,000 feet in altitude, stood a towering pillar of flame. This volcano has been dormant since 1800, when an eruption buried 120 square miles of country under a sheet of the white sulphurous mud peculiar to the Javan volcanoes. This crater now sent forth a constant succession of glowing boulders which hailed down on the dwellings of the Chinese fishermen and native agriculturists, destroying every living thing.

The sides of the mountains opened in long fissures, and great chasms appeared here and there in the valleys. The showers of stones, mud, and lava did not overwhelm the elevated plains of Kediri and Bandong so completely as they did the lower portions of the island. The forests which covered a considerable portion of northern Java were fired by the volcanoes. The fields of coffee, rice, sugar, indigo, and tobacco were covered with mud, stone, and lava. Not a single crop was saved. As the volcanoes became more violent, the sea surged more tumultuously. The lava, as it reached the shore and poured over the crags into the sea, was congealed by the waves in fantastic forms of variegated bright colors.

The large town of Telokbetong, in Sumatra, was submerged by the tidal wave, and annihilated with all its inhabitants. The fortress and settlement of Anjer was overwhelmed by the tidal wave which followed the eruption of Krakatoa, and 200 white people were lost. Of the 3,500 Europeans and Americans in Batavia, several hundred lost their lives; of the 25,000 Chinamen who lived along the shore in front of the town, the greater part were swept

* In 1878 there were sixteen distinct earthquakes registered throughout the island. In 1848 Mount Guntur flung forth 80,000,000 tons of ashes and sand. By the great eruption of Mount Galung-gung in 1822 no fewer than 114 villages were laid waste, and 4,000 persons killed. In 1867 an earthquake caused the death of 1,000 people of the town of Jogjakerta alone. The eruption in 1872 of Merapi, one of the most active of the sixteen principal volcanoes, proved fatal to thousands of the inhabitants of Kadu. In 1879 the Preanger Kingdoms were convulsed by several severe shocks.

away by the waves. Tjiringin, south of Anjer, on the coast, was destroyed by the waters. Bantam, formerly a prosperous city, but subsequently abandoned by its European and most of its native inhabitants, was entirely submerged, and from 1,200 to 1,500 persons were drowned. The waters covered the island of Serang, on which not a soul was left alive. At Cheribon the falling of stones and flow of lava caused considerable losses of life and property. Buitzenborg, Samarang, Jogjakerta, Sourakerta, Sourabaya, and all the smaller towns were partially destroyed. Some of the "thousand temples" of Brambaman were destroyed, and a number of the domes of the famous temple of Borobodo were crushed by falling rocks.

The volcanic disturbance altered the geographical features of the Straits of Sunda. The great island of Krakatoa disappeared. Between the sunken island and Sebesie emerged sixteen new volcanic peaks. The Soengepan volcano split into five. The mountain of Kramatan, a high peak which formed the southeasterly promontory of Sumatra, sank into the sea. The changes were confined to the portion of the strait lying between this point and Krakatoa, the upheaval in the center of this strip producing a depression at both ends.

Alaskan Volcanoes.—Mount Augustin, near Cook's Inlet, burst into activity in October, and the eruption extended to two volcanoes, lying westward of Mount Iliamna, which were before considered extinct. Flames and smoke, preceded by an explosion, began to issue from the summit of Mount Augustin on the morning of Oct. 6th. The sky was obscured, and pumice ashes fell at the entrance of Cook's Inlet to the depth of five inches. A tidal wave 80 feet high washed upon the shore in the middle of the afternoon, followed by two others 18 feet high. The sky was brilliantly illuminated at night. The northern part of Mount Augustin was torn away by the eruption and leveled to the height of the surrounding cliffs. A new island, 75 feet high and 1½ mile long, appeared between Ohernaboura Island and the mainland.

Earthquake in Anatolia.—Severe shocks of earthquake were felt on the 15th of October along the coast of Asiatic Turkey, and on the island of Chios. The town of Aivalik, in Anatolia, was partly destroyed. Great damage was done to the villages between Tchesme and Vourla, and a large number of people were left roofless and without means. The city of Smyrna suffered injury to a slight extent, and the shock was felt also at Syra on the Dardanelles. In Chios a number of buildings were shattered and people wounded. In Vourla, Alateuki, Ovadere, and eight other villages near Tchesme, 57 persons were killed, 150 injured, and 14,678 rendered homeless.

ECUADOR. The modification of the territorial division of this republic, alluded to in the "Annual Cyclopædia" for 1882, proves not to be permanent, as since then the revolution has triumphed, and the dictator, Ignacio de Vein-

temilla, after whom the new province was named, has fled the country.

The provisional President of Ecuador is Señor José María Plácido Caamaño; the provisional Vice-President is Señor Rafael Perez Pereja.

The new Cabinet at the close of 1883 was composed of the following ministers: Interior and Foreign Affairs, Señor Pablo Herrera; Finance and Public Works, Señor V. Lucio Salazar; War and Navy, Señor Agustin Guerrero.

During the recent civil war and since its termination no later official returns relating to the finances of Ecuador have been published, nor has anything transpired with reference to the foreign debt.

Events of 1882.—After some desultory warfare following the opening campaign and the various engagements between the insurgent forces and those of the Government, from October, 1882, to January, 1883, chronicled in the "Annual Cyclopædia" for 1882, the former had gradually repelled the latter and ejected them from Guayaquil, and in April, 1883, had gathered at Guaranda, Babahoyo, Machala, Santa Rosa, and Manabi, thus forming a vast semicircle hemming in Guayaquil. Meanwhile the provisional Government at Quito declared Machala, south of Guayaquil, a port of entry, reducing the import duties there by 25 per cent. and the export duty by 50 per cent.

Early in May the combined insurgent or constitutional forces made a forward movement on Guayaquil, Gen. Alfaro's besieging army pressing from the west, while Generals Barona and Flores came forward from the north, Generals Salazar, Sarasti, and Landázuri from the east, and Generals Secundino, Darguea, and Medina moving onward from the south. A concentration for siege operations took place at Mapasingue.

On May 3d the Italian war-steamer Vittor Pisani approached the insurgents' camp, and the commander requested its captain to protect the lives of Italians and other foreigners in the event of an assault on the besieged city, which was promised him.

Representatives of Veintemilla under a military escort took, on May 8th, forcible possession of \$320,000 on deposit in the vaults of the Bank of Ecuador, Guayaquil, despite the protests of foreign consuls and the commanders of British and Italian men-of-war.

On May 15th Señor Antonio Flores, son of the first President of Ecuador, arrived at Guayaquil. He had been exiled by Veintemilla, and on his arrival the latter proceeded to arrest him, but was prevented by the commander of the British sloop of war in the harbor, who sent some boats with crews to protect Flores.

Being foiled in this attempt, Veintemilla made offers to Flores to resign into his hands the dictatorship, provided Flores would continue to oppose the Constitutionals and assist Veintemilla in pacifying the country. These offers were declined by Flores, who, on the

contrary, chose to join the insurgents. The commander of the *Constance* thereupon placed a boat at his disposal, which landed him at Sambarondon, one of the camps of the latter.

The besieging forces, 5,000 men strong, approached the fortifications of the city on May 22d. Some shots were exchanged, and the next day shells were thrown into the place. Veintemilla took part in the defense, and exposed himself fearlessly on the ramparts. His force numbered 3,000 bayonets, and he had 60 pieces of artillery in position.

On May 26th-27th the besieging forces temporarily withdrew from the immediate approaches, while the Colombian generals in the insurgents' camp, Generals Sarmiento and Montujar, proceeded to Ipalio to observe the movements of Veintemilla.

On June 3d the assailants again approached the city, and a lively cannonade was opened on it, followed by an attack on Forts Manicomio, Salado, and Puerto de Lisa, the northwestern portion of the fortifications. After the firing ceased, on June 4th, a summons to surrender at discretion was forwarded to Veintemilla, but rejected by him.

During the lull in siege operations which now occurred, Veintemilla was busy in perfecting his intrenchments.

On June 13th there was a general panic in Guayaquil, in consequence of the disorderly conduct of the garrison.

On June 19th an earthquake shook down the church and curacy of the village of Toacaso, in the interior of Ecuador. The other houses resisted the first shock, but a second shock took place about midnight, which destroyed every house. The ground opened in many places, and during the night sixteen shocks were counted.

About this time a gang of bandits paid a visit to the towns of Manta and Montecristi, where they murdered several persons and plundered a large amount. Some of the citizens resisted, and several of them were killed.

On July 9th, before daylight, the assailing army at Mapasingue advanced on Guayaquil in six divisions, and, after a two-hours' struggle, Gen. Reinaldo Flores and his brother Antonio at the head of their troops had taken the most important points by storm. The resistance was generally feeble, but the main fort held out vigorously. The townspeople received the troops with enthusiasm.

Veintemilla, accompanied by a number of officers and 200 soldiers, now fled, being conveyed to Payta, Peru, on board the steamer *Santa Lucia*, whence he sailed for Callao on July 21st, and thence reached Lima.

Alfaro at once organized a municipality, and on July 25th the people of Guayaquil spontaneously proclaimed Pedro Carbo chief of the government there. Meanwhile the three insurgent governments agreed to convoke a national convention; these three governments were: that of Alfaro, whose power extended along

the coast (Manabí and Esmeraldas), the government of Guayaquil under Pedro Carbo, and the one at Quito. Hence a decree was issued to the effect that delegates should assemble at Ambato, on October 9th, to elect a provisional President and Vice-President.

On August 6th Miguel Valverde was appointed a member of Alfaro's Cabinet as successor of Señor Semblantea, deceased.

On August 10th Gen. Alfaro left for Manta with 1,000 troops and several guns, on the plea that provisions were wanting at Guayaquil for so many troops; simultaneously Sarasti left with a force likewise, each taking with him \$100,000 raised on the spot. The motives of both were alleged to be political.

During the last week in August, earthquakes were felt at Manabí, Ecuador. Detonations were heard there, inducing the belief that fighting was going on in the neighborhood; troops were turned out ready to meet the supposed enemy. On September 2d the sun at Guayaquil was discolored.

Gen. Alfaro before his departure made a contract with Mr. M. J. Kelly, an American, for the construction of about 800 miles of telegraph to connect Bahía, Manta, and Esmeraldas, and other important towns in the lower provinces, with Guayaquil and the cable line.

The convention met on the day designated, 63 members being present, who, on October 15th, elected as provisional President of Ecuador, José María Plácido Caamaño, of Guayaquil, and provisional Vice-President, Rafael Pérez Areja, of Quito.

In the mean time, on account of old age, Don Pedro Carbo resigned his governorship of Guayaquil.

The convention before it dissolved declared in force the Constitution of 1861, and passed a bill for the encouragement of viticulture in Ecuador. This law exempts from all taxes whatsoever, both national and local, those who plant their acres with vines, and it furthermore liberates from military service, in the national army and the militia, all laborers working in vineyards, in the proportion of one thus privileged field-laborer for every two and a half acres of vineyard.

During the first week in December the ground opened in many places at Chimbo, a little village in Ecuador, forty-five miles from Chimborazo; smoke and flames rushed out, and lava and ashes were ejected. It was believed that a new volcano was in course of formation. The whole range in which the eruption has occurred is intensely volcanic.

On December 14th Gen. Eloy Alfaro arrived at Panamá from Guayaquil.

Climate and Resources.—The rainy season generally lasts from December to June, the remaining months being dry; but on the Amazon slope it rains all the year round. As to the influence of the climate on man, there are vast healthful districts in the river valleys of the Amazon region, while those of the Pacific

shore are commonly full of disease. Special disorders are due to the lack of sanitary measures. In the western and northwestern parts the abuse of sweets as food results in a curious and frightful intestinal complaint. The country is almost wholly agricultural, the Pacific coast and river valleys of both east and west yielding generous crops of cocoa, cotton, sugarcane, rice, coffee, tobacco, and tropical fruits, while the inter-Andean plateau produces all the cereals and vegetables incident to a temperate and even cold climate, though they are of inferior quality. Cattle do not thrive in the Amazon section, chiefly from the immense number of bats which irritate them.

Cinchona-bark, which first came from the province of Loja, is being so rapidly cut and sent out of the country, without new planting, that the supply must soon cease.

Population.—The population is estimated at 1,000,000 (exclusive of savage tribes), and is distributed as follows: white, 100,000; mixed, 800,000; pure Indian, 600,000. The evil qualities of the mixed races are condemned as the source of the degradation of the country.

Internal Communications.—Internal communications are much needed in Ecuador, and, although Col. Church is personally interested in the construction of future railroads, he expresses his strong opinion that for the next ten or twenty years a thorough system of first-class mule routes would undoubtedly be best.

Railroads.—The railway from Yaguachi to the river Chimbo is finished; 77 miles are thus in operation.

Telegraphs.—Ecuador has been in communication with the world's cable system since Oct. 1, 1882, through the land line from Guayaquil to Ballenita, whence the Central and South American Telegraph Company forwards the messages *via* Tehuantepec, Galveston, etc.

Commerce.—There entered the port of Guayaquil, in 1882, 212 vessels (112 of which were steamers), of a total tonnage of 125,294, counting coasting schooners and sloops.

Exports amounted in 1882 to \$5,469,798, comprising 21,877,200 pounds of cocoa, worth \$3,867,896; cinchona or cascarilla bark (quinine), \$319,950; tagua or vegetable ivory, \$418,600; India-rubber, \$1,045,708; straw (Jipijapa) hats, coffee, hides and skins, etc., making up the rest.

Cocoa Production.—The production of cocoa has been disastrously affected by the civil war, and, as Ecuador furnishes more of the article than any other country, the price has been enhanced in consequence all over the world. The December (1883) receipts at Guayaquil were only 10,500 quintals, and the price of Arriba cocoa advanced on Dec. 31, 1883, to \$19 per quintal of 100 pounds Spanish (101½ pounds American). The cocoa crop for five years has been:

	Quintals.		Quintals.
1879	502,490	1882	198,580
1880	582,990	1883	146,700
1881	507,280		

EGYPT, a principality of Northern Africa, tributary to Turkey. Mehemet Ali, the governor, rebelled against the Porte in 1811 and assumed the powers of government. In 1841 he was recognized, under the guarantee of the five great powers of Europe, as Vali, or Viceroy, and the sovereign authority was made hereditary under the Turkish law of succession. In 1866 Ismail obtained a firman creating him Khedive, or King, and establishing direct male succession by primogeniture, in return for which concessions he submitted to the increase of the annual contribution to the Sultan's civil list from \$1,880,000 to \$3,600,000. By another firman, issued in 1878, he obtained the rights of concluding treaties and maintaining an army. In August, 1879, the Sultan was induced to depose Ismail I, who was involved in financial difficulties. His son Tewfik was placed on the throne, and the government was administered under the supervision of two Controllers-General, appointed one by the French and one by the British Government, who were given the right of investigation into all departments of the public service and an advisory voice at the councils of the Cabinet. By a second decree of the Khedive, issued April 5, 1880, an International Commission of Liquidation was appointed to elaborate a financial law to regulate the relations of Egypt with her creditors. The scheme, consolidating the foreign debts, fixing the interest at 4 per cent., and reserving certain revenues to meet it, was sanctioned by the Khedive in 1881. That same year a political movement was set on foot to deprive the Controllers of the extraordinary powers they had assumed over legislation and administration, and place the powers of government in native hands. The French and English Governments refused to accede to the demand, in the beginning of 1882, for the transfer of legislative powers to a Chamber of Notables. The movement, which was accompanied by military preparations, was treated as a military rebellion. The British Government sent an army to occupy Egypt, the French Government declining to join in the intervention. The Egyptian army under Arabi Pasha resisted the occupation, and was finally subdued in September, 1882. It was then disbanded, and English officers were intrusted with the tasks of organizing a new military establishment and a gendarmerie, while the Earl of Dufferin, British ambassador at Constantinople, was sent to Egypt to work out a scheme for the reform and reorganization of the Government.

The Government.—The reigning Khedive is Mehemet Tewfik, son of Ismail I, who was born in 1852, and succeeded his father Aug. 8, 1879. The ministry at the beginning of 1883 consisted of the following-named persons: President and Minister of Foreign Affairs, Sherif Pasha; Minister of the Interior, Riaz Pasha; Minister of War and Marine, Omar Pasha

Lutfi; Minister of Public Works, Ali Mubarek Pasha; Minister of Finance, Haidar Pasha; Minister of Public Instruction, Khairz Pasha; Minister of Justice, Fakhri Pasha; Minister of Vakufa, Zeki Pasha; Minister for the Soudan, Ismail Ayub Pasha.

Lord Dufferin, special commissioner of the British Government, after working out a comprehensive scheme of legislative, judicial, and administrative reform, returned to his post in Constantinople in the beginning of May, 1888. After the abolition of the dual control by a khedivial decree, Sir Auckland Colvin was appointed financial adviser to the Khedive. A Council of State, composed partly of natives and partly of Europeans, was created in September. In the same month Sir Edward Malet was succeeded by Sir Evelyn Baring in the post of British diplomatic agent and consul-general. Sir Auckland Colvin was replaced by E. Vincent as European financial adviser to the Khedive. Clifford Lloyd was at the same time appointed adviser to the Minister of the Interior. On Nov. 22d, M. Camille Barrère presented his credentials as French diplomatic agent and consul-general.

After the destruction of the Soudan army, the Egyptian Government, unable to agree to the British proposition to evacuate a part of the Soudan and cede territory on the Red sea to Abyssinia, gave in their resignations. A new Cabinet was constituted by Nubar Pasha.

Area and Population.—The area of Egypt proper is about 210,000 square miles. The population in 1877 was stated in an official estimate to be 5,517,627, of which number 569,115 resided in the Mohafzas, or town districts, having an aggregate area of 176,546 square kilometres, and 4,948,512 in the Moudiriehs, or provincial districts, 844,808 square kilometres in extent. The number of births registered in 1877 was 178,529; of deaths, 188,668. The net immigration from 1873 to 1877 was 19,241. The number of foreigners residing in Egypt in 1878 was returned as 68,658, of whom 29,968 were Greeks, 14,524 Italians, 14,310 French, 3,795 English, and 6,061 of other nationalities.

An enumeration conducted in 1888 gives the total native population of Egypt proper as 6,798,280, of whom 3,893,918 were males and 8,404,312 females.

The population of the principal towns in 1883 was as follows: Cairo, 368,108; Alexandria, 208,775; Tanta, 88,725; Damietta, 84,086; Mansura, 26,784; Zagazig, 19,046; Rosetta, 16,671; Port Said, 16,560; Suez, 10,918.

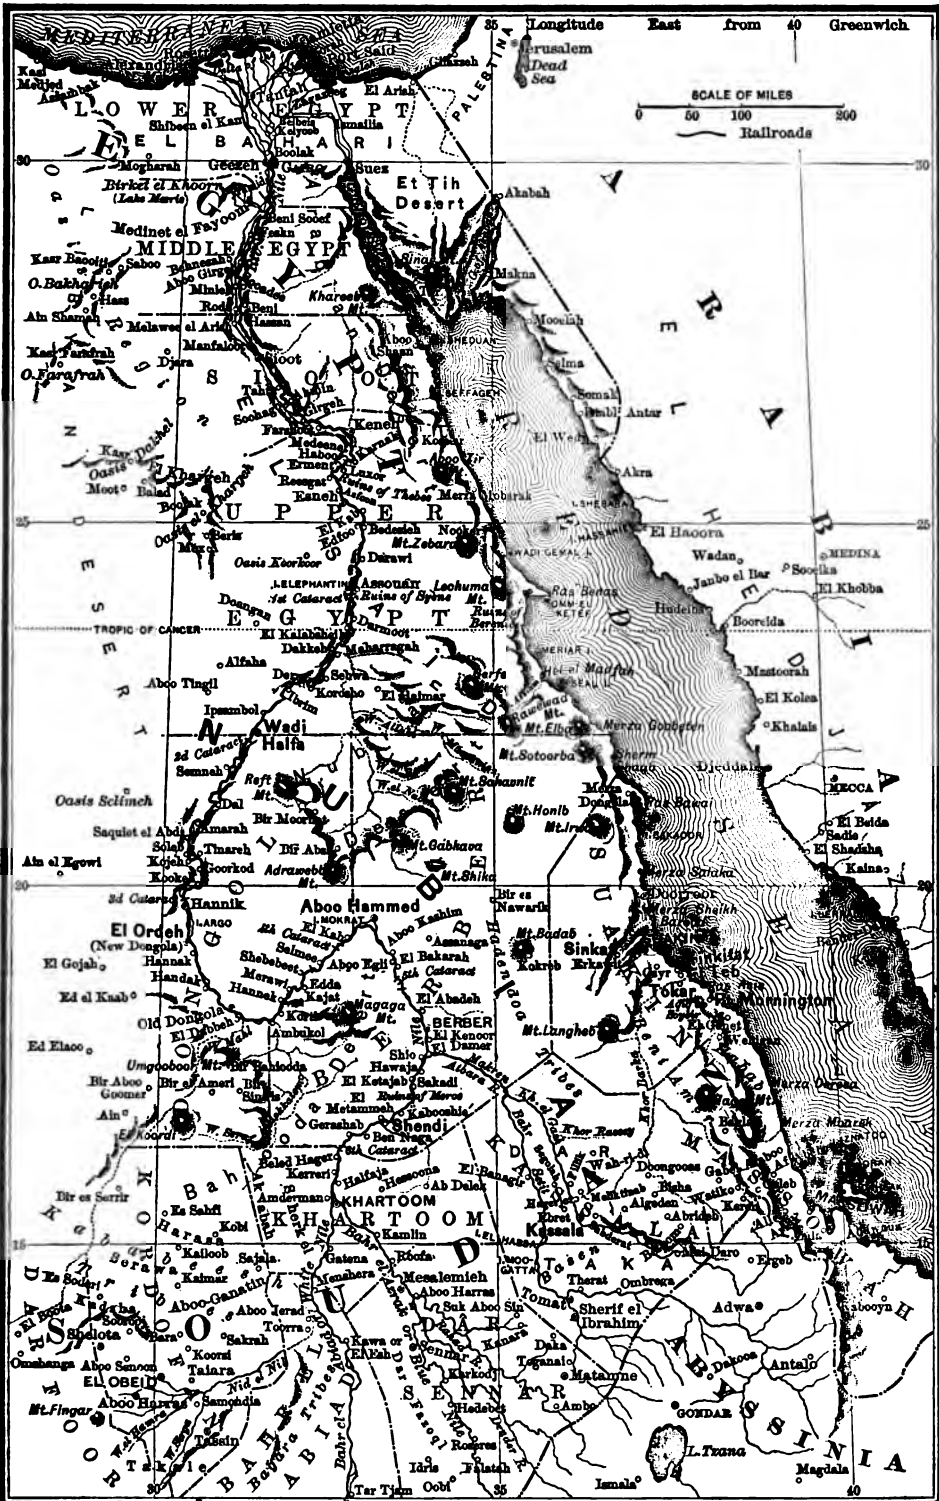

The population of the three geographical districts into which Egypt proper has from ancient times been divided was as follows in 1877, not including the population of the town districts, amounting to 569,115: Lower Egypt, 2,828,995; Middle Egypt, 658,119; Upper Egypt, 1,471,398. The whole country is divided into eleven administrative provinces.

The Soudan.—The conquered and annexed

districts on the Upper Nile and in Central Africa are known collectively as the Egyptian Soudan. They form a single administrative district, and since Arabi's revolt have been placed in charge of a special ministry. The Soudan proper is divided from Egypt by a belt of desert, and is not easily accessible by water on account of the deposits and growths which frequently obstruct the Nile. The inhabitants of the Upper Nile region are distinct in race from the Egyptians. The conquest of this region was begun by Mehemet Ali, who annexed Sennaar and Kordofan. The same policy was pursued by his successors, especially Ismail Pasha, who, urged on by Europeans who wished to obtain commercial profits from this country, or were interested in the suppression of the slave-trade, or the exploration of the sources of the Nile, added the province of Darfour to his dominions in 1869, and subsequently the equatorial province, extending to the border of King Mtesa's empire of Uganda. The annexation of Darfour was only nominal as long as the power of Sebehr* remained unbroken. Suleiman, Sebehr's son, who rebelled openly in 1878 after his father's arrest, was finally overthrown by Yussuf Pasha and Romolo Gessi, Gen. Gordon's Italian assistant. "Chinese" Gordon, who was clothed with unlimited discretionary power, was more successful than his predecessor, Sir Samuel Baker, in maintaining the authority of the Khedive. But the Arab colonies of Darfour and the desert, and the warlike negro races of the rest of the Soudan, profoundly dissatisfied with the extortionate and corrupt rule of the effeminate Egyptians, were ready to oppose a desperate resistance to the proposed abolition of slavery. Gordon's pacification of Darfour and the Nile country was only superficial, and, notwithstanding the ascendancy and popularity which he acquired among a large part of the population, he left more dangerous elements of discontent than existed before his coming. The inhabitants of Bahr Gazelle and Gondokoro are more nearly akin to the Egyptians, and have always proved more tractable than the black races of the Soudan.

The whole of Upper Egypt, comprising Kordofan, Sennaar, Darfour, Berber, Suakim, Shendy, Bahr Gazelle, and all the region between Wady Halfa and Abyssinia and Uganda, from the Red sea to the Libyan desert, was united in 1877 into one administrative district under the name of the Soudan. This country is surrounded on three sides by deserts. Its length is 1,640 miles, and its average breadth 660 miles. The population is about 40,000,000, of which number 10,000,000 are not under the

* Sebehr was a slave-dealer who resisted the anti-slavery designs of Ismail and the British officers placed by him in command in the Soudan. The khedive formed an alliance with Sebehr, who had established a formidable military power, for the conquest of the independent sultan of Darfour. Sebehr went to Cairo with the expectation of bribing the pashas to get his sovereignty recognized, but he was arrested and kept in retirement at Cairo until his services were employed in 1858 against the Mahdi.

control of Egyptian officials, and are only nominally subject to the Khedive.

The desert regions are inhabited by Arab tribes, whose chief occupation is breeding camels. The Haddendowas, who inhabit the mountains of the coast, speak a peculiar language which is not Arabic. The Bishareens live in the Nubian desert. Various other tribes occupy the Blue Nile and Atbara regions. The camel is the only means of transportation across the Nubian desert between Egypt proper and the Soudan. The inhabitants of Sennaar are a peculiar race, but several other tribes, each governed by its sheik, subject to the authority of the mudir of the district, inhabit the region between the Blue and White Niles.

The revenue of the Soudan is collected by the aid of troops through the mudirs and sheiks, who extort more than double the legal taxes. There are numerous indirect taxes, besides the poll-tax, and a direct tax on every head of live-stock.

Slavery is universal throughout the Soudan. About seven eighths of the population are slaves. Their lot is not severe, and the force of custom is generally stronger than the desire for emancipation. The soldiers of the Egyptian army with which the rule in the Soudan is maintained, and the black troops stationed in Lower Egypt, are liberated slaves. The army of Sebehr was composed, and that of the Mahdi is now made up, in great part, of the same material.

The products of the Soudan are various, and some of them are valuable articles of commerce. The Arabs of the desert grow sheep and goats as well as camels. The mountains between Suakim and Berber are covered in many places with senna. The chief supply of gum-arabic comes from Kordofan and the regions between the Atbara and Settite rivers, where it is produced in the finest quality by the thorny mimosas which grow in thickets. Along the upper course of the Atbara, south of Cassala, and in the country between there and the Blue Nile, the dhurra-corn is so prolific that a camel's load (500 pounds) costs less than a dollar. Sesame, from which oil is extracted, a kind of millet called dochan, and cotton are the other cultivated products. This region, from Cassala through the ancient Meroe, Sennaar, and on the borders of all the affluents of the Nile, is capable of producing sugar, spices, and all kinds of tropical plants, and is peculiarly adapted to the cultivation of cotton, as the rain falls profusely from May to September, after which there is neither rain nor dew. Wheat is grown south of Khartoum. Ivory and India-rubber are brought from the Central African provinces on the White Nile. Feathers come from the distant equatorial regions. The feather, ivory, and senna trades are particularly affected by the interference with the slave-trade.

Finances.—The total receipts for 1880, when

the first budget of the International Commission of Liquidation was adopted, were 8,561,622 Egyptian pounds (the Egyptian pound is approximately equivalent to \$5), and the total expenditures 7,911,622 pounds. The budget for 1881 estimated the revenue at 8,419,421 pounds, and the expenditure at 8,308,870 pounds. The actual receipts were 9,222,965 pounds, and the expenditures 8,377,423 pounds, leaving a surplus of 852,542 pounds. The budget for 1882 estimated the revenues affected to the public debt as 4,377,225 Egyptian pounds, and the expenditures as 4,097,100 pounds, leaving a surplus of 280,125 applicable to the sinking fund. The service of the privileged debt required 1,159,212 pounds, the unified debt, 2,223,927; total debt charge, 3,383,139 pounds. The budget of non-affected revenues placed the receipts available for the administration of the Government at 4,336,223 Egyptian pounds, and the expenditures at 4,366,868 pounds. A supplementary budget provides for the employment of the expected surplus over the estimates, amounting to 540,000 pounds.

The provisional estimates for 1883 calculated the total receipts at 9,012,010 Egyptian pounds, and the total expenditures at 7,677,806 Egyptian pounds. The ordinary budget for that year states the receipts as 8,419,421 Egyptian pounds, and the expenditures as 8,308,870 Egyptian pounds. The estimated yield of the main sources of revenue in 1883 was, in pounds sterling, as follows:

SOURCES OF REVENUE.	Amount.
Land-tax, and other direct taxes.....	£2,867,694
Indirect taxes (comprising customs, post, and octroi receipts).....	1,854,294
Railroads and telegraphs.....	1,198,545
Miscellaneous receipts.....	839,164
Total revenue of 1883.....	£6,800,697

The amounts required in 1883 to meet the foreign obligations and the estimated requirements of the Government were as follow, in pounds sterling:

EXPENDITURES.	Amount.
Turkish tribute.....	£278,897
Public debt.....	3,748,164
Administration of the government.....	4,155,857
Total expenditure of 1883.....	£8,182,918

The result of the first year of British protection and control was to embarrass the finances to an extent unknown in the worst years of misfortune and mismanagement. To a deficit of £191,000 in 1882, was added one of £250,000 in 1883, which, with an additional Soudan expenditure of probably £500,000, the cost of the army of occupation amounting to £600,000, the Domains and Daira deficits of £400,000, and the indemnities awarded for destruction of property in Alexandria and elsewhere, created a floating debt of nearly £6,000,000. A new loan to cover this would have to be added to the crushing public debt, which was the main cause of Egyptian troubles, before the first step could be taken to carry out the expensive reconstructive reforms which were promised by the English.

The state of the public debt on Jan. 1, 1882, is shown in the following statement of the amounts of the different classes of loans, in pounds sterling:

CLASSES OF DEBT.	Amount.
Unified debt, at 4 per cent.....	£27,023,730
Privileged debt, at 5 per cent.....	22,529,800
Domain loan, at 5 per cent.....	8,362,250
Daira-Sanieh debt, at 4 and 5 per cent.....	9,245,860
Total foreign debt.....	£67,161,640

The Monkabalah debt, a forced loan imposed upon the peasantry and scaled down by the Liquidation Commission, constitutes another obligation of the Government. The reduced capital and interest is to be paid in annuities of 150,000 Egyptian pounds, and extinguished in fifty years. The interest on the Suez-canal shares purchased by the English Government of the Khedive Ismail in 1875, is an additional charge of £200,000 sterling per annum.

(An account of the Suez canal, and the controversy relating to its improvement, is given under the title **SUEZ CANAL.**)

Commerce.—The total exports of Egypt increased in value from 275,000,000 piastres in 1855 (1 piastre = 5 cents) and 506,000,000 in 1862, to 1,028,000,000 in 1870, 1,838,000,000 in 1875, 1,356,000,000 in 1876, 1,275,000,000 in 1877, 810,000,000 in 1878, 1,344,000,000 in 1879, and 1,298,000,000 in 1880.

The export and import commerce with the countries having the largest trade with Egypt was in 1881 of the following values, in piastres:

COUNTRIES.	Exports.	Imports.
Great Britain.....	822,459,000	861,740,000
France.....	115,456,000	118,945,000
Austria-Hungary.....	46,584,000	91,946,000
Italy.....	78,308,000	22,155,000
Turkey.....	40,493,000	15,429,000
Russia.....	163,641,000	18,823,000
America.....	4,944,000	14,495,000
Greece.....	10,105,000	1,778,000
Other countries.....	15,164,000	46,814,000
Total commerce.....	1,298,250,000	698,745,000

The values exported of the leading articles of export in 1881 were, in piastres, as follow:

EXPORTS.	Value.
Textile materials.....	894,175,000
Cotton-seed.....	150,659,000
Cereals.....	142,269,000
Sugar.....	80,370,000
Gums, fats, and oils.....	26,308,000
Hides and skins.....	13,867,000
Ostrich-feathers.....	6,549,000
Other commodities.....	83,459,000
Total exports.....	1,298,251,000

The principal imports were textile fabrics, coal, metal manufactures, machinery, and other manufactured products. The total tonnage entered at Egyptian ports in 1880 was 3,242,022 tons; cleared, 3,255,614 tons. Of the 8,882 vessels entered, 3,657, of 294,183 tons, carried the Egyptian flag, including 257 steamers, of 177,011 tons.

Communications.—The length of railroad lines in operation in 1883 was 1,518 kilometres.

The length of telegraph lines in operation in 1878 was 7,841 kilometres; of wires, 12,040 kilometres. Of the total length of lines 3,943 kilometres were in the Soudan.

Diplomatic Discussions.—The year opened in the midst of a controversy between the British and French Governments over the abolition of the dual control and the termination of the Anglo-French condominium. Great Britain sought to soften the disappointment of France and render less abrupt the transition to British sole supremacy by instituting a Public Debt Commission to replace the Control as the agency for the protection of the bondholders' interests. The presidency of the proposed board was offered to France. M. Duclerc rejected the proffered compensation, as the French were not disposed to resign voluntarily their prescriptive powers in Egypt or participate in changing the *status quo* to their own prejudice. In his note of January 4th, he demanded that France should receive, in case the control should be transformed, an equivalent position in the new arrangements. Here the negotiations terminated. Lord Granville then sent an identical note to all the powers, defining the English position and intentions.

The dual control came to an end by the withdrawal of two of the contracting powers from the financial arrangements on which it was based. The initiative came ostensibly from the Egyptian ministry. On January 11th Sir Auckland Colvin, the English Controller, tendered his resignation to the Khedive. The proposition of the Egyptian ministry to abolish the Control had been received two months before. Sherif Pasha, in his note dated Nov. 7, 1882, based his objections to the institution chiefly on the fact that it had taken on "almost a political character," encroaching in dangerous proportions on the authority of the Government of the country, while it is not intended to form a guarantee to the bondholders, who already possess special guarantees. On January 25th Earl Granville sent an answer to M. Duclerc's note, in which he proved that the Anglo-French Control was not based upon international agreements, but upon a simple ordinance of the Khedive Ismail, and that its re-establishment in 1879 by mutual agreement of the three powers revived only its former qualities, and did not constitute an international engagement, revocable only with the consent of England and France. Lord Granville's circular premised the unwillingness of other powers to join in the suppression of the military rebellion, which threw the task upon England alone. It announced the intention of withdrawing the British army of occupation as soon as order should be established. In the mean time it would be necessary to impart advice to the Khedive regarding internal and foreign affairs for the purpose of securing a new order which should be permanent and satisfactory. With regard to those matters which are affected by international rights and

agreements, it proposed, first, new regulations to secure the future neutrality and inviolability of the Suez canal.* Its occupation by the British and use as a base of operations against Arabi was asserted to have been no violation of the neutrality of the canal, being intended to vindicate the authority of the Khedive. For the future it was proposed that the canal should be free to all ships at all times; that in time of war naval vessels of a belligerent power should not be allowed to remain in the canal longer than a certain limited time, and that no troops or munitions of war should be debarked; that no hostilities should be permitted in the canal or its approaches, or within the territorial waters of Egypt, even though Turkey should be one of the belligerents. These restrictions, however, are not applicable to measures necessary for the defense of Egypt. It is further provided that each power shall repair any damage committed by its belligerent vessels in the canal. No fortifications are to be constructed on the canal or its approaches. The enforcement of the regulations is made incumbent upon Egypt. The proposals for a new system of financial control were declared to be not yet matured. The consent of the powers was asked to an alteration of the capitulations which would allow the Egyptian Government to tax foreign residents equally with natives; also to the prolongation of the mixed tribunals for one year only, in the hope that an amendment of the Egyptian code and procedure would then warrant their abolition.† With regard to internal matters which had not been made the subject of international agreement, the British Government announced the organization of a force of gendarmerie and police, distinct from the army, for the preservation of domestic order; and that the army, which should be kept small, would, at the request of the Khedive, be officered in the higher posts in part by English soldiers. On the question of the development of political institutions, the British Government indicated the intention of establishing representative government with prudent checks, in some form adapted to the present political intelligence of the people, and calculated to aid in their future progress.

While the other European governments acquiesced in the position of Great Britain in Egypt, and at times assumed a tone which seemed to favor the establishment of a permanent protectorate, France preserved an attitude of protest and expectancy. When the controversy with M. de Lesseps came up, regarding the construction of a second Suez canal, the French Cabinet manifested a determination not to allow the rights secured to the French company by concessions to be annulled. The Turkish Government also manifested a

jealous anxiety for the sovereign rights of the Sultan in Egypt. After the disaster to the army of Gen. Hicks in the Soudan, and the indication on the part of the English Government of a desire to abandon the Soudan, suggestions were made of an intervention by France, while the Porte made an express proposition to send a Turkish force to the Soudan to quell the rebellion.

The Army of Occupation.—The British Government gave reiterated assurances during the earlier part of the year that the British forces would be withdrawn as soon as the Khedive's Government was reorganized on a basis insuring internal peace and stability. They evinced the sincerity of their declarations by recalling the troops, which numbered about 12,000 in the beginning of 1888, until in September only 6,750 remained, and continuing the reduction until in November the garrisons numbered only about 3,000. In the summer, Lieut.-Gen. Stephenson succeeded Sir Archibald Alison in the command of the army of occupation. There were manifestations of anti-European feeling, which increased in frequency and bitterness, and the Egyptian demands for the evacuation became more general and urgent. In addition to the other objections to the continued occupation, was that of the financial burden it imposed on the Egyptian people. The British Government required the country to pay £4 a month for every soldier, which was represented to be the difference in the cost of maintaining them there and in Great Britain. When the news of the destruction of Hicks Pasha's Soudan army arrived, the preparations for the further withdrawal of the British troops were suspended.

Financial Adviser.—Sir Auckland Colvin, previously British Controller, was appointed Financial Counselor to the Khedive, by a decree promulgated February 6th. This office, destined to take the place of the dual control, was defined by Sherif Pasha, the Prime Minister, in a report accompanying the decree, to have none of the political attributes of the control. The Financial Counselor, without being a minister, should sit at Cabinet meetings when invited to do so, and should have the power to examine financial questions, and to give advice within the limits prescribed by the Khedive and his ministers, but would have no authority to interfere in the administrative affairs of the country.

British Project of Parliamentary Government.—Lord Dufferin's scheme of representative government was announced about the middle of January. This plan, formulated by the Egyptian Government under the advice of the British plenipotentiary, proposed to place the chief power as before in the hands of the ministry. The Khedive should have a council of twelve responsible ministers, possessing the powers previously exercised by the Egyptian ministry, except that their acts must be approved by a Legislative Council, consisting of

* Great Britain commands both entrances to the canal from the near stations of Malta and Aden.

† The system of mixed tribunals was instituted in 1876 for the period of five years. The two previous prolongations were, like this one, from year to year.

fourteen members, half of them nominated by the Khedive, and half of them elected by a college of electors chosen by the people. A second and more popular elective assembly, consisting of forty-four members, was to be convened occasionally to discuss special subjects, without possessing any direct voice in legislation. In case the Legislative Council should reject a measure of the ministry, the final decision would rest with the Khedive.

This scheme was afterward modified so as to give the representative principle fuller scope. From the chief legislative body, called the General Assembly, the eight ministers of the Cabinet are to be selected, who shall be responsible to the Khedive.

The General Assembly consists of 84 members, composed of the 8 ministers, the 80 members of the Legislative Council, and 46 additional members chosen by the spokesmen or electors of the towns and villages.

The Legislative Council consists of 80 members, of whom 14 are appointed by the 14 Provincial Councils, an equal number are nominated by the Khedive on the advice of his ministers, and the remaining two represent one the city of Cairo, and the other Alexandria, Damietta, Port Said, Rosetta, Suez, El Arish, and Ismailia collectively. The Khedive selects from among his appointees the president and the first vice-president.

The Provincial Councils are elected indirectly in each of the fourteen provincial districts by universal manhood suffrage. Every Egyptian twenty years of age, not in military service, who has never been convicted of crime and is not adjudged insolvent, has the right to vote for electors who choose the representatives in the different elective bodies. There are about 908,420 voters altogether, of which number 797,571 are in the villages, and 105,849 in the towns. Each village constituency, of which there are about 4,800 altogether, elects one representative in the college of electors, which convenes by order of the Khedive in the chief town of each of the 14 provinces and elects the Provincial Councilors. There are 70 Provincial Councilors elected in the 14 constituencies. The number of electors in the different provinces varies from 90 to 544, the average being 307.

The election of the electoral colleges for the Provincial Councils, Legislative Council, and General Assembly took place in the latter part of September. Yet because they feared the temper of the Egyptian people, which grew more and more hostile and morose, or for other reasons, the British advisers of the Khedive deferred indefinitely the putting into operation of the legislative and representative institutions they had devised. As a temporary substitute, the Khedive appointed a Council of State, consisting of eleven Egyptians, two Armenians, and ten Europeans. Sherif Pasha was appointed president. The European members were E. Vincent, Lemesurier, and Rowsell,

Englishmen; Gay-Lussac, Pietri, Rousseau, and Borelli, Frenchmen; Blum and Keller, Austrians; and Ara, an Italian.

Reorganization of the Army.—Soon after the occupation, the Khedive, of his own motion, summoned Baker Pasha, a British officer in the service of the Sultan, to Cairo, and intrusted him with the task of organizing a new military force. He was appointed commander-in-chief, had the rank of Ferik, the highest in the Egyptian army, bestowed upon him, and worked out a scheme for an army of about 6,000. He was not, however, the choice of the British Government, and was superseded by Sir Evelyn Wood, who adopted the main features of the plan. Gen. Baker was then commissioned to organize a constabulary force separate from the army.

The new army was to be raised by enlistment. Compulsion in recruiting was prohibited, non-commissioned officers were forbidden to strike the soldiers, and the new force was recruited in a short time. Under Sir Evelyn Wood as chief in command, the cavalry was commanded by Lieut.-Col. Taylor, the artillery by Lieut.-Col. Duncan, and one of the infantry brigades by Brig.-Gen. Grenfell, all of the British army, the command of the other brigade of infantry being given to Ali Pasha Tchudi, an Egyptian general. The infantry were armed with Remington rifles, and Krupp guns were provided for the artillery. The troops and all officers below the rank of captain were to be native Egyptians. One half of the regiments were to be commanded by Egyptians, while the others were to have an English lieutenant-colonel and major for chief officers, the total number of British officers being limited to twenty-five.

Instead of the cruel treatment and seclusion resembling the punishment of a felon, which followed forced conscription in the old Egyptian army, and instead of an indefinite term which often lasted to old age, the discipline and treatment were assimilated as far as could be to the system of the British army. The pay of a piastre a day is given regularly every month. The term of service is four years with the colors, and four in the reserve. An annual leave of absence and a daily release from duty for an hour or two are allowed. The hospital and commissary administration are excellent, and schools and other modern improvements have been introduced.

Gendarmerie.—Baker Pasha organized a force of 4,000 gendarmes, divided into two battalions, one of rural and one of city gendarmerie. The commanders and inspectors were all British army officers. The urban constabulary were intended to assist the police proper in preserving order in the larger towns of the Delta. The ordinary police in these places numbers 1,600. The object of both the army and the constabulary was to keep the population in check by disciplined armed forces under the control of Europeans, and thus prevent

or promptly suppress any riotous or insurrectionary outbreak. The separation of the military force into two distinct establishments was expected to render it a more reliable instrument. The gendarmerie was intended to be a larger organization than the army, and to number altogether 7,890 men. They are mainly armed and equipped as mounted infantry.

Before the British plans were developed, and soon after the destruction of Arabi's army, the Khedive began to form a military police and body-guard from foreigners enlisted in Switzerland, Albania, Dalmatia, and Turkey. The Swiss and other Europeans were to constitute the military police of the cities, and the Turks, Bosnians, and Albanians the palace-guard and the gendarmerie. Baker Pasha was at first intrusted with the organization of the latter bodies; but finally, through the influence of the British agents, especially after the European police proved unruly and disorderly themselves, the scheme was abandoned in favor of the one described above, and finally developed by Gen. Wood.

The military character which Baker Pasha impressed upon the gendarmerie was objected to in England, and the Egyptian authorities were influenced to alter the character of the organization, depriving the officers of their military titles and honors, changing the official designation of the corps to the English word "constabulary," etc. Yet, when the army of the Soudan was annihilated, this was the only force available for the relief of the Soudan towns and garrisons, except what blacks the former rebel, Sebehr, was able to enlist in the Delta. The reason of sending gendarmes to the Soudan and leaving the soldiers to do police duty in their place, was because the new army was enlisted on the express condition that they should not serve in the Soudan.

Establishment of Native Courts.—The organization of new native tribunals was proceeded with early in the year. They are to be presided over partly by native and partly by European judges. The latter are the exception, and will eventually give place to Egyptians. A simple code of procedure was drawn up by an English and an Italian jurist, Messrs. Hills and Moriondo. The parties appear before the Judge of Instruction, a native, who acts as a Conciliation Court, and decides whether there is a case for litigation. He lays both sides of the case before the Court of First Instance, of which there are eight altogether. The forms of French law, simplified, were adopted because the Egyptians are familiar with no other law, except the Sheriat law administered by their cadis, and because it was the intention to merge, in the course of time, the international tribunals in the new indigenous tribunals, and therefore desirable to retain the forms of the Code Napoléon, which govern the procedure of the mixed courts. Since English judges were not fitted to apply a strange code of procedure, and on the ground of economy,

the European members of the new courts were brought from Belgium and Holland.

Financial Problems.—The financial difficulties which compelled the abdication of Ismail Pasha, and underlay the revolt of Arabi, confronted the English in as formidable a shape as ever. No improvements in the system of government, in the administration of justice, or in any of the departments of the public service, would be of any use unless means could be devised to enable the fellahen to bear their financial burdens and to stay the progressive impoverishment of the country. After a year of war and anarchy, followed by a pestilence, the people were called upon to meet extraordinary demands for the cost of occupation, indemnities, etc., while under British direction the expenses of administration increased.

Since it was out of the question, under the circumstances connected with the intervention of Great Britain, to require the bondholders to forego their claim to half the total revenue of the country, the only relief was through reforms and public improvements, which would only yield their results after several years. The Egyptians, filled with national and religious animosity against the British, were not conciliated by the promised reforms, the immediate object of which seemed to be to supplant foreign speculators of other nationalities by English speculators, and supersede the officials introduced by the dual control with still more expensive English officials.

The impoverishment of the country was manifested by the neglect of the irrigation-works and the relapse of cultivated areas into barrenness, and by the increasing indebtedness and more frequent bankruptcy of the fellahen. The private indebtedness of the peasantry was estimated by some as high as £15,000,000. Lord Dufferin placed it at £9,000,000. At the time of the abdication of Ismail the aggregate amount did not exceed £1,400,000. The average interest paid on unsecured debts was not less than 36 per cent. per annum. A frequent arrangement was to pay three-month loans of napoleons in pounds sterling, equal to 100 per cent. per annum! The average product of the land is about £3½ per *feddan* (nearly an acre), instead of £15 to £30, as estimated by Villiers Stuart. The taxes average 40 per cent. of the annual product. The rapid increase of insolvency was due to the right of foreclosure given to creditors by the mixed tribunals, a remedy which is foreign to the customs of the country. The quantity of land which actually passed into the hands of Europeans under judicial sales was stated in the later inquiries to be only a few thousand acres. More than half of the loans were also said to have been made by banks doing a legitimate business, and not receiving over 10 per cent. interest on mortgages.

The principal present remedy proposed by Lord Dufferin for the relief of the economic distress was to rescue the fellahen from the

toils of the usurers. The usual course of foreign creditors when the fellahen were not prompt in their payments had been to appeal to the provincial governor or his subordinates, who would compel payment, if the fellah was able, by arbitrary methods. The provincial authorities were admonished by the Minister of the Interior in the summer not to interfere in the disputes between the fellahen and their creditors, who must have recourse to the courts of justice. An appeal was made to the creditors to deal leniently with the fellahen until normal conditions return. It was expected that English capital would flow into the country, and not only provide the fellahen cheap money for their present wants, but enable the Government through the co-operation of an English commission to assume the debts of the fellahen and convert the usurious interest into moderate rates. It was further announced that the commission intrusted with the revision of the Egyptian laws would incorporate in the new code a provision reserving a certain quantity of land to every farmer as an inviolable and inalienable family possession. The first effect of these proposed reforms was to aggravate the financial embarrassments of the peasantry, for now the money-lenders would make no more loans. The fellahen on their part refused to pay their debts until the English commission met to consider them. After several months of this monetary derangement, the Ministry of the Interior in November issued another order directing the provincial authorities to take measures to induce the fellahen to pay their foreign creditors. The commission to consider the indebtedness of the fellahen was appointed in October. After a few sittings the Government changed its attitude in this question and adjourned the inquiry until the next year.

The partition and sale to the fellahen of the Daira Sanieh and Domain lands is expected to improve the well-being and the tax-paying capacity of the people. These estates, to consolidate which vast numbers of fellahen were expropriated by the ex-Khedive, cover a fifth part of the total cultivable soil of Egypt. Their administration by European officials has not been successful. Under the Control the Daira Sanieh thus administered paid expenses and the interest on the debt for which it was pledged, while the Domains ran behind £700,000 in four years. The latter were partly divided up into parcels in 1883 and conveyed to peasant owners.

The decay of agriculture can not be effectually arrested without taking measures for the restoration, improvement, and maintenance of the irrigation-works. The *corvée* is no longer equal to the task of keeping the canals clear, and the desert is encroaching upon the tillable land. The introduction of steam-engines for pumping supplied a corrupt motive for negligence, since the failure of the subsidiary canals enables the proprietors of steam-

pumps to exact a high price for furnishing the peasants with water. Extensive improvements in the system of canalization were among the promises held out by the English, and technical studies of the subject were undertaken.

Repeal of the Capitulations.—The English were hindered at every point in their reform projects by the capitulations, which grant exceptional rights and immunities to foreigners, the chief of which are exemption from taxation, and separate courts of justice. These privileges constituted in some respects a serious grievance. The English had a double motive in desiring to abolish them—to win popularity with the Egyptians, and to take away from other foreign countries their exceptional position and right to interfere in Egypt. The abrogation of the capitulations was opposed by the foreign colonies in Egypt, to whom those privileges were materially valuable. Still, the European governments were willing to accede to the proposition, with the exception of France. That power refused its consent, and so the year passed by without this necessary preliminary to financial reform and the contentment of the Egyptians being accomplished.

Alexandria Indemnity Commission.—A commission was appointed in the spring, charged with investigating and deciding upon claims for indemnification for damages suffered from the bombardment, burning, and pillage of Alexandria. The president was Abdurrahman Rushdi, and the vice-president Yacoub Artin Beys; the other members were representatives of England, Austria, France, Germany, Italy, Russia, Greece, and the United States. Claims less in amount than £200 were first taken into consideration. The majority of these were presented by native Egyptians, the Greeks and French coming next. The commission had not quite ended their labors at the close of the year. The total amount of damages awarded approximates £4,000,000.

Political Trials.—Several trials for crimes connected with the Alexandria riots, the burning of that city, and other incidents of the rebellion, were set on foot by the Khedive's Government; but after it was seen that the object was to strike terror, and that dangerous revelations might be brought out in evidence, the English discouraged these prosecutions. The first trial was instituted for the satisfaction of the English themselves. The accused were thirteen Arabs indicted for the murder of Prof. Edward Henry Palmer and his companions, Capt. William Gill and Lieut. Harold Charrington, on Aug. 12, 1882. That well-known Oriental scholar, who had recently visited several Arab sheiks and sought to win them over to the English cause, was commissioned to return and complete the arrangements in company with the two officers. The party carried with them for this purpose £40,000, ostensibly to be employed in buying camels for the British army. Capt. Gill had orders to cut the tele-

graph wires and prevent Arabi from holding telegraphic communication with the East. A sheik named Meter Sofieh accompanied them as guide and protector from Moses' Wells on Aug. 10th. Betrayed perhaps by him, they were captured by a troop of Bedouins and shot as spies. Of the thirteen persons brought to trial on Feb. 18, 1883, five were shown to have taken a subordinate part in the act, and were executed on Feb. 28th.

On the 7th of June Suleiman Daoud Sami, military commandant of Alexandria at the time of the bombardment, was brought before a court-martial on the charge of having ordered the plundering and burning of Alexandria. The British Government gave assurances that the rules of evidence and the right of defense would be observed, but the motive for the removal of Suleiman Sami and closing the delicate questions connected with that episode of the war was so strong that he was hastily put through an irregular trial, and executed on June 9th, just as the Foreign office in London were about to bestir themselves in the matter. In the beginning of July Said Bey Khandeel, prefect of police at Alexandria, was tried for conspiracy, on suspicion of having incited the massacres of Alexandria. The advocates of the accused offered to prove that the Khedive himself instigated Omar Lutfi, then Governor of Alexandria, to stir up the disturbances which culminated in the riot and massacres of June 11, 1882, with the object of discrediting Arabi Pasha who had guaranteed public safety. Said Khandeel was acquitted of the main charge, but condemned to seven years' hard labor for neglect of duty and connivance in the disorders. In September a number of the native police were executed for having taken part in the massacres. There were numerous other executions in different parts of the country.

In the first week of October, the jails were thrown open, and the multitude of prisoners incarcerated on charges connected with the mutiny and rebellion were set at liberty. The courts-martial and prosecution committees were dissolved, and on the 10th of October the Khedive granted amnesty to all concerned in acts of violence, pillage, and incendiarism during the disturbances, murder excepted.

The Cholera.—On June 26th the cholera appeared at Damietta, and, spreading through the Delta, raged until autumn. The European press charges the British authorities with having negligently allowed infected persons to import the disease from India. It is certain that no quarantine precautions were taken, and that the disease was of the genuine Oriental type. The English Government, in their anxiety to rebut this accusation, obtained a report of English experts declaring that cholera had been endemic at Damietta since 1865, while Egyptian officials published a statement that Asiatic cholera had never been endemic in Egypt.

The Soudan Rebellion.—The resistance of Se-

behr, who, with a large number of sheiks and chiefs, threw off the authority of the Khedive in 1878-'79, and successfully opposed the efforts of Sir Samuel Baker and Gen. Gordon to put down the slave-trade, prepared the Soudanese for the great uprising of a mingled religious and political character under Mohammed Achmed, the pretended Mahdi, or expected redeemer of Islam (see MAHDI, EL). The English war of occupation gave this leader the opportunity of consolidating his power, and enabled him to obtain the prestige of victory. The efforts of the English to root out slavery, and the approach of 1889, the year set for general emancipation, added new motives to the old desire for deliverance from the Egyptians.

The religious phase of the movement in the Soudan, though prominent in the beginning, gradually sank in importance as compared with the political side of the rebellion. The Mahdi himself, while proclaiming his divine mission to revive the power of the Shiite sect in the beginning of the thirteenth century of the Hegira, showed more of the characteristics of an ambitious ruler than of a religious leader. The Soudanese themselves were filled with a longing for deliverance from the harsh Egyptian yoke. They had not forgotten the cruelties of the conquest, sixty years before, when the Fung, the finest of the Ethiopian tribes, whose kingdom extended from Sennaar to the second cataract, succumbed after a valorous resistance to the Egyptian fire-arms, but, unable to furnish the boat-load of gold demanded by Ismail Pasha, son of Mehemet Ali, murdered the prince, and were in return butchered to a man by the relentless defterdar, except those who escaped into Abyssinia. The inferior fellabeen battalions have had to contend from that day to the present with these brave races, whose superiority in a military sense has been proved by the black regiments of the Khedive in every battle in which Egyptian troops have been engaged. The oppressions and extortions of the Egyptian officials, which culminated in the administration of Dhafar Pasha, Governor of Khartoum, in 1870, made the existence of the Soudanese a social martyrdom. The country-people dared not venture into Khartoum, for they were robbed by the soldiers and officials of the Khedive, and pressed into any labor that was required. Theft and robbery were never punished, and nothing was accomplished without bribery. Under Muntas Pasha, the next governor, who posed as a reformer, the impoverishment of the country was pursued with more system and thoroughness. The fields were no longer cultivated, because the harvest was confiscated. Pieces of land selected at will were declared khedivial property and cultivated with forced labor. The regulations of Baker Pasha for the suppression of the slave-traffic were circumvented, unless the officials, on the pretext of carrying them out, seized the slaves for their own use. To the Khedive's

Government this plundered land was a financial burden, the revenues not being sufficient to cover the expenditures.

In the summer of 1881 Reouf Pasha, then Governor of the Soudan, first heard of the religious pretensions and proclamations of the Mahdi, who at that time had but a small band of military followers about him on the island which he occupied in the White Nile. The governor sent an official to summon him to Khartoum. He refused, and, when a small force was sent by water to effect his capture, it met with a severe repulse. The Mahdi then withdrew for greater safety to Gebel Gedir, where he extended his influence for some time unmolested, and his adherents greatly increased in numbers. Finally, an expedition was sent against him in December, 1881, by Rashid Bey, Governor of Fashoda. This force was defeated.

The bravery of this officer and his 270 Nubian soldiers delivered the beleaguered garrison and townspeople, who from the fortified barracks kept the rebels thus long beyond gunshot. The rebel force swelled after the taking of Sennaar by Amr to at least 40,000. Sala Aga marched his little band into the midst of the insurgents, who mistook them for a body of rebels. Forming a square with their backs to the river, they opened fire. The rebels threw themselves upon the black soldiers, but with their savage weapons were unable to get near them. They returned to the attack and were driven back by withering fusillades all day long. After thousands had fallen and Sheik Amr himself was wounded, the rebels retired from the city.

Giegler collected a body of irregulars and marched on May 15, 1882, toward Abu Harras, where another rebel chief, the sherif Mo-

KHARTOUM, CAPITAL OF THE SOUDAN.

In the beginning of 1882 the new Governor-General of the Soudan, Abd-el-Kader, fitted out an expedition under the advice of Giegler Pasha, the Austrian vice-governor, with the intention of effectually suppressing the Mahdi. The command was given to Yussuf Pasha, the general who commanded the expedition that defeated Sebehr, the merit of which exploit was ascribed at the time to Gessi. The force which proceeded from Khartoum and Kordofan against the Mahdi consisted of thirteen companies of regular troops, 1,500 irregulars, and a number of loyal Arab sheiks with their people. The troops were excellently armed and provided with an abundant commissariat, and steamboats and camels for transport. They set out in the middle of March, 1882.

After their departure the news came that the sheik Amr-el-Makasef had risen in Sennaar, on the Blue Nile, and with thousands of rebels threatened the city of Sennaar. The Mudir of Sennaar received orders to attack Amr. The garrison were driven back into the barracks by the rebels, who sacked the town and massacred the inhabitants. The expedition against the Mahdi had stripped Khartoum of soldiers and munitions. Salah Aga-el-Mek, who with a battalion of infantry had been accidentally left behind by Yussuf's army, was commanded to march to the relief of Sennaar.

hammed Taha, who called himself the vizier of the Mahdi, was inflaming the whole district. An officer sent by the vice-governor with a detachment to parley with the rebels, attacked them, and his force was annihilated. Giegler Pasha awaited in Abu Harras the arrival of Ali Kashef, the newly appointed Mudir of Sennaar, with a sufficient force to clear the province of rebels. As Mohammed Taha had to be subdued before marching against the sheik Amr-el-Makasef, the vice-governor sent several hundred irregulars with a cannon against him. This detachment was also cut to pieces. The situation of Giegler Pasha was critical when Ali Kashef arrived with irregular troops and the chief of the Shukurieh with 2,500 warriors of his tribe. The next morning the whole force marched upon the village where the sherif was encamped, on the right bank of the Blue Nile. The leader of the insurgents came out to meet them, surrounded by hundreds of praying dervishes, and followed by his warriors and all the women and children. The fanatics allowed themselves to be decimated without faltering, until the sherif, whose seemingly charmed life inspired the soldiers with superstitious fear, was at last struck by a bullet; then they scattered, pursued by the savage soldiery, who spared none. Other uprisings were in progress; but they subsided after this blow, only

one body, under a certain Essein, making a stand against the Egyptian force. When these insurgents were cleared out of the way, the Egyptians advanced to meet Ahmed-el-Makasef, who had a force of about 10,000 men. They routed this army near the village of Teko, and thus put an end to the insurrection in Sennaar; but the sheik escaped with many of his followers, and joined the Mahdi in Kordofan.

These successes held the insurrectionary movement in check on the Blue Nile while Yussuf Pasha, with almost the entire force which Arabi's rebellion left in the Soudan, advanced against the Mahdi on the White Nile. In June he approached the rebel leader's stronghold in Kordofan. With superior strategic skill, the False Prophet selected an advantageous position and fell upon the advancing column by surprise at Gebel Geon, giving them no time to form in order of battle in a difficult position. The Egyptian army, though armed with muskets against swords and spears, was cut to pieces. Few of the soldiers and none of the officers escaped alive.

The Mahdi then directed his efforts with energy to taking possession of the Soudan, now almost stripped of its defensive force. But the fortifications of the towns were a formidable obstacle to his savage warriors. The slightest earthworks could be easily defended. At El Obeid the Mahdi met with his first reverse. In a single assault on September 8th, 6,000 rebels fell. Attempts to storm other places were unsuccessful. The Mahdi withdrew his forces on December 8th, and spent some weeks in improving their discipline and organization. He then returned and laid siege to El Obeid. The garrison held out until reduced to the last extremities. On the 15th of January they surrendered. Iskander Bey, the commandant, and the larger part of the garrison, then went over to the rebels and accepted service under the Mahdi.

The garrison in El Obeid, when the place was first attacked in August, numbered 6,000 men. When they surrendered unconditionally and took the oath of allegiance to the Mahdi, there were 8,500. The victors obtained about \$2,500,000 in treasure. Iskander was employed by Mohammed Achmed to persuade other Egyptian officials to embrace his cause.

In the spring the English made military preparations to suppress the rebellion. A force of 7,000 infantry, 120 cuirassiers, 800 Bashi-Bazouk cavalry, and about 80 guns, was sent to Khartoum. It was joined on the way by other bodies, which increased the force to some 10,000 troops, and took rockets and howitzers in abundance. The Soudan army was entirely distinct from the regular army organized by Sir Evelyn Wood. It was composed, in great part, of the disbanded troops of Arabi, and contained the most unpromising materials. Some were too old for efficient service, and the majority were enlisted compulsorily. The British had little excuse for again underrating

the power of the Mahdi, who disposed now of a force of 838,000 warriors. But the difficulty of their situation in Egypt, in which they had to consult the interests of the Egyptian bondholders, prevented them from following out the wishes of the Khedive's government to make sure work of suppressing the rebellion. The expedition was sent so late that it was judged best not to take the field until the opening of the dry season in September. Many of the soldiers had belonged to Arabi's army. To test their quality and disposition, a camp was formed at Um-Durman, on the west bank of the Nile, opposite Khartoum. Camels for transport were wanting, but they were procured by the exertions of Alla-ed-Din, the new Governor-General of the Soudan. Some time was consumed in efforts to procure the co-operation of Adam, the Takale chief, who is powerful in the region southeast of Obeid. Col. Hicks, who came to Egypt with the English army, and had been the Khedive's chief of staff, was commander of the expedition.

On the 9th of September the camp at Um-Durman was broken up, and the march up the White Nile begun. The army kept as close to the west bank as the floods would allow. Daem was reached on the 20th of September, and from that place to El Obeid a circuitous route was chosen on account of water. About 8,000 men were left on the way to maintain a line of fortified posts, but the plan of keeping up communications was abandoned, and the army was left to subsist upon their biscuits and what they could obtain from the country.

In the Suakin district, in the beginning of November, an expedition composed of about 500 Egyptian soldiers was conducted by Commander Moncrieff, the British consul at Suakin, and their native officers, against the rebellious Bedouin tribes of the neighborhood. Proceeding by sea, they landed at Toka. The Egyptian soldiers fled before an inferior force of Bedouins, and were slaughtered almost to the last man. On November 12th the rebels advanced to attack Suakin, but were repelled.

The Mahdi advanced to meet Gen. Hicks from Kordofan with an army of 300,000 Soudanese. Hicks Pasha divided his force of about 7,000 into two columns; one being sent on to capture El Obeid, while with the other he awaited the coming of the Mahdi's army at Kaz. The rebel forces were nearer than was anticipated, and the Mahdi had laid his plans skillfully. The first engagement with the rebels was at a point near Namua, where Gen. Hicks encountered and worsted a considerable body of the Mahdi's black allies.

When they reached Namua, near the Obeid hills, Hicks Pasha detached the column which was sent to demand the surrender of the fortress. It was this division which the Mahdi, advancing from the southeast, engaged on ground selected by himself, November 2d. Gen. Hicks, on hearing the firing, came up

with the rest of his forces. Forming a square around the camels and stores, they withstood the fierce and reckless onset of the Soudanese until evening, when the Mahdi withdrew. The Egyptian camp-followers were thrown into confusion by the stampeding of camels, but the troops fought with admirable fortitude. The next morning the rebels resumed the attack, re-enforced by the arrival of well-armed troops from Kordofan, soldiers who had surrendered at El Obeid. The Egyptians held their ground through another day's fighting, but on the third morning the square was broken. The battle-ground had been selected by the Mahdi with his usual sagacity. It was a narrow, rocky passage between wooded hills, in which he had placed the guns and rifles captured in former engagements in positions where they could be used with effect, but where it was impossible for Gen. Hicks to deploy his artillery. Into this ambushade the Egyptian advance column was led by a treacherous guide. The army of Hicks Pasha was totally annihilated. The troops are reported to have fought three days without water, until all their cartridges were expended. Gen. Hicks then ordered a bayonet-charge, but the army was immediately overwhelmed and not a man escaped. The commander-in-chief, with Alla-ed-Din, Governor-General of the Soudan, Abbas Bey, Col. Farquhar, Majors von Seckendorf, Massy, Warner, and Evans, Captains Herlth and Anatyaga, Surgeon-Gen. Georges Bey, Surgeon Rosenberg, O'Donovan, the well-known war correspondent, a number of Egyptian pashas and beys, and all the officers, who numbered 1,200, and soldiers of the army, were slain. All the camels, stores, and munitions, with 36 Nordenfeldt, Krupp, and mountain guns, fell into the hands of the Mahdi.

The annihilation of the main Soudan army at Kashgate left about 4,000 troops in the Soudan scattered in various places. Col. Coetlogon, who was almost the only surviving European in the Soudan, being the next in command, collected these scattered bodies in Khar-toum and the other important posts.

Baker Pasha was at once ordered to Suakin with a mixed force of gendarmes, Bedouins, and Soudanese. To Sebehr Pasha, the former Soudan potentate, was confided the duty of recruiting and leading the black and Arab irregulars. The object of the expedition was to keep open the line of communication between Suakin and Berber, so as to afford an avenue of retreat for the Egyptians in Khartoum and other parts of the Soudan.

The entire province of Sennaar declared for the Mahdi as soon as the defeat of Hicks became known. The majority of the Bedouins of the coast, to secure whose co-operation was the first thought of the Egyptian council of war, which decided on a plan of operations at Cairo, joined the rebellion. The whole Soudan was involved except the fortified trading posts, which were held by feeble garrisons,

and where the loyalty of the black population was doubtful.

After the first detachments of Baker's force had arrived, the forts of Suakin were repeatedly attacked between November 26th and December 1st by the slave-dealing Kabbabish Arabs, who were the Mahdi's efficient allies in the coast-region. On December 2d a force of 500 Soudanese infantry, 200 Bashi-Bazouks, and 200 cavalry marched out from Suakin to attack the rebels. Within three hours' march from the town they were unexpectedly attacked. They were without their Remington guns—most of which were strapped on the camels—but they executed the manœuvre in which the Egyptian soldiers are so well trained, the hollow square, and fought valiantly until the greater part of them were killed. Only fifty are reported to have escaped.

Gen. Baker was detained at Cairo by business connected with transports and supplies for his relief expedition until the middle of December. When he arrived at Suakin he had at his disposal a force of 2,300 gendarmes, 500 of them mounted, 1,500 black troops, and 4,000 Bedouins, with five guns. The gendarmes were under the command of Col. Sartorius, the blacks and half the Bedouins under Sebehr, and the rest of the Arabs under Hussein Pasha. The latter division was to advance up the Nile and join the others, advancing from Suakin, between that place and Berber. In the mean time the posts of Tokar, on the coast of the Red sea, and Sinkat, midway between Suakin and Berber, were beleaguered by Arabs, and the garrisons reduced nearly to starvation.

The Egyptian Government, having been practically deprived of all defensive power by the abolition of its army, could only look to England to restore the provinces which had been lost through the English invasion. The British Government was in a helpless dilemma. It was out of the question to expose British troops to the dangers and privations of a campaign in the Soudan, or to employ Indian troops for such a purpose again, and equally so to burden the Egyptian treasury with the expenses of a war to suppress the rebellion if the troops could be raised in Egypt, or to call upon the British people to help defray them. If the Porte was willing to attempt the reconquest of the Soudan, it would only be at the price of impairing the position of England in Egypt. The rebellion itself was a menace to English interests in the Delta and on the canal. The councils of the English Cabinet were divided on the Egyptian question from the first. Mr. Gladstone himself was opposed to establishing direct British dominion in any shape. The policy of removing the occupying army and leaving the Egyptians to themselves, of letting them "stew in their own juice," as it was phrased, was abandoned. A continued occupation of indefinite duration was now in prospect, perhaps a permanent protectorate. Yet the

abandonment of the Soudan must disappoint and alienate the only class on whose sympathies the English counted, viz., the Khedive and the court and Government circle in Cairo. The movement started in the Soudan might spread to the Arabs of Asia and threaten the power of the Sultan; but it was certain, if Egypt were now abandoned by the British, or unless a line of military defense were drawn and effective measures taken to check the Mahdi's advance, to infect the discontented fellahen of Egypt, inflame their religious passions, and result in a new revolution and war far more desperate and sanguinary than that of Arabi.

The measures proposed by Great Britain were humiliating to the Khedive, but he had no other choice. They were to secure the alliance of the King of Abyssinia by ceding to him the port of Massowah, and to abandon a great part of the Soudan, drawing the new frontier and line of defense from Suakin through Berber to Khartoum. This line it was imperative to hold for the present, for it was the only way of retreat for the Egyptians in the Soudan. Gen. Gordon was sent alone into the Soudan to consolidate whatever well-disposed elements there were remaining in the Soudan, and recede the western provinces to the former sultans.

Baker Pasha entered upon the campaign without definite plans. Except a small sprinkling of Turks, he had no material in his army on which he could rely for courage or fidelity. The former soldiers of Arabi made up the bulk of his command, and they had been driven into the ranks at the point of the bayonet. The black troops recruited by Sebehr were suspected of sympathy with the False Prophet. When they were sent to Suakin it was judged advisable to remove Sebehr Pasha from the command. Baker, who was given supreme military and civil authority, hoped to transform gradually this cowardly and mutinous body by recruits from Turkey and the islands of the Levant. The Abyssinians had made a military demonstration against the coveted port of Massowah, in connection with a revolt of the Cassala tribes. Baker Pasha was empowered to secure the alliance and military cooperation of the King of Abyssinia by agreeing to the cession of the port and adjacent territory. His general instructions were to protect the coast, relieve Sinkat, and reopen the Suakin-Berber line of communication. The rebels withdrew from Trinkitat on the arrival of Baker's troops at Suakin; but the besieged garrisons of Tokar and Sinkat were in extremities. The slave-dealing Arabs of the coast had no direct connection with the Mahdi; they constituted a separate military organization, under the direction of Osman Digna.

Baker Pasha advanced his line to Trinkitat, and then sent an appeal to Cairo for rifles to replace the obsolete muskets with which most of his troops were armed. There were Remingtons in Suakin, but, owing to the neglect or

treachery of the civil officers, they were not delivered. Baker received, in reply to his dispatch, orders to advance at once to the relief of Tokar, which had been thrice attacked. The belief in the irresistible destiny of the Mahdi prevailed among the troops, while European and Egyptian officers were alike persuaded of the hopelessness of the operation. Yet he set out from Trinkitat with 8,000 men, and, on February 6, 1884, advices arrived in Europe stating that a body of Osman Digna's forces had routed this last Soudan army not far from Tokar. The Egyptians made no stand. In the confused flight to Trinkitat, about 2,000 were lost. The remnant were got on a transport by Gen. Baker, and escaped to Suakin. British marines landed there to hold the forts against an attack from without, or from an insurrection in the town. A few hours later the news arrived that 400 of the garrison at Sinkat, which was now reduced to subsist on herbage, in attempting to cut their way through the line of the enemy, were overwhelmed and the entire detachment destroyed. On the 12th came the news of the annihilation of the remaining 600 and their brave commander, Tewfik Bey, who, when the final stage of hunger was reached, spiked the guns, blew up the forts, and sought death in battle at the head of his troops.

ELECTRIC LIGHTING, PROGRESS OF. Electric lighting has now reached a condition in which striking and fundamental inventions have ceased to appear. The main lines along which future improvement must go have been laid down, and attention is now being given to those matters of detail in the construction of apparatus necessary to secure good working and greater economy. Whatever may be the improvements effected in the future, it is very certain that the incandescent lamp has taken its final form, namely, that of a strip of resisting material inclosed in an exhausted vessel, while it appears reasonably probable that the regulator arc-lamp will maintain its ascendancy, though the combinations of parts which may be made in this type of lamp can be so greatly varied that it is difficult to pick out with certainty the surviving forms. Hitherto, the regulator lamp, having its carbons placed end to end in a vertical line, has given the best photometric results, and been most extensively used. Its extreme unsteadiness, and the fact that, for most uses, it furnishes too strong a light at one center, renders, however, its prospect of permanence less certain than that of the incandescent lamp. Whether the regulator will give place to lamps which obtain increased steadiness by the interposition of a refractory material in the arc, such as the sun-lamp, or to those giving a light due partly to an arc and partly to incandescence, such as open-air incandescent lamps, the future can only decide. With incandescent lamps progress must consist in the improvement of the light-giving body, so that they will be able to stand

higher temperatures safely. These lamps are being continually improved in this direction, the lamps of to-day being very much better than those of a year or two ago.

Two new lamps of this kind have recently attracted considerable attention, though they do not appear to possess any advantage over previous ones. In one of these the light-giving carbon is in the form of a hollow tube, and in the other it consists of a platinum wire with a carbon coating. The former of these is the invention of Mr. Alexander Bernstein, of Boston, and the latter of Signor Cruto, of Turin. In manufacturing his tubular carbons Mr. Bernstein at first carbonized straws, and later deposited carbon from a carbonaceous gas or liquid upon a metal mandrel, which latter was afterward dissolved out by acids. This method was, however, abandoned, and the carbons formed by wrapping paper about a rod, the successive layers of paper being made to adhere by gum or paste. These paper tubes were then carbonized, in the ordinary way. Owing to the great shrinkage undergone by them in process of carbonization, the paper was finally replaced by a closely-woven textile fabric of cotton or silk. The inventor has been able to produce his tubes in the form of a bow, so that in external appearance his lamp does not differ materially from those now in use. These carbons are said to be highly elastic, so much so that they can be bent nearly straight, and will spring back to their normal shape. The lamp differs, further, from present lamps in being of quite low resistance, which will prohibit its use in any extensive multiple-arc system of distribution. The inventor, however, contemplates placing them in series as is done with arc-lamps. At the recent Exhibition of Electricity, at Vienna, a number of these lamps were shown of 65 and 150 candle-power. The appearance of the lamp is shown in Fig. 1.

The filament of the Cruto lamp is made by raising a platinum wire to incandescence in a carbonaceous atmosphere, the carbon being deposited upon the wire in the same way as it is upon carbon filaments in the "treatment" to which these are subjected by some of their makers, to render them homogeneous. Another incandescent lamp of a decidedly novel character has been patented in England by Messrs. Boullon, Probert, and Soward, though it does not appear to have been publicly shown in operation as yet. Instead of first making the filament and then mounting it upon leading-wires and sealing them into a glass globe, as is done in all other lamps, these inventors manufacture their filament by means of the current after they have sealed the leading-wires in place in the globe. To this end they introduce two platinum wires in a glass envelope, the inner ends of these being the distance apart of the intended length of the filament. A carbonaceous gas is then introduced into the globe, and a carbon bridge built across from one wire to the other by passing electric

sparks between the platinum electrodes. The inventors state that they are able by this means to produce a carbon filament of great purity, and one which, being formed under the influence of the current, is not disintegrated by the

FIG. 1.

prolonged action of the current upon it. The apparent objection to forming a filamentary conductor in this way is the difficulty of obtaining a filament of uniform section, which is essential to permanence, as otherwise there will be spots throughout the conductor at greater temperature than the remaining portions, and the filament will tend to give way at these points of greater strain.

In dynamo-machines, though new varieties continue to be brought out, there is but little of importance to chronicle. An improvement in the construction of dynamos for incandescent lighting has, however, been patented during the year by Mr. Edward Weston, which deserves notice here. As is well known, incandescent lamps are arranged in what is termed multiple arc—that is, one terminal of the lamp is connected to the outgoing and the other to the return conductor. Each lamp, therefore, takes its own supply of current independently of all the rest. In order, however, that the proper amount of current should pass through each lamp, the electromotive force of the current should remain constant, however the amount of the current varies as lamps are turned off and on—that is, the difference of potential between the terminals of the machine must be unvarying. Mr. Weston succeeds in fulfilling this condition by establishing a certain relation between the armature and the field.

As is well known, the brushes of a dynamo, instead of resting upon the commutator at

the theoretical maximum points—the points joined by a line at right angles to the line drawn through the center of the field-magnet poles—are in practice given a lead, or displaced in the direction of rotation. According to Mr. Weston, the reason of this is that the field-magnets tend to induce magnetic poles in the iron core of the armature in the line joining their poles, while the rotating coil of wire wound on the core tends to induce poles in this core at points at right angles to this. The real maximum points are, therefore, on a line between the theoretical ones and that joining the field-magnet poles. The position of these points changes with every variation of the strength of the field-magnets due to variations in the current flowing in the field-coils, while the position of the brushes remains unchanged. That the difference of potential between these should remain constant, it is necessary that the position of the maximum points should not change, and this will be the case when the actual and theoretical positions coincide.

To realize this it is only necessary to make the magnetic effect of the field upon the armature-core so greatly preponderate over that of the wire upon it that the effect of this latter is inappreciable. This he accomplishes by making his field-magnets of great strength, winding but a single layer of wire upon the armature-core, and making this core, which consists of a number of sheet-iron disks, with projections which come close to the face of the magnet-poles. With this construction Mr. Weston states that the theoretical and actual maximum points so completely coincide that the machine can be run in either direction without changing the position of the brushes. The dynamo is shunt-wound—that is, the field-magnets are placed in a shunt to the main circuit.

Mr. Edison has continued to improve the details of his system, his latest improvement being an important modification of his system of distribution by means of which the cost of the conductors is materially reduced. Heretofore he has used the simple multiple-arc system. In this system each lamp requires its own supply of current, so that, to maintain a hundred lamps, one hundred times the amount of current must be transmitted as to maintain one. If, however, the lamps be arranged on a multiple-series system—that is, a system in which each cross-circuit contains two or more lamps arranged in series—the supply of current will depend upon the number of series circuits and not upon the individual lamps. Thus, if two lamps be placed in series, only one half the current will need to be transmitted which would be required in the simple series. If three lamps are placed in series, only one third the current will be required, and so on. The electro-motive force of the current must, however, be proportionately increased. The defect of this arrangement is that the lamps

are no longer independent of each other: whenever one of a series is turned out, all of that series must be. If they were not, they would be destroyed by the increased current which would flow through them on account of the diminished resistance of the cross-circuit in which they are placed.

Mr. Edison has, however, succeeded in devising a way of rendering the lamps in a multiple-series circuit independent of each other, and thus rendering it as practicable for a general distribution as the simple series. How he accomplishes this is shown in Fig. 2, which represents three lamps arranged in series on

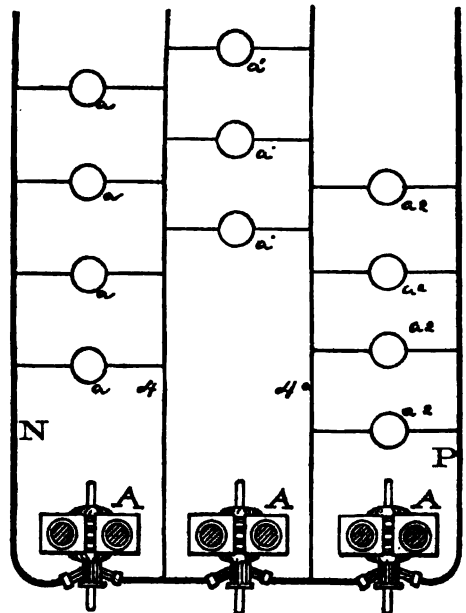

FIG. 2.

each cross-circuit. The dynamos A, A, A, are connected together in series, that is, one after another. The two main conductors, P and N, are connected, the one to the positive pole of the first machine and the other to the negative pole of the last. Between each line of lamps compensating conductors, as Mr. Edison terms them, are run to the generators and connected with the conductor joining them, as shown. With this condition of things, when the same number of lamps are in each circuit, no current will flow through the compensating conductors, but will pass from the main positive conductor through each cross-circuit. When, however, the number of lamps is unequal in two adjacent circuits, the excess of current above that necessary for the smaller number of lamps will flow through the compensating conductor between them. In practice, the circuits would be so arranged that the number of lamps in adjacent ones would be nearly the same all the time. The compen-

sating conductors may therefore be quite small and inexpensive. This method of distribution is applicable to cases in which but one generator is used, the compensating conductor then being connected to an extra brush on the machine placed between the two other brushes, as shown in Fig. 3. This method of distribu-

FIG. 3.

tion has not as yet been put into use, but Mr. Edison designs to employ it in the next electric-light district which is soon to be established in New York. The great importance of this system of distribution will be appreciated when it is remembered that even with the high-resistance lamps used by Mr. Edison the cost of the street mains is equal to the entire generating plant, and that the great outlay necessary for plant is to-day the chief obstacle to furnishing the electric light cheaply.

The system of distribution, which consists in placing the lamps or other apparatus to be used in the secondary circuit of an induction-coil, the primary coil of which is in the main circuit, has been proposed by various inventors in the past few years. Mr. Edison himself took out some patents on this method of distribution, though he has never put it into practical use. M. Jablochhoff, in 1877, used this system with his candles, employing for this purpose an alternating-current generator.

The late J. B. Fuller also proposed to use the system in 1879. His induction-coils were made by winding over an iron core coils of coarse wire at each end and a fine-wire coil at the middle, the former being included in the main circuit, and the latter forming the local circuit in which the lamps were placed. Any number of such induction apparatus or groups of them may be placed on a circuit in series which the tension of the current will permit, and by connecting the fine-wire coils in series or in multiple the intensity or the tension of the lamp-current may be varied within wide limits. The death of Mr. Fuller cut short his experiments in this direction, so that his apparatus was never made practical use of. The secondary current was also employed by Professors Thomson and Houston for operating their vibratory arc-lamp. For this purpose each lamp was placed in a separate secondary circuit, and by means of an electro-magnet, one of the carbon electrodes, usually the negative, was given a rapid vibratory motion to and from the upper positive carbon. This form of lamp was, however, abandoned by them, and they subsequently resorted to an arc-lamp operated in the ordinary manner by a continuous current. Various other inventors have patented different forms of induction apparatus, but none of them have passed into actual use. Quite recently, however, this method has been revived in England by Messrs. Goulard and Gibbs, who have put the system into operation along the line of the London Metropolitan railway (underground).

They construct their induction-coils by forming each circuit—primary and secondary—of cables containing a number of wires, and then winding these cables as the wire is ordinarily wound on such apparatus—that is, the coarse wire on a central paper or other insulating tube, and the secondary over this. The iron core is composed of a bundle of wires, and is contained within a brass cylinder, by the withdrawal of which the strength of the secondary current can be regulated, and consequently that of the lights. The primary coil is in the main circuit, through which is sent an alternating current from an alternating-current dynamo. This current is of high tension, but, as this circuit is a permanently closed metallic one, there is no danger from the system on the score of the tension of the main circuit current.

Messrs. Goulard and Gibbs combine a number of their induction-coils into one apparatus of sufficient capacity to do the lighting required—say, that of a private house—and connect the coils so that any desired combination of them, in series or multiple, may be made. The secondary currents can therefore be made to give currents of high tension suitable for a number of arc-lamps in series, or low tension such as are required for incandescent lamps in multiple. In the installation on the Metropolitan railway five stations are lighted, each

one being provided with an induction apparatus, or "secondary generator," as the inventors term it. The main line consists of a copper wire but one sixth of an inch in diameter, and is of a total length, out and back, of fifteen miles. At each station a portion of the coils are grouped in multiple arc for the supply of Swan incandescent lamps, and others for both regulator arc-lamps and Jablochkoff candles. As each different class of lamps has its own circuit quite distinct from the others, all sorts of electrical apparatus can be readily used without difficulty. This constitutes an important advantage over the system of direct supply, as arc and incandescent lamps can not be successfully worked in the same circuit. The only way in which the two can be supplied by the same street conductors is by the use of the secondary battery. No tests of the loss due to the secondary generator system have yet been published, and we can not therefore estimate its economic value. The extreme flexibility of the system, however, will give it a prominent place in the distribution of electricity, if this loss be not too great.

The storage-battery system of distribution for incandescent lamps has made but little headway during the year. Despite the flourish with which successive improvements in secondary batteries have been announced, this apparatus is still in an experimental shape. Experience has shown that the battery deteriorates rapidly in use, its first cost is high, and its return is too low to make its use as an element in a distributive system economical. Whether it can be converted into a practical commercial apparatus remains to be seen, but the present opinion in the electrical world is not hopeful of its future.

ENGINEERING. The year 1888 saw the completion in the United States of two of the most remarkable high-level bridges in the world, one of the wire-suspension type, identified with American engineering, the other on the cantilever principle, a new and important development, the merit of which may be ascribed more particularly to the English school of engineers. Two more of the great transcontinental railroads were completed within the year, and American enterprise is pushing the reticulations of the American railroad system into Mexico. A great ship-canal is projected across the isthmus of Florida. The Congress of Nicaragua in October, 1888, authorized the Government to guarantee, in association with the other governments of Central America, 3 per cent. interest on the capital of the projected Nicaraguan canal for twenty years after the completion of the canal, which capital shall not exceed \$75,000,000.

In Europe the Channel tunnel project was condemned on strategic grounds by a Parliamentary Commission. The Manchester ship-canal met with political opposition, and the project has been altered from that of a tidal water-way for ocean-steamships to a plan for

a canal with locks, which would accommodate barges and some of the smallest of the transatlantic steamers. The obstruction of this promising scheme illustrates the difficulty of carrying out great public improvements in Great Britain, where monopolies not only wield political power but possess, as "vested interests," a legal status, which is not accorded to an equal extent in any other state. The "plateway" between Liverpool and Manchester has been given up. The third great Alpine tunnel has been bored by the Austrian Government. The works on the isthmus of Corinth and Panama canals are progressing, and under the same auspices the project of inundating the Algerian *chotts* is assuming definite shape. The Suez-canal controversy has given rise to several projects, the most probable and practicable of which is that of enlarging the present canal and building a second one of equal size to accommodate the return traffic. In Germany a canal is proposed from Strasburg to the Rhine, which, by connecting with the French system of canals, would establish water-communication between the North sea and the Mediterranean.

The old project of a Euphrates valley railroad has been taken up by the Sultan, who believes that such a railroad would in Asia have turned the scale of victory in the last Russian war. The latest plan is that of Lerkis Bey Ballian, who proposes to carry the line from Saladih (Seleucia), at the mouth of the Orontes, to Bagdad, 690 miles. Another, the Caralet project, would make the western terminus at Alexandrette, opposite Cyprus. There are several others, new and old. The promoters must be satisfied in their demands on the Porte with extensive land-grants like those given to railroads by the United States Government. The improvements of the Danube are to be extended as far as practicable up to the Iron Gate, and the dangerous reefs in that remarkable chasm, which necessitate the unloading and reloading of steamers passing through, are soon to be cleared away.

The harbor-works at Trieste, which have taken fifteen years of labor and an expenditure of \$7,300,000, were completed in 1888. By running out three piers, 700 feet long and from 250 to 275 feet broad, the old roadstead, which was exposed and insecure, was converted into three basins, 85 acres in extent each, with from 26 to 43 feet depth of water. A mole 3,600 feet long, running parallel with the shore at the distance of 1,000 feet, protects the harbor from the northeast, southeast, and southwest winds. A pier 250 feet long, projecting in the direction of the northeast end of the breakwater, at right angles to it, gives a protected entrance to the haven 315 feet in width. The length of quays in the basins is about two miles. The soil is so unstable that the quay walls had to be reconstructed about a year after they were built. The Italian Government is engaged in naval harbor works on an

extensive scale. In Belgium and other countries harbor improvements are in progress. The proposed tunnel under the strait of Messina will have a total length of 18,546 metres, of which 4,688 metres lie under the strait. The estimated cost is \$14,200,000. A bold scheme for a bridge across the strait, with spans of over 1,000 yards, also finds advocates.

Enlargement of the Suez Canal.—The question of widening or duplicating the Suez canal to accommodate the traffic which has outgrown its capacity, is still in the phase of political controversy, and in its politico-commercial aspect is treated in the article on the SUZ CANAL. The opposition which seeks to nullify the franchises and abrogate the concessions of the Suez Canal Company, on such fallacious grounds as that the exclusive right to construct "a" canal meant "one" canal, or that, if other companies were debarred, the Egyptian Government could make a new canal, on the arbitrary plea that Said Pasha had no sovereign right to grant privileges over an international highway, or the simple argument of might, finds its *animus* in the desire of British ship-owners to compel the company to reduce the rate of toll allowed in the concessions, just as in the early period of its operation they compelled the directors of the canal to adopt the Moorsom system, which deducts the space occupied by engines, fuel, etc., in rating the capacity of vessels, instead of levying ten francs a ton on the real capacity of a ship. M. de Lesseps was less alarmed at the threats of an alternative canal, from the fact that his canal occupies the *Thalweg* of the isthmus.

Of the different schemes to take the improvement out of the hands of the Suez Canal Company that were proposed, those which took no account of the rights of the company were naturally of a bold and visionary character. The project of a fresh-water canal from Alexandria to Suez by way of Cairo was recommended on the ground of its combining irrigation with navigation. It was formerly entertained by the Khedive Ismail. But, aside from its cost, it was out of the question to expose the great and increasing commerce of the Suez route to the delays and accidents of a long canal, whose navigability depends on the workings of a system of locks. A still more adventurous scheme is that proposed by Gen. Gordon, to create a new passage from the Mediterranean to the Red sea by flooding the depressed valley of the Jordan. This scheme was broached twenty years ago, and was objected to not only on religious grounds, but from the stand-point of engineering science. Calculations were made to show that it would take a full century for a stream 90 feet broad and 15 feet deep to fill the depression, owing to the extraordinary evaporation and absorption in that region. Gen. Gordon, after studying the natural conditions of the Jordan valley, came to the conclusion that by cutting a canal 60 yards wide and 8 yards deep from

Haifa, the gulf of Acre, to Zenn, 25 miles, and another from the head of the gulf of Akabah to Ain Gerundel, 40 miles, the intermediate depression, 825 cubic miles in extent, will be flooded in nine months' time. The inland sea, thus created, filling the Jordan bottom and Dead sea basin from Lake Huleh to Ain Gerundel, with the two short cuttings, which could be dug at a cost of \$55,000,000, including port works at Herifa, would furnish a navigable water-way through which vessels could steam at full speed in a minimum depth of 40 feet of water. It would be scarcely wider than the Dead sea, and would submerge only a small portion of the fertile lands of the Jordan valley, and none of the important sites of religious interest. Many other advantages, commercial, political, and sanitary, are adduced by the advocates of this scheme.

The alternative scheme, of a second canal constructed across the isthmus with English capital, to compete with the Lesseps canal, would have serious financial and technical problems to solve, after overriding the legal difficulty and braving the danger of a rupture with the French Government. Shut out from the Great and Little Bitter lakes and Lake Timsah, a canal of sufficient section to suit the present requirements of navigation would require three times as much excavation as the Suez canal did, and without the forced labor which M. de Lesseps had at his command. The Suez Company would be unwilling to convey the plant and supplies to the different points along the line. There would also be two new entrance-ports to create at an enormous cost.

As relates to the improvement of the Suez canal, the practical problem in engineering resolved itself into the question whether it would be better to enlarge the present canal or excavate a new one by the side of it. The second proposal had the recommendation of greatly diminishing the risk of a total stoppage of the route, of obviating the necessity of stopping at sidings to allow other vessels to pass, and also the danger of collision between vessels going in opposite directions; on the other hand, it had the disadvantage of requiring more labor and outlay, and of increasing the working expenses for supervision and administration, and for repairs.

The Works Committee of the Suez Canal Company, in January, 1888, adopted the following programme of improvements which were expected to double the present capacity of the canal:

Rectification of the west bank of the channel of the outer port of Port Said; formation of a new basin at Port Said; widening of the canal in the passage of the small Bitter lakes; widening of the canal between Suez and Kilomètre 152; doubling of the Iamalia station; embankment of Kantara station, and of the station at Kilomètre 133; rectification of the eastern curve of Timsah station; also of the southern curve of the small lakes; also of the northern curve of El Guisar; also of the curve of Toussoum; widen-

ing of the canal off Port Tewfik; deepening of the basin of Port Tewfik; and the continuance of the masonry-work.

They at the same time suggested the advisability of cutting a second canal parallel to the first, in anticipation of a still greater traffic. This scheme was the subject of the negotiations between M. de Lesseps and the British Government. The section of the Suez canal is too small for vessels of such dimensions as are now built for the Indian and Australian trade, irrespective of the question of overcrowding and blockades. The passage is too narrow and shallow to allow them to steer properly, particularly at such a slow speed as five knots an hour, the maximum in the present canal. It was on this account that the English ship-owners, in their conferences with M. de Lesseps in the latter part of the year, urged the necessity of enlarging the section of the present canal as more pressing than that of separate channels for vessels going in opposite directions. He promised to meet their views and have the plans for the improvements drawn up on the basis of an enlargement of the present canal, which will take precedence, and a correspondingly larger sectional area in the projected parallel passage.

Isthmus of Corinth Canal.—The Isthmus of Corinth canal, which was begun in the spring of 1882, and is expected to take four years, proceeds with greater rapidity since the introduction, in the autumn of 1883, of gigantic steam-excavators constructed in France. The length of the canal is 6,342 metres. Its depth and width are the same as those of the Suez canal. It will save ships from the Adriatic trading with Greece, Turkey, the Danube, or the Black sea, as much as 185 marine miles, and those from the Mediterranean and Atlantic about half that distance. At present 5,800 large steamers and 300 war-vessels, besides a large number of sailing-craft, sail around Cape Matapan every year, enough to furnish the canal, to begin with, a traffic of nearly 6,000,000 tons. The site of the new town of Isthmia, at the Ægean outlet of the canal, is exceedingly healthful. There was no mortality among the workmen from climatic causes during the first year's operations.

Sahara Sea.—M. de Lesseps, after a personal examination of the route of the canal with which Commandant Roudaire proposes to inundate the *chotts* of Tunis and Algeria, declared his adhesion to the project, which he has favored from its inception, and aided in its preliminary stages. The *chotts*, or alkaline basins, depressed below the level of the Mediterranean, extend in an irregular chain from Gabes to the town of Biskra in the desert, 300 miles inland. The large lake which would be formed by flooding the depressed area would be not less than 2,000 or 3,000 square miles in extent, and deep enough to float the largest vessels, which could enter easily by the nearly straight canal. The creation of such a landlocked sea

would render fertile a broad belt of desert-land to the north, constituting the whole interior of Algeria and Tunis, where there are numerous fresh-water wells, and where nothing but rain is wanted to make the soil exceedingly productive. The cutting would be through sand, except in some places where a calcareous rock is met with; which, however, is hardly more than sufficient to furnish materials for breakwaters, piers, and buildings. The total cost is estimated by M. de Lesseps at 150,000,000 francs, and the time to complete it five years.

Panama Canal.—The works on the Panama canal are progressing, though, from the inability of M. de Lesseps to raise a new loan in the spring, it is evident that the feasibility of carrying out some important features of the original plan is doubted. The reports of the director-general, M. Dingler, on the excavations are encouraging. The quantity of earth to be removed is placed at 100,000,000 cubic metres, instead of 80,000,000 as previously estimated; but the absence of the expected rock excavation, and the looseness of the soil, reduce the estimated cost from 10 francs a metre to about one third of that rate. Much of the excavation is done by negro laborers, who work more cheaply than the machines which were brought for the purpose. M. de Lesseps estimates the total cost at 500,000,000 francs, not including the reserve fund of 100,000,000 francs for unforeseen expenses. He asserts positively that the canal will be completed within the five years originally calculated, which end in 1888.

The proposed high dam in the valley of the Chagres is one of the most dubious features in the canal plans. The reservoir at high water is to cover an area of 6,750 acres, and contain 1,000,000,000 cubic metres of water. The directory has abandoned the idea of building the canal without locks, and determined to make a lateral canal and three locks at Panama.

The total length of the canal from the Atlantic to the islands of Naos and Flamenco, where it joins the Pacific, is 74 kilometres. It is divided into 12 sections, the most important of which are Colon, Gorgona, Obispo, Emperador, Culebra, and Paraiso. On all the sections 30 steam-excavators, 40 locomotives, and 800 tip-wagons were at work in the autumn. The force of laborers was then 10,000 men, which number was expected to be augmented at the beginning of the fine season in December to 15,000. About two thirds of the grand cutting between Obispo and Paraiso was excavated by Oct. 15th. It is expected that in 1884, when all the machinery will be on the ground, the excavations will proceed at the rate of 4,000,000 cubic metres a month. On Oct. 15th the harbor-works at Colon were nearly completed. An entire town had sprung up there, with numerous workshops and warehouses, and connecting railroads for the distribution of material. The *terre plein* and breakwater were finished. A cutting was opened at the spot

called Monkey Hill, with the object of filling up the lagoons at the bottom of the bay of Colon, in order to improve the sanitary conditions. The 120 horse-power dredgers remove, each of them, 6,000 cubic metres of earth a day. The machines of the Franco-American Trading Company, which were built in Lockport, N. Y., excavate 2,000 metres. This company has contracted to dig the Pacific opening from the mouth of the Rio Grande to Paraiso within the term of two years.

Florida Ship-Canal.—A project for a tide-water canal across the upper part of the Florida Peninsula has been taken up by a company formed for the purpose. The commercial prospects of this canal are more encouraging than those of the again intermitted Cape Cod cutting, for the 800 miles of navigation which it will save were described by Commodore Maury as being as dangerous as any in the world. The annual losses from wrecks on the southern coast of Florida are computed to amount to \$5,000,000. A saving of 1 per cent. in insurance is therefore counted on. The commerce which goes through Florida Pass annually is said to be three times as great as the traffic of the Suez canal. The route selected is from a point on the Suwanee river, to a point above Jacksonville on the St. John's river—a distance of somewhat over 60 miles. The estimated cost is \$20,000,000.

The Iron Gate.—The removal of the obstructions in the cataracts and narrows of the Danube, called the Iron Gate, at the point where the Austro-Hungarian, Servian, and Roumanian boundaries meet, was attempted in 1781, and again in 1834. The scheme has been deferred up to the present in pursuance of the protective policy of the Austrian and Hungarian Governments, which feared the competition of foreign manufactures, and even of American grain. In 1893 it was again taken up, and arrangements were made for the final execution of this important and difficult work of engineering. On June 4th, an accord was reached between the Austrian and Hungarian ministries, in a conference at Vienna, by which the Hungarian Government undertook the regulation of the river. The agreement of Servia and Roumania was obtained. The cost is to be reimbursed by the levy of tolls for the period of ninety years. The various estimates range from 10,000,000 to 22,000,000 florins. The general plan which was adopted was worked out by the American engineer Mac-Alpine.

Diversion of the Syr Darya.—Schemes for changing the course of the Syr (Jaxartes) and that of the Amou (Oxus) have been under the consideration of the Russian Government for some time. Both of the principal rivers of Turkestan have followed different channels at different periods. The partial diversion of the Syr into the bed of the Jany Darya is a work of no great difficulty, as it was accomplished by the Kara Kalpaks about 1760. The river

was turned into its former course by means of a dam constructed in 1837 or 1838, by order of the Khan of Khiva, to prevent the Russians from using it as an avenue of approach to his capital. In 1853 the Russians broke the dam and allowed the waters to flow into the dry bed of the Jany Darya, but finding that the Syr Darya was rendered too shallow for steam-boat communication, they restored the work. In 1883 a channel was reopened, and the water soon penetrated as far as Irkibai. Whether the main volume of the river can be diverted into the new course, and whether it can be made to flow into the Amou or the Sea of Aral, is still doubtful. The work already accomplished will restore fertility to a large portion of the Kizil Kum desert, and improve the military and caravan communications with Khiva and the Amou Darya station.

Drainage of Lake Okechobee.—The reclamation of swamp-lands on an enormous scale has been undertaken in Florida by an association of American and English capitalists. The Florida Land Improvement Company, organized by Hamilton Diston, of Philadelphia, in addition to 4,000,000 acres of State lands which were obtained by purchase, selected, and in great part resold, one half being taken by an English syndicate and several hundred thousand acres of the remainder by other purchasers, received authorization to drain the Okechobee district, covering 11,000,000 acres, on terms giving the company for its service one half of the land reclaimed. There are some sections in the overflowed lands, as well as in the pine-lands of Southern Florida, which are supposed to be as well adapted to the cultivation of sugar as any soil in the world. The cane can be harvested in saccharine maturity, as the region is south of the frost-line; but whether it will propagate itself for a succession of years by ratooning, as in Cuba, is not yet established. These lands are also suitable for jute, which is grown in Florida of a superior staple and luster. The feasibility of draining Lake Okechobee was established in 1879, in a survey ordered to be made by the Federal Government. Col. Meigs, who conducted the survey, calculated the level of Lake Hickpochee, connecting with Lake Okechobee, to be 22 feet above mean low tide. A survey made in 1881 demonstrated that the elevation of Lake Okechobee above the low-water level of the Atlantic ocean was 25 feet. When Lake Okechobee overflows its banks and backs the waters of its numerous tributaries, submerging the entire surrounding country, a portion of the overflow finds its way into the Gulf of Mexico by sluggish and tortuous channels through Coloosahatchie river and other outlets. The company began to cut a canal from the Coloosahatchie in January, 1882, and made connection with the lake on Dec. 10, 1882. A steady current set through this channel, which relieved a large surface of swamp-land adjacent to the

lake, and lowered the level of the neighboring lakes. The outlet canals connecting Okechobee with the Coloosahatchie river are to be made navigable. The first one made is 52,000 feet long. The company next deepened and straightened the Kissimnee and Little rivers which connect the Tchopcaliza lake with Okechobee. Canals 6 feet deep were cut, and a current was obtained of 2½ miles an hour. By May, 1883, the level of the upper lake had fallen 5 feet. At that time 380,000 acres had been redeemed. The excavation was done entirely with steam-dredges.

Hull Harbor Improvements.—The new dock at Hull is intended to meet the growing demands of a port which, next to London and Liverpool, has the largest commerce of any in the British Islands. In connection with the New Barnsley railway, running to the Yorkshire collieries, the new dock enables Hull to become a large coal outpost. The Humber brings ships of deepest draught up to Hull at any state of the tide. Besides the river Hull, which winds through the town and constituted the old harbor, but which is available only for small vessels at high water, there were seven wet docks with a total area of 76½ acres. The new basin, called the Alexandra dock, is 46½ acres in extent, and a new one in course of construction contains 10½ acres, giving the city a total area of wet-dock accommodation of 133½ acres. The Alexandra dock will accommodate the large vessels engaged in the grain-trade with California and India. To construct it, 150 acres of the foreshore were reclaimed by embanking, of which 100 acres are occupied by the wet dock and two graving docks, their quays, warehouses, roads, railways, etc. The works have a frontage on the river of 6,000 feet, and a depth of 3,500 feet. The dock is 2,300 feet long by 1,000 wide. It is entered through a lock 550 feet long and 85 feet in width, having three pairs of gates and a caisson at the entrance. The sea-bank between the basin and the river is 1½ mile long, being composed of 200,000 tons of chalk, faced with stone, with an outward slope of one in two. The trumpet-shaped entrance, 360 feet wide, is formed by timber wharves built upon creosoted piles. The depth over the sill is 34 feet at high spring-tide. There are two jetties 400 feet long, and one of 450 feet, within the dock. All the cranes, capstans, and other appliances, as well as the gates, valves, and sluices, bridges, and hoists, will be worked by hydraulic machinery. This is already applied in a novel manner in the work of excavation. A hydraulic navy is used, which is capable of removing 600 to 700 cubic yards of earth a day. Unlike the steam navy, it can not be thrown out of order by giving it more work than it can do, as it stops when driven beyond its capacity, so that it can not get strained. Another advantage is that it takes only two men to operate it. It is self-acting, depositing the earth in tip-wagons on either side as fast as they can

be unloaded and brought up again. Hydraulic power is used also in drawing the barrows which bring the excavated material up an incline to the banks, where it is used for filling up. The larger of the two graving docks is 550 by 65 feet at bottom, with 21½ feet of water on the sill; the larger one is 512 by 81 feet, with 19½ feet of water. The pumping-engines used in emptying the dry docks are employed also in maintaining the water in the main dock at the proper level, the supply being drawn from an inland stream which is freer from sediment than the Humber.

Arlberg Tunnel.—The headings met in the great tunnel through the Arlberg in the Rhoetian Alps on Nov. 14th. The tunnel is nearly 6½ miles long, taking rank immediately after the St. Gothard and Mont Cenis tunnels. The exact length of the new tunnel is 10,270 metres, that of the Mont Cenis tunnel 12,323, that of the St. Gothard tunnel 14,900. The object of the work is to shorten the distance between Austria and Switzerland, and to give Austria direct communication with the railroad systems of Western Europe and render her independent of the South German railroads over which the traffic has hitherto had to pass. Starting from Innsbruck, the new line is carried along the right bank of the Inn to Landeck. At that point the difficult part of the work began. From Landeck to St. Antoine, where the road enters the tunnel, the total rise is 1,721 feet. The gradient in the valley of Rosanna is one in forty. The distance between Landeck and Bludenz, the other terminus of the road, on the opposite side of the Arlberg in the Austrian province of Vorarlberg, is 35 miles. This section is a mountain railroad all the way. The Panznau valley is crossed by a bridge of three arches, each of 197 feet span. The tunnel first planned by Gen. Nordling, who surveyed the route, was a smaller one higher in the mountain; but the Austrian Government determined not to spare expense in a work of so great political and commercial importance, and the tunnel was made longer, in order to lessen the grades, and wider, so as to accommodate two tracks instead of one.

The work of boring began in June, 1880, on the Austrian side. On the Swiss side the heading was started in September of that year. The perforators used on the Austrian side were percussion drills, constructed on the same system as the machines employed in boring the Mont Cenis and St. Gothard tunnels. A series of 20 or 25 chisels, covering a space of 7 square metres, were driven into the face of the heading with blows imparted in rapid succession by compressed air. The machines were actuated by turbines at the end of the gallery. The chisels penetrated the rock from 1½ to 2 metres. The holes were then filled with dynamite and the blast exploded, lengthening the drift about 1½ metre. The perforators moved on wheels. The compressed air was applied

under a pressure of five atmospheres through flexible tubes. On the Swiss side the new Brandt perforator was employed. This machine excelled the performance of the Ferroux apparatus used at the other end, which is the latest improvement in the percussion perforator. The new perforator consists of six or eight veritable drills, with a diameter of 70 millimetres, which bore into the rock with a rotary movement under a hydraulic pressure of from 60 to 100 atmospheres. The difference in the speed at which the work proceeded in the different Alpine tunnels shows the progress made in boring machinery. The Mont Cenis tunnel advanced at the rate of 3,637 feet a year; the St. Gothard at the rate of 5,474 feet; and the Arlberg at the rate of 7,080 feet. The improvements reduce the expense in a still greater ratio, the Arlberg tunnel having cost only \$750 per lineal metre, as compared with \$1,250 per metre in the St. Gothard, and \$2,000 in the Mont Cenis works; although a part of this saving was due to the relative shortness of the Arlberg bore.

The work of carrying away the excavated material in mountain tunneling is as difficult, and consumes quite as much time, as that of excavating. The gases from the explosives render this task unwholesome and sometimes dangerous. In the Arlberg the miners escaped ill effects by covering their mouths and nostrils with sponges steeped in vinegar.

At first, owing to the hardness of the rocks on the western side, and to the inflow of enormous quantities of water, the stipulated rate of progress, about ten feet a day, could not be made; but after the water was subdued the advance was more rapid than the prescribed speed. The gallery was driven on a level with the bottom of the tunnel, and not, as formerly, on the Belgian system, i. e., on a level with the top. The cost of the tunnel itself is estimated at 18,000,000 florins, including the premiums earned by the contractors for early completion, in which premiums they allowed their workmen to share. The cost of the whole line will be about 40,000,000 florins.

Mersey Railway Tunnel.—The headings of the tunnel under the river Mersey met in the center before the end of the year. Though insignificant in length, the river being less than a mile broad at that point, this tunnel is a work of great difficulty, owing to the low level at which it has to be carried under the deep waters of the Mersey, the toughness of the new red sandstone, the amount of pumping necessary to remove the immense quantity of water which perforates through this porous rock, the work of lining the gallery to stop this inflow, and the precautions which were necessary against a possible fault in the geological formation and the inrush of water from the river. Fortunately, the stratum was found to be continuous. The roof of the tunnel is separated from the bed of the river by a thickness of 30 feet. The length of the tunnel is 1,753 yards.

The seven-foot heading was excavated partly with Col. Beaumont's boring-machine, which was set for $\frac{1}{4}$ inch per revolution, equal to $\frac{1}{4}$ inch per minute, which was a slower speed than was made in the gray chalk of the Channel tunnel. Through this seven-foot drift-way the water which entered flowed down the incline to the shaft at each end and was got rid of by means of the steam-pumps. The tunnel was excavated at a higher level, the work proceeding at some distance in the rear of the advance of the drift-way. The tunnel is semicircular, and has a breadth of 26 feet and a height of 20 feet above the rails, the radius of the curve varying from 40 feet at the base to 18 feet in the arch. The gallery, as it was quarried out, was lined all round with massive walls of brick and cement. The heavy blocks of stone, which were blasted out with gelatine, were removed on cars in a constant rotation. On the Cheshire side, where the Beaumont borer was used, a compressed-air locomotive of Col. Beaumont's invention was employed to remove the excavated rock.

Hitherto the only connection between Liverpool and Birkenhead, where the railroads of Cheshire and Wales converge, has been by ferry. Various plans for carrying a railroad across the Mersey, by a high bridge or a tunnel, have been proposed by engineers before. The tunnel finally constructed is the shortest and most direct route, one end emerging in the center of Liverpool, and the other in the center of Birkenhead. The grades are consequently heavy. The tunnel is expected to be opened to traffic in 1885.

East River Bridge.—The suspension-bridge over the strait called the East river, which separates New York from Brooklyn, on Long Island, was completed and formally opened on May 24th. The project of a bridge to connect the two cities and furnish safe and rapid communication, was originally brought forward by William C. Kingsley, President of the Bridge Trustees, and Henry C. Murphy, his predecessor in office. Mr. Kingsley selected the site, and had plans and estimates prepared, as early as 1865. The Bridge Company was organized in 1867, with a nominal capital of \$5,000,000, the amount of the preliminary rough estimate of the engineer, \$500,000 of which was subscribed by citizens who formed the company, \$3,000,000 was to be furnished by Brooklyn and \$1,500,000 by the city of New York. In 1875 the bridge was made a State work, and placed in charge of a board of trustees. John A. Roebling, the originator of wire suspension-bridges, was the engineer. His estimates in 1867 made the cost of the bridge \$7,000,000, and of the approaches \$3,800,000. The estimated time of construction was five years. A commission of bridge engineers approved his plans. Congress passed an act in 1869 authorizing the construction, and in June of that year the Secretary of War decided that it would not impede navigation, providing

EAST RIVER BRIDGE.

five feet were added to the clear elevation proposed in the plans. This requirement, together with an increase of five feet in the breadth, added 8 per cent. to the original estimates. Other changes in the designs, which swelled the actual cost to nearly \$15,000,000, were the adoption of solid masonry for the approaches, instead of light iron trusses, and the sinking of caissons for the towers, instead of erecting them on a foundation of piles.

There were many hindrances and delays in the work of construction. In addition to the enormous and to a considerable extent unexpected technical difficulties, differences frequently occurred between the two municipalities, and occasionally appropriations were not granted in time, so that the work had to be suspended for long periods. The piers were built up by the aid of caissons of unprecedented size. The dimensions of the towers at the base are 140 by 59 feet. The New York tower was founded on the bed-rock, 78½ feet below the surface of the water. The Brooklyn tower was built up from the clay, 44½ feet below the surface. The lowering of the Brooklyn caisson began in May, 1870, and was completed in March, 1871. The New York caisson was towed into position in October, 1871, and sunk to the rock by the May following. The erection of the enormous towers was a work of time. The Brooklyn tower was finished in May, 1875, and the New York tower in July, 1876. The towers are each pierced by two archways 31½ feet wide at the height of 118 feet above high-water mark. Through these openings passes the floor of the bridge. Above the arches, which are 120½ feet high, the partitions reunite, and the towers rise 80 feet higher, to support the saddles which sustain the cables. The total height of the towers above the surface of the water is 276 feet. The height of the bridge-floor over high-water mark is 118 feet at the towers, and 135 feet in the center of the span.

The four cables are 16 inches in diameter, and contain about 5,000 single wires each. The wire is of ¼-inch size; 278 single wires were grouped into a rope and 19 ropes bunched to form a cable. The wires were carried forward and back from anchorage to anchorage over the towers. The sun, expanding the more exposed wires, and the wind, rendered the nice work of forming the ropes with mathematical exactness exceedingly difficult. The work of stringing the wires began in June, 1877, and was completed in October, 1878. On one occasion a bundle of wires broke away from the anchorage and shot across the tower, falling into the river. The iron saddles on which the cables rest are made movable, to permit of expansion and compression on a saddle-plate of iron firmly imbedded and anchored in the towers. The saddles are 18 feet long, 4 broad, and 4½ thick. They glide through minute distances in response to strains and changes of temperature, upon 40 iron rollers.

The anchorages are 930 feet from the towers on each side; they are solid masses of masonry, each 132 by 119 feet at base and top, 89 feet high, and weighing 60,000 tons.

During the construction of the bridge 20 fatal and many disabling accidents occurred. The compressed air of the caissons caused over 100 cases of caisson-disease. The victim of the first accident was Engineer Roebling, who died from lockjaw resulting from a crushed foot, received when laying the foundations of one of the shore-piers, July 22, 1869. His son, Washington A. Roebling, took charge of the work, but in 1871 he was prostrated with a peculiar form of caisson-disease which destroyed the nerves of motion, the result of a fire in the Brooklyn caisson in 1870. This fire necessitated the flooding of the caisson, and delayed the work two months. After his accident Mr. Roebling never was capable of active work. His intellectual faculties, however, were unimpaired, and he was able to make the plans and calculations, and to superintend the construction, through the mediation of his wife. It was not until 1876 that he was sufficiently restored to be removed, after which he remained in view of the bridge, directing the work, though for a long time after that he was still incapable of locomotion.

The total length of the bridge and approaches is 5,989 feet. Of this the middle span takes up 1,595 feet, the distance between the towers and the anchorages on each side 930 feet, and the approaches 1,562½ feet on the New York and 972½ feet on the Brooklyn side. The length of the suspended structure, from anchorage to anchorage, is 8,454 feet. Its total weight is 6,470 tons. The maximum load which it is designed to bear is 1,740 tons. The ultimate resistance is calculated at 49,200 tons. (For other measurements see "Annual Cyclopædia" for 1882.)

The bridge is divided into five avenues. The central one, 15½ feet in width, is the path for foot-passengers. The two outer ones, 19 feet wide, are for vehicles. The others are laid with the rails for the cars, which are drawn by an endless chain. They are attached and detached by means of a "grip" arrangement.

Niagara Cantilever Bridge.—A double-track railroad-bridge over Niagara river, about 300 feet above the railroad suspension-bridge, completed in November for the New York Central and Michigan Central Railroads, is constructed on the new cantilever principle, which is that of a balanced beam. In the perfect cantilever, represented by the bridge now building over the Forth, in Scotland, of which a description is given below, the diagonally-braced frame of the cantilever is exactly poised on the upright iron columns in the center. In the Niagara bridge, designed by C. C. Schneider and Edmund Hayes, the abutting banks are made use of to attach the shore ends to a mass of masonry which counterpoises the extra weight of the river arms, and stays and anchors the

NIAGARA CANTILEVER BRIDGE.

entire structure, and the two arms of the cantilever are different in length and in details of construction. The cantilever type of high-level bridges is a development of the use of cast-steel, which combines with rigidity a tensile elasticity that enables it to resist lateral strains to a certain degree. Like the suspension-bridge, the cantilever span can be carried over places where, as in the Niagara chasm, it is impossible to erect temporary supports. The two gigantic steel towers which bear up the cantilevers of the Niagara bridge are 132½ feet high, and rest on stone piers 39 feet high. They are composed of four columns of plates and angles riveted together, braced with horizontal struts and ties. They converge upward with a batter of 1 in 24 in the direction of the length of the bridge and 1 in 8 at right angles to the middle line of the bridge. The cantilevers are each 395 feet in length. A space of 120 feet between the river ends of the cantilevers is spanned by a girder resting on the extremities of the arms. The total length of the bridge is 910 feet between the centers of the anchorage-piers. The clear span between the towers is 470 feet. The height of the bridge is 239 feet from the surface of the river to the rail. The cantilevers are composed of two trusses, 28 feet apart, having a depth of 56 feet at the towers, 26 feet at the extremities of the river arms, and 21 feet at the shore ends. The materials used in the bridge are steel and wrought-iron, the former for the towers and the lower chords, center posts, and all the pins, and the latter for all the tension members. The steel pins connecting the members fit into the bored holes with the utmost accuracy. The lower chords and center posts are latticed channel-plates. The upper chords are heavy eye-bars. A compression member is packed between the chords of the shore arms. The shore ends of the beams are anchored to masonry abutments by short links, which serve also as expansion-joints. Joints are provided also at the connection of the intermediate span with the river ends, to allow for contraction and expansion due to changes of temperature. The floor-beams are wrought-iron plates and angles, 4 feet deep, riveted between the vertical posts. On these rest four lines of stringers, consisting of plate-girders 2½ feet deep. The width of the floor is 32 feet, a plank walk and iron railing at the side of the tracks being supported by the white-oak ties, one half of which project beyond the tracks for the purpose. Each column of the towers stands on a limestone pier, 12 feet square at the top and battering 1 in 24. The piers are connected by walls 3½ feet wide at top. The courses of the piers are 2 feet deep. The foundations are a solidified mass of bowlders, *béton*, and cement, 20 by 45 feet and 8 feet deep under each pair of piers. The anchorage-piers are 11 by 37½ feet under the coping, and consist of blocks of masonry, each measuring 460 cubic yards and weighing 1,000 tons, raised

upon 12 iron plate-girders 2½ feet deep and 86 feet long, resting in turn on 18 15-inch I-beams through which the anchorage-rods pass in such a way that the pressure is distributed evenly over the entire mass of masonry. The maximum uplifting force of the cantilevers is 678,000 pounds, or only about one third of the weight of the piers.

After the towers were built, the shore arms were constructed by the aid of temporary structures, in the usual way. After they were completed and attached to the anchorages, the river arms were built out over the river, one panel at a time, by means of huge traveling steam-derricks. When each panel was constructed and braced, the traveler was moved forward and the next panel erected. The intermediate 120-foot span was specially designed with bottom compression members so that it also could be built out from the end of each arm by the aid of temporary stays, which were removed when the two halves of the girder were fitted together in the middle.

The bridge is designed to bear a running load of a ton per lineal foot, that being one fifth of the calculated ultimate resistance, and for a wind pressure of thirty pounds per square foot on twice the exposed face of the truss, floor, and train.

Forth Railway-Bridge.—The completion of the Niagara cantilever bridge lends interest to a description of the one over the river Forth at Queens Ferry, in Scotland, which was begun in 1883. The engineers of Great Britain, to whom the development of the cantilever principle is due, have never taken kindly to the suspension principle, just as they are in general skeptical of the stability of the lighter structures which American engineers design for equal stresses. Yet, after condemning the principle for a whole generation, while the Niagara suspension-bridge stood as a practical demonstration of its soundness, at last Sir Thomas Bouch adopted the American idea in his design for the projected bridge over the Forth. The river was to be bridged by two suspension spans, with towers nearly 600 feet high, one on each bank and two on the island of Inchgarvie in the middle of the estuary. The foundations were already dug, when the Tay bridge disaster first brought to the knowledge of engineers facts relating to the intensity of wind-strains which meteorologists had already published to the world. The designs for the suspension-bridge, whose author was the designer also of the collapsed Tay structure, were discarded. Fowler and Baker, the new engineers, drew plans for a cantilever truss double-span bridge, all of steel, which will be the most stupendous structure of its kind. The material is tested for an ultimate resistance of thirty tons per square inch in tension, and thirty-four tons in compression, and the structure is planned to sustain four times the combined strain of a wind pressure of fifty-six pounds to the square foot and a maxi-

mum running load of two tons to the foot, or 8,400 tons on a span. The breadth to be spanned in the Forth is not much more than half that of the Tay at Dundee, where the new bridge, which will cost about £750,000, is making rapid progress and is expected to be finished in 1885. But the channels on the two sides of the island of Inchgarvie are about 200 feet deep, and must therefore be crossed by spanning the entire breadth of some 1,600 feet on each side. Three balanced cantilevers are sufficient to accomplish this. Two of them rest on piers erected at the edge of the channel on each side of the river, and one on the island. The cantilever has the shape of an elongated diamond. There are four masonry piers to support the four gigantic legs on which are poised the balancing arms, which extend 675 feet on each side of the base. The uprights converge upward, being 120 feet apart at the base, 33 feet at the top, where the middle point of the girder rests on the ends of the legs. The middle cantilever is longer than the other two, its base being 270 feet long, while theirs are 155 feet. The four legs are steel tubes, 12 inches in diameter and 320 feet long. The height of the bridge above the piers is 330 feet. While a lattice-girder forms the upper side of the cantilever, the under side of the enormous truss is a hollow curve, approaching in form a quadrant of a circle, drawn from the base of the legs, or struts, to the ends of the cantilever. The ends of the beams do not touch each other within 350 feet. The intermediate space is bridged by lattice-girders resting on the ends of the arms. On the shore sides of the outside cantilevers the weight of these girders is counterpoised by an equal weight of metal. The bridge will present the appearance of two distended arches and a half-arch at each end. The shore sections will consist of girders resting on stone piers. There will be eight piers within high-water mark and two on land, on the south side, and six on the north side, all on land.

Garabit Viaduct.—A bridge, begun in 1881 and to be finished in 1884, which is intended to carry a railroad over a river at Garabit,

GARABIT VIADUCT.

France, is even loftier than the lately completed Kinzua bridge in Pennsylvania. The French viaduct has a great arch in the center. The height from the bed of the river to the rail is 413 feet, while in the Kinzua valley viaduct the level of the rail is 301 feet above the stream-bed. In length the French structure is 1,880 feet, or 171 feet less than the other.

American Transcontinental Railroads.—The completion of the Northern Pacific railroad in October gives the United States three or properly four great transcontinental lines, while two more are far advanced in construction. The Atchison, Topeka, and Santa Fé, the last link of which was finished two months before the Northern Pacific, is the fourth to reach completion. The Northern Pacific has its eastern terminus at Duluth, where it connects with land and water routes to the seaboard. The road has recently been extended eastward to Superior City, with the intention of ultimately crossing the Sault Ste. Marie and finding an outlet on the seaboard by one of the new trunk lines. The western terminus and the difficult section across the Cascade range were changed from the original plan, owing to the combination under the Villard management with the Oregon company. Instead of terminating at Puget Sound, the Pacific section follows Columbia river down to Portland. The first of the transcontinental lines that was built was the Union Pacific from Omaha to Ogden, continued by the Central Pacific, to San Francisco. This road was chartered in 1863 and completed in 1869. The Southern Pacific, in connection with the Texas and Pacific, forms a third transcontinental route. The eastern terminus of the Southern Pacific railroad is at Galveston, and that of the Texas and Pacific at New Orleans. The Southern Pacific railroad has recently supplied the link which gives it a northern terminus at Vicksburg in the direction of its natural ocean outlet at Savannah. It approaches the Pacific ocean near San Diego, which is its natural terminus, but it is now carried up through California to San Francisco. The Atlantic and Pacific, called sometimes the

thirty-fifth parallel road (as the last mentioned is called the thirty-second parallel route), terminates through its continuation, the St. Louis and San Francisco road, at St. Louis. It emerges on the Pacific coast at the same place as the Southern Pacific, and uses its prolongation up the coast to meet the ocean commerce at San Francisco. The Atchison, Topeka, and Santa Fé, which line was completed in 1883, forms with the Sonora railroad, lately acquired

by purchase, running southward through Mexico to Guaymas, on the Gulf of California, a fifth transcontinental line, connecting with the Eastern railroads at Kansas City. The Canadian Pacific is rapidly approaching completion. South of the United States there are, besides the Panama railroad, three Mexican interoceanic lines chartered and partly constructed. The most northerly crosses Tampico to San Blas and is called the Mexican Central. The Mexican National railroad crosses from Vera Cruz, by way of the city of Mexico, to Manzanillo. The third is the line across the Isthmus of Tehuantepec, which was begun with the aid of subsidies by an American company, but became forfeit by lapse of the term stipulated for completion, and was confiscated and carried on by the Mexican Government.

The southern route for a Pacific railway now followed by the Southern Pacific, the Atchison, Topeka, and Santa Fé, and the new Atlantic and Pacific lines, was proposed when the project of a transcontinental railway was first under discussion, but was rejected by Congress. It has the advantage of avoiding the elevations north of Colorado and in the Nevada plateau. The Northern Pacific, where it crosses the Rocky mountains, is a remarkable example of railroad engineering. There is a gradual ascent on the western side through a magnificent forest-region to Clark's Fork. At Missoula, in this valley, it assumes the character of a mountain railway, which is preserved up to the point where it emerges in the valley of the Yellowstone. It crosses the summit range, the Cascades, at Mullen Pass, through a tunnel nearly 4,000 feet in length, at an elevation of 6,560 feet. The descent on the opposite slope is by moderate gradients through the valleys of the head-waters of the Missouri, the Jefferson, the Madison, the East and West Gallatin, and finally the Yellowstone, which it leaves at Glendive.

The construction of a transcontinental railroad across South America is an engineering problem the conditions of which are entirely different from those of the North American routes. Henry Meiggs, when building in Peru his first Andes railroad, till then the most magnificent mountain railway in the world, which ascends to altitudes as great as Mont Blanc, in which the barometric pressure is only 400 millimetres, and fire will scarcely burn, intended it as a link in a railroad across the continent. This work of genius was thrown into the shade by his Lima-Oroya railroad, which ascends on each side through 44 tunnels and over dizzy viaducts, to the summit-level in the Cima-Jalexa tunnel, 1,860 metres long and 4,769 metres above the level of the sea. The project of a transcontinental railway was not only premature, but the location of the route by Meiggs was through countries which, though possessing unlimited natural resources, were socially backward. An interoceanic road between the more progressive states of Chili and the Ar-

gentine Republic is much more feasible as a work of engineering, and commercially more promising. The project was under consideration at the time when Meiggs carried out his stupendous works. A convention between the two governments has been in existence many years, but they do not seem to desire such close commercial communication. The distance between the two capitals in a direct line is only 375 miles. The dangers from water and an exuberant vegetation, which are found in the Brazilian route, are here absent. There was no known practicable pass in the Andes, but no technical examination of the mountains had yet been made. Lately a gap in the chain has been discovered farther south, in Northern Patagonia, which would afford an easy passage.

EPIDEMIC DISEASES IN 1888. With the exception of cholera and yellow fever, there has been no wide-spread epidemic of disease during the year; but these have been manifested with their usual virulence and activity. Europe and the United States escaped an epidemic, but Egypt suffered almost as much from the devastations of cholera as from the effects of her civil war, and certain towns in Mexico were almost depopulated by yellow fever and the resulting panic. Concerning the cholera in Egypt, it is officially stated that the deaths from the disease were in excess of 48,000, and probably reached 50,000. This epidemic first appeared at Damietta, on the 24th of June, 1888. The city itself had a population of about 82,000. On the 27th of June cholera was reported from Port Said, and on the 30th of June at Samanoud, but it was not until the 15th of July that the disease reached Cairo. A great panic prevailed throughout Egypt, and on the earliest report of the existence of cholera at Damietta, the people fled in great numbers; a majority of them departing for Turkey. The Porte required all refugees from Egypt to undergo quarantine, either at Beirut or Bourla at the entrance of the Bay of Smyrna. Consul-General Heap reported to the State Department from Constantinople, on the 21st of July, that "the limited accommodations at both places were enlarged by the erection of temporary wooden barracks and tents, but the panic-stricken refugees from Alexandria came in such numbers that these structures soon became insufficient to accommodate such crowds, and as each day brought fresh arrivals, the sufferings of these people from exposure to the burning sun and the chilling night dews became very great, and threatened to create the very evil it was the intention to guard against. Those arriving at Beirut were the greatest sufferers, and the Turkish authorities were finally compelled to telegraph to Alexandria, to give warning that no more refugees could be received, or would be allowed to land."

Sanitary cordons were established in a somewhat desultory manner by the local authorities of each place, from time to time, and such as

were thought necessary were finally made effective by the British Government. Many of the cordons had been established to protect places which were either infected at the time or subsequently became infected, were then abolished, they being no longer of any use, and the British Government directed the enforcement of sanitary measures by the troops then in Egypt.

The following extract from a report to the State Department, by United States Consul-General G. P. Pomeroy, stationed at Cairo, under date of August 16th, will show the energetic measures adopted:

At a recent interview with Surgeon-General Hunter, who was sent to Egypt by the English Foreign Office as medical adviser to the Egyptian Government, I learned a few facts, which I will here recount. This gentleman, with medical assistants, has just returned to Cairo from a tour of inspection of the infected districts in Lower Egypt, of which the most important towns are Damietta, Mansourah, Samanoud, Zagazig, Kafr-Zayat, Mahala-Kybir, Tanta, and Benha. Surgeon-General Hunter remarked that, with the aid of Sir Edward Malet, he communicated to the Minister of the Interior a decided wish to see promptly executed in Cairo, and throughout all the infected districts, the cleaning of the mosques, streets, and cemeteries, of filth and foul matter, to bury the corpses at least one metre under the ground, to cover them with quicklime, and to destroy by fire the small houses tainted with the malady, and the pestilential or noxious air by which it is produced. In this matter, it is necessary to state, the Arab people all through the country here, from a religious impulse, have offered a considerable opposition, which was fortunately silenced by naming, as delegates for executing these measures, notables, Arab doctors, and employes of the different government local administrations. Surgeon-General Hunter also informed me that the English Government, with acquiescence of the Egyptian native authorities, has concluded to form here, as in India, a permanent Sanitary Commission, which will be composed, in the beginning, of eight officers and forty assistants, belonging to the Indian Medical Board (intendancy), who are experienced in the study and practice of this disease, and who will have complete charge and management, in this land, of all public sanitary measures.

Consul-General Pomeroy expressed his opinion that the chief cause of the "present" cessation of cholera in Cairo, and some other towns, is to be attributed "to the very high rise of the Nile, which has very lately filled with fresh water the canals of the infected districts, and thereby cleaned out the poisonous matter and filth which was the direct origin of the development of cholera. Apart from the cholera epidemic, there is at present a great deal of typhoid fever in the country, and we have just got over an epidemic of spotted typhus fever."

While the epidemic lasted, great alarm was felt in Europe, not only among the countries bordering on the Mediterranean, but in Russia, which quarantined her Black sea ports, and later those in the Baltic, and all Europe quarantined against arrivals of persons and goods from Egypt, in view of the danger of importation of cholera. England departed from her usual conservatism against quarantine, by laying the responsibility upon customs officers to make special investigation of the importation

of cargoes from Egypt and of passengers; and it is probable that the failure of the cholera to spread to Europe is due, first, to the early quarantine measures instituted against it, and, second, to the energetic policy of the British Government when it was discovered that the Egyptians were either powerless or incompetent to institute proper sanitary measures themselves. Owing to the large quantities of rags annually exported from Egypt to the United States by way of England, it was felt by our Government that great danger existed in the unrestricted importation of infected rags, and sanitary inspectors were appointed in Liverpool and London, to inspect the cargoes of vessels departing for the United States, and to give notification by telegraph of the departure of infected goods. Collectors of customs were forbidden to allow the entry of Egyptian rags until the municipal health officer of the port where the entry was to be made should give a certificate that in his opinion no danger need be apprehended from so doing. This almost stopped the importation of Egyptian rags for some months, and steamships declined to receive suspected rags as freight. It is now proposed that American shippers of rags shall have them properly disinfected before shipment, and to that end a sanitary inspector, acting under the direction of the United States consul, has been appointed, and stationed at Alexandria, whose duty it is to see that the rags have been thoroughly boiled before baling. Machinery on a large scale has been shipped to Alexandria by one of the principal paper-manufacturing firms of the United States, whereby the boiling and subsequent drying may be accomplished with but little loss of time. From a scientific point of view, the cholera epidemic in Egypt does not appear to have afforded any permanent lesson. The early cordons were too inefficiently conducted to be of material service in settling the question as to the prevention of its spread, and the several commissions sent by France and Germany respectively do not appear to have conclusively settled the causation of the disease. The German Commission, headed by Prof. Koch, announced the discovery of a microbe and bacillus, found principally in the walls of the lower intestines. The French Commission was nominally headed by Prof. Pasteur, but was really headed by M. Thuillier, who died at Alexandria, a martyr to his scientific zeal. This commission reported that a micro-organism was found in the blood, located in the spaces between the blood-globules. Further experiments are necessary in order to demonstrate the truth of these propositions. In the mean time nothing has been discovered which in any way modifies the treatment of previous years. The "Fyvers' treatment," which consists in the administration of emetics and purgatives, has again been brought forward. This treatment, it will be remembered, originated in Mauritius in 1856.

A commission was appointed by the German

Government in 1878 for the purpose of investigating the causes of cholera, and their report was made early in 1883. Prof. Hirsch, of the commission, announced his adherence to the doctrine that "from the cholera-patient an infectious substance is actually thrown off, which, however, is not yet capable of acting directly as a cholera-poison, but only obtains its specific infecting influence after it has undergone a certain change, outside the system of the patient himself, and under the aforementioned external circumstances, either upon or in the soil or a *succedaneum* of the soil."

Prof. Pettenkofer announced as his opinion, that "the reproduction of the cholera-poison takes place quite independently of the cholera-stricken individual (as such), seeing that it may attach itself to persons, sick or well, or to other objects, through the instrumentality of which it may be carried from place to place, and wherever it finds appropriate conditions for its reproduction it may light up an epidemic." The recommendations of this commission for the prevention of the disease are as follow:

Of all the measures which may be applied to the prevention and combating of cholera, those take the first place which have for their aim the improvement of general sanitary conditions; all specific measures against cholera will prove unavailing unless we pay the strictest attention in inhabited places to the purifying of the soil from organic and easily putrefying refuse, to the drainage of the soil, to the constant flushing of the sewers, to the frequent emptying of cess-pits, to the careful inspection of dwellings and closing those that are really hurtful, the provision of pure water both for drinking and other domestic purposes, and the like.

Yellow fever prevailed during the year in its native home on the island of Cuba; on the Mexican shores of the Gulf; in a less degree in Brazil, and to a very serious extent on the western shores of Mexico. There is always danger to the Gulf-ports of the United States from the admission of yellow fever from Havana, Cuba, and from Rio de Janeiro, but this year it was threatened from a city where the shipping has hitherto been measurably exempt—Vera Cruz, Mexico. No other city on the Gulf-coast of Mexico suffered severely from yellow fever, but on the west coast the disease appeared with unusual virulence.

Vera Cruz, like Havana, has cases of yellow fever the year round. The following table of mortality from yellow fever, at the Hospital de Sebastian, was compiled by Assistant Surgeon Guitéras, of the Marine-Hospital Service:

PATIENTS.	1875.	1876.	1877.	1878.	1879.	1880.	1881.	1882.	Up to Feb. 14, 1883.	Total.

Speaking of the endemic character of the yellow fever at Vera Cruz, a local tradition has it (Padre Alegre) that yellow fever was introduced there in 1699, by an English ship, which arrived with a cargo of negro slaves from the west coast of Africa; but there does not appear to be much contemporaneous historical evidence to support the tradition. Yellow fever appeared on the west coast of Mexico, principally in the cities on the coast bordering on the Gulf of California. The disease appeared at Mazatlan early in September, and is now believed to have been introduced by a vessel from Panama. It spread rapidly to Guaymas, Hermosillo, and Manzanillo. The city of Acapulco inaugurated a rigid quarantine against vessels from the other western coast ports, and escaped the infection. La Paz, in Lower California, Mexico, was also infected with the fever, which reached the highest pitch of malignancy in September, and deaths in that town reached 114. The acting United States consul at La Paz, Mr. Viosca, was himself affected with the disease, as was also Mr. Willard, United States consul at Guaymas. Mr. Willard estimates that only about 200 persons died at Guaymas of yellow fever, out of 8,500 attacked. He estimated that in the capital of the State (Hermosillo), over 2,000 persons were sick from the disease at one time. The effect of this scourge on those towns was to paralyze all business and create a general panic in the interior. As usual, on its first appearance, there was much discrepancy of opinion as to whether the disease was really yellow fever, or simply the ordinary coast bilious fever; but as the epidemic progressed, it became impossible either to conceal the fact that yellow fever was present, or to deny it so effectually as to prevent adjacent towns from quarantining against them. The American steamer Newbern, which left Guaymas on the 19th of September, arrived in San Francisco on the 29th, with five of her crew sick with yellow fever. Fortunately, the disease was not communicated to the city. The United States Government took early precautions against the admission of yellow fever by keeping inspectors at Havana and Vera Cruz to report by telegraph the departure of infected ships. Inspectors were stationed in Arizona at Fort Yuma and Benson, to prevent the entrance of persons sick with yellow fever, or of infected baggage from the Mexican cities. An inspector was also stationed at Brownsville, Texas, for the same purpose. The Government maintained a quarantine at Ship Island, in the Gulf of Mexico; a quarantine at Pensacola; Sapelo Sound, on the Atlantic coast, and near Cape Charles in Chesapeake Bay. The local authorities of the United States ports maintained their quarantines as usual. The Revenue Cutter Service was instructed to patrol the Gulf-coast for the purpose of inspecting vessels, and to forbid the entrance into any port of persons infected, or of vessels having infected cargoes, and to order

them directly to quarantine. These energetic measures prevented the entrance of yellow fever into any port of the United States. As in the previous year, all matters of quarantine administration were managed by the Marine-Hospital Service, a Bureau of the Treasury Department, of which the Surgeon-General is the chief officer, who is responsible to the Secretary of the Treasury. On the 16th of August a local outbreak of the disease occurred in the Pensacola navy-yard, and the outlying villages of Warrington and Woolsey on the naval reservation, the origin of which is still in doubt. The Secretary of the Navy ordered a board of inquiry to ascertain the cause of the fever, and they reported as the probable cause that infected ballast was used in building the jetties at Fort McRae, workmen on which lived in the village of Warrington, and went immediately from the jetties to their homes. The board, however, declined to give any positive opinion, but simply regarded it as probable that this was the source of infection. Other causes of infection are enumerated and given as possible, among them the possibility of the hibernation of the germs in infected goods left over from the previous year's epidemic in the city of Pensacola.

A sanitary cordon was early established against the naval reservation, which prevented travel to or from the reservation during the prevalence of the epidemic. The efficacy of an efficient *cordon sanitaire* was once more demonstrated, for no case of the disease appeared outside the limits of the reservation. There were a few separate cases of yellow fever in the city of Pensacola, evidently developed from infected bedding left over from the previous year, when a serious epidemic prevailed.

As to the causation of yellow fever in general, nothing has been developed within the year, except the investigation of Dr. Domingos Freize, of Brazil, who reports having discovered the microbion of the disease; that it is developed in the corpses of the deceased; and that it flourishes to a great extent in the earth of cemeteries. Dr. Freize has recognized in the blood of yellow-fever patients the *cryptococcus*, to which he has attached the name of *xanthogenicus*. The color of the black-vomit he considers due to this cryptococcus. He has produced the disease in Guinea-pigs and rabbits by injecting the *C. xanthogenicus*. He advises, as the best means of extermination, the building of public crematories, and that all persons dying of yellow fever shall be cremated. The Brazilian Government has approved his recommendation, and a crematory has been erected by order of the Imperial Government.

Dr. Carmona Del Valle, of Mexico, also claims to have discovered the germ of the disease, and has named it *Peronospera lutea*. He finds its mycelium in the black-vomit, and claims to have observed its development in the urine.

ERYSIPELAS. See SURGERY.

EVANGELICAL ASSOCIATION. The statistical reports presented to the General Conference of the Evangelical Association, at its meeting in October, 1888, gave the following items: Whole number of members, 120,231; increase during four years, 10,458; number of preachers, 1,671; of churches, 1,622, of which the value was \$3,577,888; number of parsonages, 501, having a value of \$307,205; number of Sunday-schools, 2,181, with 185,795 pupils.

General Conference.—The General Conference met at Allentown, Pa., October 4th. An account of the present condition of the Church, and a review of its progress during the past four years, were given in the address of the bishop. The net gain in members had been about 8 per cent., or 5 per cent. less than the gain during the preceding four years, and 12 per cent. less than the gain during the four years from 1871 to 1875. The gain in the number of ministers (itinerant and local) had been about 8 per cent., the increase in the number of churches a little more than 8 per cent., and that in the number of Sunday-schools about 9 per cent. Much improvement was remarked in the substitution of new church-buildings for old ones; and debts resting against churches had been paid off to such an extent that all the churches in some of the conferences were free from such debts, and nearly all the others were in an easy condition. The receipts of the Missionary Society during four years had been \$384,086, or \$103,404 more than those of the previous four years. The work of home missions had been extended to Texas, where missions had been organized in Galveston, San Antonio, and Temple, and to Denver, Col. The receipts of the Publishing House at Cleveland, O., during four years, had been \$767,007, or \$169,097 more than those of the previous four years; and those of the Publishing House in Stuttgart, Germany, had been \$64,859. The Missionary Society employed 420 missionaries and supplied 427 mission charges, with which were connected 85,767 members; it also sustained 775 mission Sunday-schools, with 6,910 officers and teachers and 47,280 pupils. Abroad the society sustained missions in Europe, in aid of the conferences in Germany and Switzerland, and in Japan. The two European conferences employed 67 preachers besides theological students, and included fifty stations with about 700 preaching appointments, and an enrollment of 8,400 members, and 268 Sunday-schools, with 16,950 pupils. Three periodicals were published at Stuttgart. The net increase in members in Europe was small, though the additions to the churches had been many, because a large proportion of the converts had emigrated to the United States. The German churches had suffered much from the opposition of the state churches. The mission in Japan returned 2 American preachers, 4 American woman missionaries, 8 native preachers, 4 student helpers, 3 native Bible-

women, a number of teachers in day-schools, 8 day-schools with 132 pupils, and 4 Sunday-schools, with 191. The Committee on High Schools and Education reported on the condition of Northwestern College, Naperville, Ill.; the Biblical Institute; Union Seminary for young men and young women (with which a theological course is connected); Schuylkill Seminary, Reading, Pa., a new institution; and the Theological Seminary at Reutlingen, Germany, where nineteen young men had received instruction during the quadrennium. The attention of the conference was largely given to matters of detail in discipline and the management of the business affairs and benevolent enterprises of the Church. A report expressing the sentiments of the body on various questions of public morals recommended the legal prohibition of the traffic in intoxicating liquors; advised a strict observance of the sanctity of the Christian Sabbath; and condemned loose divorce legislation and speculations in stock and produce. The speedy publication of a series of normal class textbooks, and the formation of classes for the regular study of a course of instruction covered by them, with certificates of graduation to be given to those who complete the same, were recommended. Provision was made for the formation of a woman's missionary society auxiliary to the Missionary Society of the Church, for the organization of local branches to co-operate with it.

EVENTS OF 1883. The year 1883 was comparatively devoid of striking political events, but with peace assured in Europe it was a year of legislative discussion and activity. The popular unrest in Europe, heightened by the growing acuteness of the economical struggle for life, manifested itself in characteristic ways. The same circumstances impelled governments to make commercial restrictions, and, in conjunction with the absence of military dangers at home, to seek acquisitions in the outlying regions of the earth. There were constitutional struggles and revolutionary attempts in many lands, revealing the instability of their political institutions. There was a more abundant harvest in most countries. The year was chiefly remarkable for extraordinary natural calamities. A volcanic outburst devastated one of the most populous and productive regions of the world, the cholera mowed down the population of another, earthquakes demolished whole towns, freshets ravaged the valleys of Central Europe, and tornadoes spread desolation in the United States. The minor catastrophes and accidents by land and sea, when aggregated, present an appalling sum of destruction, suffering, and death. The following chronicle recounts the noteworthy events of 1883 in the order of their occurrence:

January 1. Inauguration of Governor Cleveland at Albany. Floods at Vienna and on the Rhine; 500 houses destroyed at Worms.

2. Meeting of New York Legislature. Inundations

extend in the valley of the Rhine and its tributaries, causing great damage and suffering at Düsseldorf, Mayence, Worms, Mannheim, and Ludwigshaven.

3. Railroad communications between Switzerland, France, and Italy, interrupted by high water. Plot against the Austrian Crown Prince discovered at Pesth.

4. Sherman's bonded whisky bill passed in the Senate. House of Representatives pass Pendleton's civil-service reform bill. Presburg, in Hungary, flooded. Spanish Minister of Finance declares the necessity of retrenchment.

5. State Treasurer of Tennessee absconds, leaving defalcations to the amount of over \$400,000. Rhine floods recede. Death of Gen. Chanzy.

6. Funeral of Gambetta, at Paris, amid manifestations of public sorrow.

7. Spanish Cabinet resigns. Sinking of the steamer City of Brussels, run into in a fog by the Kirby Hall, near Liverpool.

8. Sagasta forms a new Ministry in Spain.

9. Presidential succession bill passed in Congress. English ship British Empire burned on the high seas. German Emperor subscribes 600,000 marks for the Rhine sufferers. The Opposition attack the Government on the question of prohibiting American pork. Spanish Ministry formed under the presidency of Sagasta.

10. Burning of the Newhall House in Milwaukee; nearly 100 lives lost. Prussian Diet votes 3,000,000 marks for the relief of the inundated. Flood devastates the town of Raab, in Hungary; many persons drowned.

11. Bill to restore Gen. Fitz-John Porter to his rank in the army, without back pay, carried in the Senate. Death of ex-Senator Lott M. Morrill, in Augusta, Me. Historic triumph of Edwin Booth at Berlin. German Reichstag rejects a motion to repeal the anti-Socialist laws, the May laws, and all exceptional legislation.

12. Shipping bill, with drawback and free-ship clauses struck out, passed by the House of Representatives. Arrest of Phoenix Park murderers in Dublin. The Czar and imperial family take up their residence in St. Petersburg in the Anitohkoff Palace.

13. Fire in a circus in Berdichev, Russian Poland; 300 persons burned to death.

14. Arrest of Prince Napoleon in Paris for issuing a manifesto. The British ship *Pride of the Ocean* destroyed by dynamite.

15. Floquet proposal to expel members of royal families voted urgent in the French Chamber. Termination of Portuguese treaty with England relating to the west coast of Africa.

16. Execution of two agrarian murderers in Ireland. Swedish Parliament opened.

17. Prohibition amendment in Iowa adjudged invalid. Vote of thanks in the Reichstag for American subscriptions to relief fund. The village of Marais in Savoy destroyed by an earthquake.

18. Disaster on Southern Pacific railway near Tehichipa, Cal.; 15 lives lost. Sinking of the Hamburg steamer *Cimbria*; 353 drowned out of 420 on board. The Russian city Kherson destroyed by fire.

19. Gen. Iglesias proclaimed President in Peru by a Congress sitting at Catamarca, and accepts on condition that the people are willing to make peace with Chili. Skuptshina (of Servia) approve German commercial treaty.

20. Explosion of giant powder near Oakland, Cal., killing over 80 Chinamen. Explosion of a gasometer in Glasgow. Death of Prince Frederick Charles Alexander of Prussia.

21. A clause of the Ku-klux law of 1871 decided to be unconstitutional. Arrest in Germany of the officers of the English steamer *Sultan*, which collided with and sank the *Cimbria*. The insurgents in Ecuador gain a victory.

22. John E. Kenna elected Senator for West Virginia, and Richard Coke for Texas. A number of

deaths from starvation in Ireland. Belgian Chamber sanctions the introduction of the Flemish language in the intermediate schools of Flanders. Closure of Servian Skuptchina. Death of Gustave Doré.

24. Senatorial elections in New Jersey and Kansas, return of McPherson and Plumb. In New Guinea 16 sailors are slaughtered by cannibals.

25. Audience of the Russian minister De Giers with the Austrian Emperor. Naval appropriation bill passed in the House.

26. Embezzlements in the Municipal Gas-Works of Philadelphia discovered.

27. Bowen and Tabor elected to represent Colorado in the Senate. New York State Senate confirms the Governor's appointments of Railroad Commissioners. The German bark Admiral Prince Adalbert wrecked off the coast of Wales.

28. The French Cabinet resigns. Mutiny of convicts in Cork Harbor. Hungarian Chamber rejects a proposition to repeal the emancipation of the Jews.

29. French Ministry newly organized with Fallières for Premier. Wrecks on the English coast. Duration of International Tribunals in Egypt prolonged till Feb. 1, 1884.

30. Fatal snow-slide in Colorado. Switzerland rejects the naturalization treaty proposed by the United States.

31. Gen. Manderson elected Senator for Nebraska. Strike of 8,500 workmen in Limoges, France. Gen. Thibaudin appointed French Minister of War. Restoration of King Cetewayo in Zululand.

February 1. Election of D. M. Sabin to the United States Senate in Minnesota.

2. Resolution in favor of the preservation of forests adopted by New York Legislature. French Chamber passes the expulsion bill against royal families. Steamer Kenmare Castle foundered in the Bay of Biscay.

3. Inundations in Pennsylvania, Ohio, and Indiana.

4. Severe earthquake at Agram. Spanish Cortes refuse to abolish parliamentary oaths.

5. Colvin nominated Financial Adviser to the Egyptian Government.

7. Arrest of Payne, organizer of the Oklahoma raids.

8. The Spanish Government emancipate 40,000 slaves in Cuba. Opening of Danube Conference at London.

9. Death of William E. Dodge. Government proposal of biennial budgets rejected by the German Reichstag.

10. Death of Marshall Jewell.

11. Breaking of a dam in Louisville, and destruction of life and property.

12. Prince Jerome Napoleon released from confinement. Coronation of King Kalakaua in Honolulu.

13. Minister Fallières proffers the resignation of the French interim ministry. Death of Richard Wagner.

14. Death of E. D. Morgan.

15. British Parliament meets. French Chamber adopts the pretenders' bill of Barbey.

16. Bill to return Japanese indemnity passed by the Senate. The New York Legislature passes the tenement-house cigar bill, and the bill to reduce elevated-railroad fares. A mining accident in Illinois causes the loss of 80 lives. Ukase of the Czar on amending laws relating to the Jews.

17. The Legislature of Pennsylvania rejects the prohibition amendment. The Jeannette investigation ends in the adoption of a report approving the conduct of all members of the expedition. Carey appears as a witness for the crown in the Dublin criminal investigation. French Senate rejects the expulsion bill. Norwegian Storting meets.

18. The tariff bill passed by the United States Senate. Adverse vote on the measure in the House of Representatives. Appointment by the President of the Civil-Service Commission. President Grévy accepts the resignation of the Cabinet, and charges Jules Ferry with the formation of a Ministry.

20. Panic in a German Catholic school in New York; 15 children killed. Count Corti demands of the Porte satisfaction for insults to Italian consul in Tripoli, under threat of naval action.

21. Army appropriation bill passes the Senate. Burning of the steamer Morro Castle in Charleston Harbor. Loss of United States steamer Ashuelot; 11 drowned. The German Federal Council adopt the resolution prohibiting the importation of American pork. New French Cabinet constituted by Ferry.

23. Mutiny of prisoners, and burning of the Penitentiary in Jefferson City, Mo. Prof. Swift, of Rochester, N. Y., discovers a new comet.

24. The Senate adopts revenue bill intended to reduce customs and taxes \$25,000,000. John W. Foster, of Indiana, appointed Minister to Spain. Escape of 20 prisoners from the Arkansas State Prison. Decree of Servian King on new organization of the army.

25. The Orleans princes in the French army are retired from active service.

26. Bankruptcy of a Roman Catholic church in Lawrence, Mass., and loss of trust-funds.

27. Senate bill of revenue reform referred by the House of Representatives to a commission. Bill against the adulteration of teas passed in Congress.

28. The Secretary of State informs the Senate that the Government disapproves the attitude taken at Lima by Mr. Partridge, in joining the representatives of England, France, and Italy in a friendly intervention between Chili and Peru. Silver wedding of the German Crown Prince. Edhem Pasha appointed Turkish Minister of the Interior.

March 1. Belgian Chamber refuses to cut down the bishops' salaries. Decree of resumption of specie payments signed by King of Italy. Resignation of Dutch Ministry.

2. Veto of the five-cent elevated railroad fare bill by Governor Cleveland.

3. Retirement of David Davis from the presidency of the Senate; Senator Edmunds chosen his successor. Passage of the tariff act. Senate tables river and harbor appropriation bill.

4. Tariff act signed by the President. Adjournment of Congress. Steamboat Yazoo sunk in the Mississippi, and 16 lives lost. Death of Governor A. H. Stephens at Atlanta.

5. Decision by the United States Supreme Court that a State can not be sued by another State for claims assigned to it by citizens. James S. Boynton, President of the Georgia State Senate, sworn in as Governor in the place of Alexander H. Stephens, deceased. Resignation of the Prussian Minister of War, Von Kameke.

6. Revision of the Constitution negatived by the French Chamber. Gale on British coast, 135 fishermen lost.

7. Coalition of Democrats and Greenbackers in Michigan declare for free trade. Bronsard von Schellendorf appointed Prussian Minister of War.

8. Retirement of the German Naval Minister, Von Stosch.

9. Louise Michel leads a demonstration of unemployed working-men in Paris, and instigates a bread riot. The steamer Navarre, sailing between Copenhagen and Leith, goes down with 65 persons on board. In Andalusia 1,200 persons are arrested on the charge of conspiracy as members of the Black Hand Association.

10. Danube Convention signed in London. Death of Coumoundouros, Greek ex-Minister.

11. Death of Prince Gortchakoff.

12. Turkish Government gives notice of termination of treaties of commerce with the United States, Belgium, Netherlands, Spain, Sweden, and Denmark.

14. The murderer Dukes acquitted by a jury in Uniontown, Pa. Parnell's amendment to the land act rejected by the British Parliament. Discovery in St. Petersburg of defalcations by officials amounting to 11,000,000 rubles.

15. Affray in the Pennsylvania Legislature. Dynamite explosion in the Government Buildings in London. Servian Ministry resign; reconstituted under the presidency of Soboleff. Swiss commercial treaty with Spain signed.
16. Adjournment of the Austrian Reichsrath. Death of Carl Marx.
17. Arrests of citizens of South Carolina by revenue officers.
18. The repudiation act goes into force in Tennessee.
19. Sitting Bull located in the Standing Rock Reservation. Conviction of three Socialists charged with robbery in Vienna.
20. Death of Sir George Jessel, Master of the Rolls.
21. In Armagh, Ireland, 19 persons found guilty of conspiracy to murder.
22. Death at Kenosha, Wis., of Postmaster-General T. O. Howe.
23. Destruction of the village of St. Anton, in Tyrol, by a conflagration.
24. The Washington Grand Jury finds indictments against Brady and ex-Senator Kellogg. Strike of tobacco operatives in Lynchburg, Va. Death of John Brown, the Queen's gillie.
25. Count Majlath von Szechely, Hungarian judge, murdered in Ofen. French take possession of Porta Negra and Loango on the Congo; protest of Portuguese naval officers.
26. Terrific storm on the coast of England. Louise Michel gives herself up to the Paris police.
27. Loss of 53 lives by a railroad accident on the Cincinnati Southern Railroad, near Mason's Station, in Ohio. Arrest of 40 Socialists in Spain.
28. A band of Nihilists broken up in St. Petersburg. Albanians attacked and killed by Montenegrins.
- April 2. Democratic success in the St. Louis municipal elections.
3. The President appoints United States Judge Gresham, of Indiana, Postmaster-General. Illinois Democratic State ticket adopted in Chicago. Arrest of the Socialist deputies, Vollmar and Frohne, at Kiel, Germany, on their return from a Socialist Congress in Copenhagen.
4. Death of Peter Cooper in New York. Success of the Republicans in Rhode Island; defeat of Sprague. The Ohio Legislature adopts two temperance amendments. First public announcement of the triple alliance.
5. Discovery of a dynamite factory in Birmingham, England, and arrest of several conspirators. Powder factory near Rome explodes, killing 40 persons.
6. Hotel in Greenville, Texas, falls in, killing 13 people.
7. Death of Louis Veuillot.
8. Beginning of the trial of the Phoenix Park assassins in Dublin. Explosives bill enacted by British Parliament.
9. Prairie-fire in Nebraska. Strike of 7,000 dock laborers in Marseilles, France.
10. Labor-strikes in Reading and Boston. Healy's scheme for local self-government in Ireland rejected by the House of Commons.
11. The Left in the Danish Folkething propose an address to the King, expressing want of confidence in the Ministry.
12. Cigar-makers win a strike in Cincinnati.
13. Queensland Government proclaims the annexation of New Guinea. Swiss Federal Council remove decree expelling Bishop Mermillod. Rescript of the German Emperor on social reform and biennial budgets. Arrest of 2,000 persons in Moscow. Tisza's answer in the Hungarian Parliament on the subject of the triple alliance. Danish Folkething pass the vote of censure.
14. Danish Landsting pass a vote of confidence in the Ministry.
15. Charges brought against the Government Supervising Architect Hill. The Scott liquor law goes into operation in Ohio. House of Commons postpone local tax reform until the consideration of the whole subject of local government.
16. Illinois adopts the license system. Gov. Butler, of Massachusetts, publishes charges against the administration of the Tewkesbury poor-house. Visit of the Prince of Bulgaria to the Sultan. The King of Denmark accepts the addresses of both Chambers and reproves the Folkething for not passing ministerial measures.
17. Summing up in the Star Route trial. Grants to Lords Wolseley and Alcester voted by British Commons. Conviction of 19 Nihilists at St. Petersburg.
18. Act relating to the reorganization of the Emigration Department goes into force. Conflagration in Delhi, India; 2,000 buildings burned.
19. Final decision against the validity of the Iowa prohibition amendment.
20. Tornado in Mississippi; 50 dead and 300 injured. Executions and arrests in St. Petersburg. Dutch Ministry finally formed by Heems Kerks.
21. Henry D. McDaniel elected Governor of Georgia. Tornadoes in Louisiana and Texas. Strike of Berlin cab-drivers. French Chamber adopt the measure to convert the rentes from 5 per cent. into 4 per cent. bonds. Proposition to impeach the Ministry thrown out by Norwegian Odelsting.
22. Ship British Commerce wrecked off Owner's Light-house. Mine-explosion in Besseges, France; over 100 lives lost.
23. Organization of the Irish National League of America.
24. Austrian Chamber of Deputies passes the school act.
25. Victory of Egyptian troops over followers of the False Prophet. Riot between Arabs and Greeks at Port Said.
26. Prohibition of American pork in Greece. Nomination of 12 Polish bishops by the Pope.
- May 1. Opening of the Colonial Exhibition in Amsterdam. Duc de Broglie's interpellation on the triple alliance.
2. Burning of a steamer on the coast of British Columbia; 70 lives lost. Conviction of the Phoenix Park murderers Caffry and Delaney.
3. Trial of twenty-six Socialists in Lemberg. Parliamentary oaths bill defeated in the House of Commons. Bradlaugh tries again to take his seat. Steamer Grapples, running between Puget Sound and Alaska, burned and 70 lives lost.
4. Bakers' strike in Vienna. Earthquake in Tabriz, Persia, and loss of many lives.
5. The town of Königshof, in Bohemia, burned.
6. Navigation on Erie canal opened. The biennial budget rejected in the German Reichstag.
7. Defeat of the Apaches by Mexican troops.
8. Oil-tanks at Communipaw, N. J., fired by lightning.
9. Opening of the Fishery Exhibition in London, and of the Hygienic Exhibition in Berlin.
10. Devastating hurricane in Kansas, Missouri, Ohio, and Indiana; town of Oronogo, Mo., demolished.
11. Mahone accused of violating the civil-service law. Execution of Brady in Dublin. The Pope interdicts political agitation by the Irish clergy.
12. Tonquin credit votes by French Assembly. Lock-out of 4,000 shoemakers in Cincinnati. Prince of Montenegro visits Vienna.
13. Treaty of peace between Chili and Peru. National association of coal-miners formed in a convention at Pittsburg. French naval vessels bombard ports on the northwest coast of Madagascar.
14. Denver and Rio Grande railroad completed. Prussian proposals relative to the announcement of ecclesiastical appointments rejected by the Vatican. Swedish Second Chamber pass a bill to change the organic law of the army.
15. Severe storms in Wisconsin, Illinois, Nebraska, Missouri, and Texas. Execution of Daniel Curly in Dublin.

19. Destructive flood in Dakota. Entry of the Czar and Czarina into Moscow.

20. Tumultuous Labor Congress in Paris.

21. President Arthur appoints Walter Evans, of Louisville, to succeed Gen. Raum as Commissioner of Internal Revenue.

21. Administrative regulations of the new tariff announced by the Government. The Italian Ministers oppose Depretis and resign. Death of Suleiman Pasha in Constantinople.

22. Nomination of the Marquis of Lansdowne as Lord Lorne's successor in the governor-generalship of Canada. Reorganization of Italian Cabinet announced by Depretis. King and Queen of Portugal visit Madrid. Solemn entrance of the Czar into Moscow. The Swedish First Chamber rejects the measure to alter the formation and mode of recruiting the army.

23. Opening of the National Railroad Exhibition in Chicago. John Jay appointed New York State Civil-Service Commissioner.

24. Formal opening of East River Bridge between New York and Brooklyn. Miners' riot in Illinois. French belligerent action in Madagascar.

25. Steamer accident in California. Jewish persecutions in Rossow, Russia. Changes made in the Italian Cabinet. Prorogation of Dominion Parliament. Swedish Ministry resign in consequence of the vote on the reorganization of the army. Repulse of French troops in Tonquin; death of Rivière. Retirement of the Swedish Ministry. Death of Abdel-Kader.

27. Coronation of the Czar in Moscow, in the Kremlin Cathedral.

28. Tornadoes in Indiana; twenty persons killed. Popular vote in a referendum vetoes the law of compulsory vaccination in the Swiss Canton of Zurich.

29. Close of the Star Route trial. Tornado in Indiana, Ohio, and Arkansas.

30. Panic on the East River Bridge during a blockade of the foot-path; twelve persons trampled to death. Mineral exhibition opened by the King at Madrid in presence of the King of Portugal.

31. Sick-fund bill passed in German Reichstag.

June 1. Tariff reformers issue a declaration of principles. Prussian negotiations with Rome again broken off. The French bombard two seaports in Madagascar.

2. Flood in Council Bluffs, Ia. Hanging of Thomas Caffrey in Dublin. The Italian Chamber resolves to build a national monument to Garibaldi.

3. Change in the Brazilian Cabinet. Members of the Black Hand Society condemned in Spain.

4. Bill prohibiting political assessments passed by Pennsylvania Senate. Assassination conspiracy unearthed in Tipperary, Ireland. Carey expelled from Ireland. Proposal of a second Suez canal.

5. Suspicious cases of poisoning in Ireland.

6. Foraker nominated by Ohio Republicans for Governor. Judge Kinne chosen as Democratic candidate for Governor of Iowa. Thyselius entrusted with the formation of a Ministry in Sweden.

7. Sinking of the steamer Claudius on the British coast.

8. Preparations for war against France in China.

9. Timothy Kelly, the last of the Phoenix Park murderers, hanged. Execution of Suleiman Daoud in Alexandria.

10. Return of the Czar to St. Petersburg after the coronation festivities.

11. Fight of strikers in Troy, N. Y. Bennisen, the German party leader, retires from political life.

12. The German Reichstag closes its session after passing the budget for 1884-'85. The French capture Tamatave in Madagascar.

13. Acquittal of the Star Route prisoners. Successful termination of Gen. Crook's expedition against the Indians. Nutt shoots his father's murderer in Uniontown, Pa. Earthquake in the Bukovina. Admiral Pierre bombards and occupies Tamatave, in

Madagascar, and destroys also Toule Point, Mohambo, and Tenerive.

14. A Federal Judge in Texas declares the Civil-Rights Act of 1875 unconstitutional. Dr. Gallagher, the dynamite conspirator, and his accomplices condemned to imprisonment for life in London. Swedish Parliament closes its sessions.

15. The Prohibitionists of Ohio set up a separate ticket. The high-license bill goes into operation in Illinois.

16. Failure of the lard firm of McGeoch & Co. in Chicago. Kraszewski, Polish poet, arrested for high treason in Germany. Channel Tunnel reported dangerous by Parliamentary Commission.

18. Theatre panic in Cumberland, England; 197 children trampled to death.

19. Inundation in Silesia.

20. Deaths of Archbishop Wood and Gen. Ewing, and of Bishop Colenso of Natal.

21. Judge Hoadley nominated by the Democrats in Ohio for Governor. The Pope complains to President Grévy of the treatment of the clergy in France.

22. S. L. Phelps appointed by President Arthur Minister to Peru, and Richard Gibbs Minister to Bolivia. Floods in Missouri, Illinois, Kansas, Nebraska, and Arkansas. Anti-Jewish demonstration in Saint Gallen, Switzerland. Marine collision off Portland, England; 25 lives lost.

23. Irish citizens protest to the President against pauper immigration; measures against the abuse taken by New York. Stormy debate in the Spanish Cortes over a court scandal.

24. Louise Michel condemned in Paris to six years' imprisonment. The cholera breaks out in Egypt at Damietta.

25. Reduction of the number of internal revenue districts from 126 to 82. Passage of the new ecclesiastical law in Prussia. Fatal fire in a puppet show at Dervio, in Italy.

26. Supreme court of Ohio declares the Scott law constitutional. Accident on Northern Pacific Railroad in Montana, killing 18 Chinamen. Understanding arrived at between Russia and the Vatican.

27. The Republicans of Iowa renominate Governor Sherman, and declare in favor of prohibition and protection. Republicans of Minnesota renominate Governor Hubbard. Success of the Slavs in elections to the Bohemian and Galician Diets.

28. Rejection by the British House of Lords of the bill to legalize marriage with a deceased wife's sister.

29. The Küstrin fortress converted into an arsenal.

30. Count de Chambord taken ill. Spread of the cholera epidemic in Egypt; quarantine measures adopted in Europe.

July 1. The new tariff comes into operation.

2. Santa Fé celebrates the 333d year of its existence.

28. The Mahdi advances on Khartoum.

29. Project for the colonization of Algiers voted down in the French Chamber. Lieut.-Col. Sudeikin, of the Russian police administration, murdered by Nihilists in St. Petersburg.

F

FAILURES IN BUSINESS. The report prepared by Bradstreet's Commercial Agency, and published in its "Journal," shows that the business failures in the United States during 1883 greatly exceeded, in number and extent of liabilities, those of any preceding year since 1878, when the commercial depression following the panic of 1873 culminated. A comparison for the five years following 1878 is afforded by this exhibit:

YEAR.	Number of failures.	Assets.	Liabilities.	Percent. of assets to liabilities.
1879.....	6,659	\$43,906,000	\$99,684,000	49
1880.....	4,350	27,430,000	57,120,000	48
1881.....	5,929	85,964,000	76,094,000	47
1882.....	7,685	47,469,000	98,283,000	51
1883.....	10,299	90,804,000	175,963,000	52

The figures for Canada and Provinces for the same period are as follow:

YEAR.	Number of failures.	Assets.	Liabilities.	Percent. of assets to liabilities.
1879.....	2,075	\$16,198,000	\$32,356,000	50
1880.....	839	4,760,000	9,240,000	47
1881.....	607	3,278,000	6,122,000	54
1882.....	755	3,948,000	8,139,000	49
1883.....	1,464	12,867,000	22,156,000	56

Classified by quarters of the year, the number of failures in the United States in 1883 was as follows: First quarter, 3,189; second quarter, 2,107; third quarter, 2,062; fourth quarter, 2,941.

The following is a summary of failures in the United States, by States, geographical divisions, and chief cities, and also in Canada, for the year ending Dec. 31, 1883:

	No. failures.	Nominal assets.	Actual assets.	General liabilities.
N. E. STATES.				
Maine.....	249	\$1,972,727	\$1,421,728	\$3,047,660

* A large proportion of the failures classified as miscellaneous may be characterized as miscellaneous manufactures, including, as they do, makers of patented articles, novelties, and specialties not strictly under any class given above.

Commenting on the fact that the number of business failures in the United States in 1883 shows a large increase when compared not only with 1882, but also any preceding year, with the exception of 1878, Bradstreet's "Journal" explains that this exhibit is less startling when more closely examined. The number of legitimate trading concerns recorded in the Bradstreet Agency at the close of 1883 was 838,823, as compared with 548,180 in 1873, a gain of 290,643 in ten years. In 1878, at the end of a five years' depression in general trade, there was but a moderate gain in the number of business enterprises, while now the total number of traders having a distinctive place in the commercial and industrial community is 50 per cent. greater than ten years ago. Fully 60 per cent. of this development in trade has taken place since 1878. The expansion in business, extending over 1880 and 1881, was very great, and competition was keen, resulting in a continuous increase in the number of failures from year to year. The "Journal" says:

The enforced contraction in production during the past two years, shrinkage in prices, abuses of the credit system, and competition for the survival of

those firms which could work at the least expense and otherwise to the best advantage, have all tended to crowd the weaker trader or manufacturer to the wall. Thus, with from 180,000 to 200,000 new competitors within five years, the arrival of a period of enforced contraction of production, distribution, and prices, with a commercial obituary list of some 300 less than in 1878, can not be regarded as indicative of a radical unsoundness in the present business situation. As heretofore, the list of failures given includes none which have been the outcome of purely speculative dealing as a distinctive occupation. From this analysis some so-called business failures have been intentionally omitted as in no way forming a part of the mortality list in the legitimate commercial world. It should be borne in mind that it is a general rule with failing traders to swell the aggregate of liabilities in the event of disaster. We have previously defined a failure as that which has to be considered as a matter of record in the regular conduct of business of a mercantile agency. In preparing a list of mercantile traders it will be recalled that planters, other agriculturists, and those engaged in professional occupations, are necessarily excluded under the above definition.

The statistics for 1883 show two other noteworthy results: First, that the average proportion of indebtedness offset by available assets is larger than ever before, amounting to 52 per cent. Second, that there has been a striking increase in the percentage of liabili-

ties. This increase, with the increased per cent. in the number of failures during the past three years, has been as follows:

IN THE AGGREGATE.	1883	1882	1881	1880
Increase per cent. of number of failures.....	29	83	85	84*
Increase per cent. of liabilities..	88	23	83	23*

The average amount of liabilities per failing trader in 1888 was about \$17,000; in 1882 it was \$12,212; in 1881, \$12,800; in 1880, \$13,181; in 1879, \$14,970.

"The general improvement," says Bradstreet's "Journal," "in the record of 1880 as compared with 1879, as shown above, was fully offset by the increased mortality and losses in liabilities taking place in 1881. The number of failures from the latter date has increased in a like ratio in both years (1882-'88), but the increase per cent. of liabilities is strikingly large in 1883, the gross indebtedness of 1883 being nearly double that of 1882. There have been 33 failures during the year with liabilities aggregating \$37,000,000. With these omitted from the list, as being due to special causes, the increase per cent. in liabilities (total) in 1883, as compared with 1882, drops from 88 per cent. to 83 per cent."

Grouping the returns, as to average individual indebtedness and ability to liquidate, by geographical divisions, the exhibit is as follows:

TO EACH FAILING TRADER.	Average liabilities.			Per cent. of assets to liabilities.		
	1883	1881	1879	1883	1881	1879
	In New England..	24,183	11,765	16,488	89	41
In Middle States..	25,682	19,288	17,577	50	48	51
In Western States..	14,841	9,764	18,740	65	59	51
In Southern States..	10,602	12,425	18,270	48	55	54
In Pacific States..	8,507	8,167	11,892	52	88	47
In Territories.....	11,799	18,500	18,666	61	64	45

In New England, the record of commercial disaster during the year was 1 in every 61 engaged in business; in the Middle States, 1 in 104; in the Southern States, 1 in 69; in the Western States, 1 in 99; in the Pacific States, 1 in 80; and in the Territories, 1 in 15. For the country in 1878 the average was 1 failure for every 56 in business. The average throughout the United States in 1888 was 1 failure for every 82 traders.

At least 76 per cent. of the whole number of failures in 1888 were those in which the liabilities amounted to less than \$10,000. But 18 per cent. of the whole number had liabilities ranging from \$10,000 to \$25,000, and about 5 per cent. were individually indebted from \$25,000 to \$50,000 each. The proportion of failures in which the liabilities amounted to from \$50,000 to \$100,000 was but about 2½ per cent. of the whole, and of those whose liabilities were from \$100,000 to \$500,000 each the proportion was about 1½ per cent. only. This calculation indicates that more than 7,800 of the 10,299 failures reported in 1888 were those in which the debt in each instance did not exceed \$10,000; that more than

1,800 failing traders' liabilities were between \$10,000 and \$25,000; that in the case of more than 500 the debts were from \$25,000 to \$50,000; that 300 of the failures had debts from \$50,000 to \$100,000 each, and that the liabilities of less than 160 were from \$100,000 to \$500,000 each. The record of more than 10,000 business failures in 1888 is robbed of considerable of its apparent force by the fact that nearly 90 per cent. were of business houses which owed each less than \$25,000, and that the liabilities of six sevenths of the total so specified owed each less than \$10,000.

Not included in the above review are the thirty-three heaviest failures, the liabilities of each exceeding \$500,000. Of these, ten showed liabilities from \$500,000 to \$600,000 each; five, from \$600,000 to \$700,000; four, from \$700,000 to \$800,000; two, from \$800,000 to \$900,000; three, from \$900,000 to \$1,000,000; five, from \$1,000,000 to \$2,000,000; two, from \$2,000,000 to \$3,000,000; one, \$3,421,000; and one, \$7,509,000. The failures in which the liabilities reached \$1,000,000 were these:

	Assets.	Liabilities.
Union Iron and Steel Co., Chicago.	\$1,719,000	\$3,421,000
A. D. Smith & Co., cotton manufacturers, Providence, E. I.....	1,200,000	1,700,000
Frederick Mayer & Co., wholesale cloths, New York.....	1,250,000	2,000,000
Levy Brothers & Co., wholesale clothing, New York.....	1,500,000	1,600,000
James Marshall & Co., iron manufacturers, Pittsburg, Pa.....	1,200,000	1,900,000
George William Ballou & Co., bankers.....	800,000	1,000,000
C. W. Copeland & Co., wholesale boots and shoes, Boston.....	964,000	2,101,000
F. Shaw & Brother, leather, Boston.....	5,262,000	7,509,000
Benjamin Burgess's Sons, wholesale sugar, Boston.....	800,000	1,400,000

The thirty-three firms above referred to, owed about \$37,800,000 in the aggregate, or an average of about \$1,180,000 each. Of the total of over \$37,000,000 of debts, Boston firms are to be charged with \$11,662,000 directly due to the F. Shaw & Brother failure. New York's total is \$10,225,000, about one third of which was due to the Mayer and Levy embarrassments. Chicago ranks third, with \$4,512,000 liabilities, or about equal to the total liabilities of all kinds reported from Philadelphia. Thirty-one of the firms whose actual assets were reported, gave the total of the same at approximately \$20,000,000, as against \$36,000,000 aggregate liabilities, thus indicating a possible settlement at 55 cents on the dollar.

A valuable study bearing on the subject of commercial failures is afforded by an examination of the total number of traders and of failures in business in the United States, in 1880, in connection with the aggregate capital directly and indirectly invested in business in that year. The statistical returns of such capital, and also of the number of traders engaged in business, are reported for the first time by the Federal census of 1880. These

* Decline in number from 1879 of failures and amount of liabilities.

* Includes Dakota, Indian Territory, and Wyoming.

returns show that the total recorded number of traders in the United States, June 1, 1880—that is, those having a distinctive position in the commercial or industrial community—was 708,328. This means the number of business enterprises including incorporated companies and unincorporated business houses and firms. It does not, therefore, represent the number of individual traders, since many companies and firms are composed of two or more members each. The aggregate capital, including real estate and personal property, invested in business, was \$8,177,505,862. A comparison by States of the failures in 1880, with the number of traders and the amount of capital, will be found in the table in the preceding column.

From the table above, it is found that the total capital credited to the State of New York alone was in excess of the aggregate for all New England by nearly \$200,000,000, was more than twice as large as the total capital in the Southern States, was two thirds as great as the total for the Western States, and more than six times as large as the total for the Pacific coast. New York's share comprised 22 per cent. of the grand total of all the capital invested in business in this country in 1880. Massachusetts ranked second, with \$1,041,000,000, against \$1,822,000,000 invested in business in New York; Pennsylvania third, with \$867,000,000; Ohio fourth, with \$595,000,000; Illinois fifth, with \$486,000,000; and Michigan sixth, with \$800,000,000. The following is a comparison by geographical divisions of the percentage of aggregate capital invested in 1880, and of the total number of traders and of failures in 1880 and 1883:

STATES.	Per cent. of ag. cap. invested.		Per cent. of total number traders.		Per cent. of total number failures.	
	1880	1883	1880	1883	1880	1883
Eastern.....	20.5	19	11	14.6	14.6	14.6
Middle.....	34.5	29.7	28.9	20.9	22.6	22.6

Bradstreet's "Journal" says:

The total number of failures in business in 1880 was undoubtedly the smallest in any year since the similarly prosperous period in 1872. When trade is thus at the flood, many of the elements of disaster are for the time wholly absent. At such a time ventures are at the initial point, and actual disasters are of neces-

sity exceedingly limited. At a later period, when activity has become general and ill-judged ventures have reached the point of fruition or failure, numerous trade disasters come about as a matter of course, and this while the general condition of trade is exceptionally sound. The record of the past three years has verified the analysis. In 1880 failures were relatively few, while in 1883 they were about 2 4 times as many, activity and competition in production and distribution having become severe. The general average of failures for the United States in 1880 was one in every 162 traders. This, if compared with the estimated ratio for 1878, a year of heavy commercial disasters, and again with the past calendar year, is as follows:

	1878.	1880.	1883.
Ratio of failures to traders.....	1 in 66	1 in 162	1 in 82

The final column of the table given above shows the average amount of capital per trader by States, in round numbers, with averages by geographical divisions. It is interesting to note that Massachusetts leads among States with about \$27,000 capital per trader, and that Rhode Island is second with \$21,000. Connecticut with \$19,200 outranks New York by about \$2,000 per trader. Maryland ranks ahead of Pennsylvania, the former having \$15,900 average capital per trader to \$10,700 of the latter. California averages \$14,100, and Michigan \$11,100. For the United States as a whole the average capital to each trader or business concern is in round numbers \$11,600.

FINANCIAL REVIEW OF 1883. The record of 1883 is that of a growing commercial depression. The causes may be traced, not so much to excessive expansion during the brief tide of prosperity which reached its highest mark in

1881, as to the failure of crops from drought in that year, the losses of stock from frost and snow the following winter, the paralysis of the iron industry resulting from the cessation of railroad-building, and largely to the simultaneous depression in Europe and its effect on the exports and prices of American products. In the South, and in parts of the Southwest and West, where industrial expansion has proceeded at a rapid rate, the stringency was less felt, and in some trades and localities profits were still sufficient to encourage a continued extension of facilities. This transfer of productive activity to new centers was proportionally operative in producing the pressure under which Eastern trade and manufactures suffered.

Business failures increased in steady progression, from the minimum amount of liabilities, in 1880, of \$66,000,000, to \$81,000,000 in 1881, \$102,000,000 in 1882, and \$173,000,000 in 1883. (See FAILURES IN BUSINESS.) But there was nothing approaching the character of a financial crisis. A continuous decline in the values of stocks, in the face of the heaviest returns of railroad traffic and earnings ever made, was the most remarkable feature of the year. The safety of the financial institutions of the country is in a large measure involved in the fluctuations of stock-values; but it was a reassuring symptom that their operations were conservative enough to sustain so vast a shrinkage of values. There was no bank failure of magnitude or wide-spread influence, and none which was not due to the failure of isolated enterprises or speculative corners.

The following tabular survey of the economic conditions and results of 1883, contrasted with those of the preceding year, is taken from the "Commercial and Financial Chronicle":

DATA.	1882.	1883.
Coin and currency in United States November 1st.....	\$1,465,509,449	\$1,523,266,980
Total clearings in twenty-seven cities.....	60,908,000,000	51,502,000,000
Merchandise failures.....	101,547,064	173,000,000
Imports of gold and silver (eleven months).....	19,182,900	28,767,115
Exports of gold and silver (eleven months).....	54,000,489	29,629,847
Imports of merchandise (eleven months).....	693,310,224	682,995,212
Exports of merchandise (eleven months).....	675,021,019	719,539,625
Railroads constructed (miles).....	11,501	6,600
Gross earnings of sixty-four railroads (eleven months).....	\$245,891,143	\$269,816,699
Wheat raised (bushels).....	502,000,000	400,000,000
Corn raised (bushels).....	1,624,000,000	1,551,000,000
Cotton raised (bales).....	6,992,234	6,000,000
Pig-iron (tons).....	4,623,828	4,623,000
Anthracite coal (tons).....	29,239,919	31,200,000
Immigration (eleven months).....	686,676	584,430

The prices of the leading staples on or about the 1st of January, 1884, compared with prices at the same date in 1883 and 1882, were as follows:

MERCHANDISE.	1882.	1883.	1884.
Cotton, middling uplands, per pound.....	11 $\frac{1}{2}$	10 $\frac{1}{2}$	10 $\frac{1}{2}$
Wool, American XX, per pound.....	37 @ 45	35 @ 43	23 @ 41
Iron, American pig, No. 1, per ton.....	25 00 @ 27 00	25 00 @ 26 00	29 50 @ 31 50
Steel rails.....	59 00 @ 60 00	40 00	38 00 @ 35 00
Wheat, No. 2 red winter, per bushel.....	1 41 $\frac{1}{2}$ @ 1 43 $\frac{1}{2}$	1 04 $\frac{1}{2}$ @ 1 10 $\frac{1}{2}$	1 10 $\frac{1}{2}$ @ 1 12 $\frac{1}{2}$
Corn, Western mixture, No. 2, per bushel.....	71 @ 71 $\frac{1}{2}$	66 $\frac{1}{2}$ @ 66 $\frac{1}{2}$	62 $\frac{1}{2}$ @ 64
Pork, mess, per barrel.....	17 50 @ 19 50	18 37 $\frac{1}{2}$ @ 18 50	14 75 @ 15 25

The Banks and the Money Market.—In no year since 1878 was money more uniformly easy throughout the year, or the market less sub-

ject to violent fluctuations, than during 1883. There was a temporary stringency in March and April, when call loans, which had been

quoted at 2 per cent. on Government bonds and 5 per cent. on other collaterals during the previous part of the year, were taken in Wall street at rates ranging on some days as high as 30 and 25 per cent. per annum. After nearly three months of fluctuation the price settled down for the summer to from 1 to 3 per cent. When the autumn depletion for the crop movement occurred, which is usually the opportunity of the bears, the supply was too abundant for any manipulation, and money could usually be obtained on collaterals at the same rates, on no occasion rising above 4½ and 5 per cent. The closing quotations of the year were 1 to 3 per cent., the lower rate applying, as usual, to loans on Government bonds. The dealings in commercial paper became more and more restricted and cautious as the year advanced. This shutting off of accommodation precipitated the embarrassments of weak traders, and swelled the total of mercantile failures. A considerable proportion of the insolvent merchants owed their bankruptcy to speculations outside of the sphere of their legitimate business. This "weeding-out" process produced no perturbations, and, instead of betraying weakness in the financial machinery of the country, was an encouraging proof of its sound

and conservative workings. The failures resulting from the miscarriage of wheat and lard corners were self-limited. The bonded whisky question and the fate of the gigantic speculations in that product involved the banks more seriously. The decline in stocks was considered by many to have reached a point which endangered the stability of the credit institutions. Yet there were evidences that the bankers amply discounted the decline, and placed themselves in a position of safety more assured at the close of 1883 than at any previous time. By dropping questionable securities and requiring wider margins, they contributed in no slight measure to the decline and weakness of the stock-market.

Prime commercial paper was discounted in New York at 5 to 6 per cent. in January, 5 to 5½ in February, 6 to 7 in March, 5 to 6 in April, 5 to 6 in May, 4 to 5½ in June and July, 4½ to 6½ in August, 5½ to 6½ from September to November, and 5 to 6 at the close of the year.

The condition of the New York Clearing-House banks, and the rates of money and exchange, with the prices of United States bonds, on or about the 1st of January, 1884, as compared with the two years preceding, are given in the following summary:

	1882.	1883.	1884.
NEW YORK CITY BANKS:			
Loans and discounts	\$915,448,400	\$311,071,900	\$327,585,700
Specie	57,782,500	57,827,100	60,468,100
Circulation	20,162,400	17,625,500	15,456,800
Net deposits	289,520,400	291,668,600	320,798,000
Legal tenders	18,942,000	18,664,200	26,479,100
Legal reserve	72,472,800	72,915,900	80,193,250
Reserve held	72,724,500	76,291,800	66,947,200
Surplus reserve	\$1,251,900	\$2,875,400	\$6,748,950
MONEY EXCHANGE, SILVER:			
Call loans	3 @ 6 + ½ p. d.	3 @ 12	1 @ 2½
Prime paper, sixty days	6 @ 6½	6 @ 6½	5 @ 5½
Silver in London, per ounce	51½ d.	51 d.	51 d.
Prime sterling bills, sixty days	4 81	4 81	4 82½
UNITED STATES BONDS:			
3s, registered, option United States	102½	100½
6s, currency, 1893	129	183	184
4½s, 1891, coupon	114½	118	114½
4s of 1907, coupon	117½	119½	122½

Appended is the Clearing-House statement of totals at the beginning of each quarter of 1883 and at the end of the year:

DATE.	Loans and discounts.	Specie.	Circulation.	Net deposits.	Legal tenders.
December 30, 1882.....	\$311,071,900	\$57,627,100	\$17,625,500	\$291,668,600	\$18,664,200
March 31, 1883.....	310,180,100	49,056,800	16,574,800	279,944,200	16,801,900
June 30, 1883.....	328,088,200	64,189,600	15,612,600	324,280,900	26,122,800
September 30, 1883.....	329,764,000	55,824,400	15,198,500	314,107,500	24,077,900
December 29, 1883.....	327,585,700	60,468,100	15,456,800	320,798,000	26,479,100

Foreign Exchange.—The imports in 1883 were considerably less than in the previous year, while the exports were greater. In the later months of the year the export movement of merchandise diminished. The returns for eleven months of the calendar year show an excess of exports amounting to \$86,534,418, against an excess of imports in the corresponding pe-

riod of 1882 amounting to \$18,827,238. The bullion movement shows a net importation of \$5,137,268 for the same months of 1883, against an excess of exports during eleven months of 1882 amounting to \$34,817,589. The foreign commerce of the country does not alone govern the exchange market. It is materially affected by the movement of Ameri-

can stocks and bonds to and fro between New York and European financial centers. This movement has attained large dimensions of late years; but there is no record of such shipments, or means of estimating their amounts. Bankers' bills on London sold at stiff rates in May, June, and July. It was therefore believed that large amounts of securities were sent home from abroad. After July, rates weakened. An import movement in gold, of moderate dimensions, continued for a brief period and then fell off. The rate of sterling exchange for sixty-day drafts was \$4.81 at the beginning of January, rising to \$4.88 in the middle of the month, and \$4.88½ in the beginning of February. Lower and variable rates obtained in the next two months, falling to \$4.81 in the latter part of March, after which the rate quickly rose to \$4.84 in April, and, after falling ½ cent, advanced to \$4.85½ in the middle of May and \$4.86½ in the first part of June; \$4.85½ ruled for the next month, and after the middle of July \$4.84; \$4.88 in the latter part of August; \$4.82½ in the beginning, and a cent higher at the close of September; \$4.82½ and down to \$4.81½ in October; and from \$4.82 to \$4.88 through November and December.

Manufacturing Industries.—Industrial enterprise flagged, and manufactures, confronted with a failing demand, experienced the most unprofitable and discouraging year since the crisis of 1873 and the following period of despondency. Distributing merchants, under the influence of descending prices, took no more goods than were necessary to supply immediate demands. Manufacturers were therefore obliged to carry heavy and constantly accumulating stocks, or reduce production. The more expanded and venturesome concerns broke down under the strain, and made up the bulk of the mercantile failures. A downward movement in prices began in 1881. In 1888 competition became so sharp that profits nearly vanished in many branches of trade. Yet so great was the faith in the inherent strength of the situation, and the expectation of a speedy recovery so general, that manufacturers continued to produce to their full capacity. While goods were being turned out in undiminished and often on an increased scale, and pressed upon the falling market, or stocks accumulated for the expected upward turn, there were evidences everywhere of dwindling consumption. The failure of the harvests in 1881, the lessened demand for American staples in Europe, in consequence of better crops there and of a depression which was in a large measure the reaction of American agricultural competition, the prostration of the iron trade, the crises in the speculative markets and their train of mercantile disasters, were some of the depressing influences which caused a diminution in the consumptive capacity of the country. A far-reaching and persistent cause was contributed by the manufacturers and traders themselves, who, in order

to keep up their productive activity and carry their accumulated stocks, cut down their wages accounts and practiced the sharpest economies. The reports of railroad receipts and traffic furnish conclusive evidence that the volume of business was as great as in the most prosperous years.

The decline of railroad construction was one of the chief elements of disturbance. The undue expansion of the iron industry to supply this temporary demand was followed by a reaction in this trade which led off, and to a considerable extent helped produce, the general industrial depression. The reduction of railroad construction from 11,591 miles in 1882 to 6,600 miles in 1888 decreased the distribution of money for this purpose among manufacturers, transportation companies, contractors, storekeepers, laborers, etc., from \$347,780,000 to \$198,000,000. If construction falls off to 3,000 miles in 1884 it makes a further difference of \$108,000,000 in the disbursements. Steel rails were worth \$71 a ton in January, 1880; in December, 1888, large contracts were taken at \$83 and \$35 a ton. American pig-iron fell from \$35 to \$20 a ton. On the 1st of January, 1888, there were 417 furnaces in blast, and 270 out of blast, in the United States. By the 1st of July 88 more were blown out; but between that date and November 1st the number in operation was reduced by only three. The stock on hand on January 1st was 383,655 gross tons, increasing to 528,590 tons on July 1st, after which it was reduced until only 232,854 tons remained unsold on November 1st. The reduction in production was so great that consumption required more than the new supply, and prices showed an upward tendency in the latter part of the year.

New mining districts, opened up in various parts of the country with the extension of railroads, begin to affect the supremacy of the old center of iron production. The furnaces of Western Pennsylvania work mostly Lake Superior and imported ores. In the Clearfield district in Pennsylvania iron, coal, and limestone are found together. Another new field is in Southwestern Virginia, where the rich mineral deposits have attracted a large amount of capital, American and English. The pig-iron industry of the Southern States has developed even more remarkably than other branches of trade. The production increased in one year 25 per cent. The cost of negro labor is lower than that of labor at the North, while the quality of the product can bear comparison with the best grades of English Cleveland iron.

The anthracite-coal trade showed a development in 1888 which made it an exception to other industries. The mining and transportation companies, led by Philadelphia and Reading, pushed their productions to the utmost, sending to market about 81,200,000 tons in 1888, against 29,289,919 tons in 1882. A much larger tonnage than usual was shipped westward, necessarily competing with the soft coal

which was selling at low prices in the Western markets. Other mineral industries suffered under a general stagnation.

The cotton and woolen trades were later in discovering overproduction, and slower in curtailing it. But before the end of 1883 the necessary process was under way. Prices fell to a point where exportation can relieve the country of the oversupply. The manufacturers reduced their accumulations by auction-sales, and offered blocks of unprecedented magnitude, which sold below current rates, but not with the demoralizing effect that many feared.

The Crops.—The agricultural products of 1883 were but slightly above the average. The yield of corn, wheat, and cotton was about the medium, and fell far below the crops of 1882. The corn-crop was 373,000,000 bushels less, but the deterioration caused by rain and frost makes the deficiency much greater. The receipts of grain and cotton during the last five months of 1883 were very heavy, leaving a smaller proportion than usual in the hands of the farmers, indicating that the movement will be light and the deficiency of the crops strongly felt in the remaining months of the crop year. Of the minor cereal crops and of potatoes the yield was abundant.

The Stock Market.—The year 1883 was characterized by a more general, persistent, and severe decline in the prices of stocks than in any year since the depression of 1873-'78. A mass of stocks and income bonds had been floated on the market which could not possibly pay dividends in four or five years. Recent consolidations and extensions had given railroad managers an opportunity to supply the public with these watered stocks during a period of prosperity and speculation at double the prices to which they fell in 1883. The total amount of new shares and securities placed upon the market in two years was probably not less than \$2,000,000,000. The holders of this speculative material were anxious to sell whenever prices recovered, and by such an attitude checked any tendency to a rise. Mercantile profits had fallen away, and there were comparatively few who still disposed of the means to carry on Wall street speculations. Heavy losses in speculations during the last four months of 1882 emptied the street of petty operators. The market opened in January with a weak and vacillating tone. In the absence of transient buyers for speculative purposes, the great operators were unable to strengthen prices or took no pains to do so. There were signs of renewed activity in March, but the movement was checked by a tight money-market. When the stringency relaxed there was a brief activity, followed by complete lassitude. Large operators were supposed to have utilized the opportunity to unload a part of their holdings. A tendency to an upward movement manifested itself in June, but a reaction set in immediately. Toward the end of July, when "bear" speculators attempted to force prices to a lower

level, they were effectually resisted by large operators who wished to sustain the stocks in which they were particularly interested. The slight effect of the telegraph employes' strike on the price of Western Union stock revealed the extent of the control of the chief holders over this stock. The prolonged dullness of the market was reflected in a decline in the value of seats in the Stock Exchange, which were sold in July as low as \$28,000. The exceedingly favorable semi-annual reports of railroad earnings failed to invigorate the market. In August there was a sudden decline in Denver and Rio Grande, and a heavy block of this stock was believed to have been purchased in the interest of the Union Pacific, to prevent the road from falling under the control of any rival corporation. The "bears" attacked also the Northern Pacific and Oregon Transcontinental. The following month, while the ostentatious opening of the Northern Pacific was taking place, the attack was vigorously renewed. The speculators for a fall selected these stocks on account of the difficulties in which Mr. Villard had involved them in order to complete the Northern Pacific railroad. The object was, by causing a break in them, to effect a sympathetic decline in the rest of the list. The announcement in October of the issue of \$20,000,000 of new bonds on the Northern Pacific property removed the last prop, and with the heavy decline in these stocks nearly the whole list went down. The margins on stocks were to a large extent wiped out when the decline took place. The bears conducted their operations on a vast scale. Such activity had not been witnessed in many months. The result was that the market was largely oversold and the bear influence paralyzed for the remainder of the year. The opposite party seized the opportunity to give them a "twist" in some of the oversold stocks. Prices rose in consequence to an abnormal level, Northern Pacific advancing from 56 to 78½ and Oregon Transcontinental from 34½ to 51. Mr. Vanderbilt entered the market as a buyer and called in his loans, with the effect of advancing Michigan Central from 77 to 96½. The high prices were not long maintained. A bull movement started in the beginning of November soon gave out. At the close of the year dissensions among the railroads caused a renewed depression. The Northern Pacific stocks and Union Pacific fell off among other stocks, and in some cases the lowest level was reached.

The total sales of stocks at the New York Stock Exchange during the year 1883 were 96,087,905 shares, against a total of 113,720,665 shares in 1882, 113,392,685 in 1881, 97,200,000 in 1880, and 74,166,652 in 1879. The most active stock during 1883 was Delaware, Lackawanna, and Western, of which nearly 16,000,000 shares were dealt in, exceeding in amount thirty times the capital stock.

The following is a list of quotations of the leading stocks on or about Jan. 1, 1882, 1883, and 1884:

RAILROAD STOCKS.	1882	1883	1884
New York Central and Hudson River..	180½	126	119
Erie (New York, Lake Erie, and Western).....	40½	86½	26½
Lake Shore and Michigan Southern.....	112½	112½	94½
Michigan Central.....	86½	98	85
Chicago, Rock Island, and Pacific.....	181½	125½	116½
Illinois Central.....	129½	142½	182½
Chicago and Northwestern, common.....	126½	184½	116½
Chicago, Milwaukee, and St. Paul, common.....	106	105½	92
Delaware, Lackawanna, and Western.....	127	128½	116½
Central of New Jersey.....	90½	69½	84½

The following is a list of some of the speculative stocks, with the prices which they brought at some time during 1882, and those to which they fell in December, 1883:

RAILROAD STOCKS.	1882, highest.	Dec., 1883, lowest.
Canada Southern.....	72	50*
Central of New Jersey.....	97	58½
Chesapeake and Ohio.....	27	14
Chesapeake and Ohio, 2d preferred.....	29	16
Denver and Rio Grande.....	74	22½
Hannibal and St. Joseph.....	110	85½
Indiana, Bloomington, and Western.....	49	17½
Lake Erie and Western.....	45	18½
Louisville and Nashville.....	100	48½
Louisville, New Albany, and Chicago.....	73	30
Memphis and Charleston.....	82	32
Missouri, Kansas, and Texas.....	42	20½
Nashville, Chattanooga, and St. Louis.....	37	54
New York, Lake Erie, and Western.....	48	26½
Northern Pacific.....	54	23½
Northern Pacific, preferred.....	100	41½
Oregon Transcontinental.....	98	29½
Oregon Railway and Navigation Company.....	168	90
Ohio Central.....	25	2½
Ohio and Mississippi.....	43	21
Richmond and Danville.....	250	54
Richmond and West Point Terminal.....	268	28
Texas and Pacific.....	55	17½
Wabash.....	39	17
Wabash, preferred.....	71	29½

* Ex-dividend.

Railroads.—Railroad traffic and earnings in 1888 exceeded those of any previous year. Tonnage was heavy, from the large crops of 1882, an active movement of merchandise of all kinds, an exceptionally large coal-traffic, and the early movement of the crops of 1888. Immigration and the settlement of new lands contributed considerably to the traffic. Passenger business was also heavy. The many new lines recently opened made the competition severe, and toward the end of 1888 signs of new ruptures in the pools and combinations disclosed the extent to which roads had been constructed beyond immediate requirements, and consequently depressed the values of stocks. The stocks of railroads which were subjected most to new competition suffered

most in the general decline. The New York Central was threatened by the new West Shore road. The Union Pacific was affected by the opening of the Denver and Rio Grande to Salt Lake City, the Central Pacific by the completion of the Southern Pacific, and by the approaching completion of the Northern Pacific. The rivalry between the Pennsylvania and the Philadelphia and Reading led to sales of stock; and lines like the Erie and St. Paul, which were subjected to the brunt of competition or undermined by tariff wars, were the easy prey of the bears.

The completion of the "Nickel-Plate" railroad and the opening of the Chicago and Atlantic route by the Erie, made six through routes to contend for the Chicago traffic instead of four. The Pool Commissioner adjusted the proportions of the roads accordingly, but rumors and accusations of rate-cutting and evasions were rife during the latter half of the year. The Delaware, Lackawanna, and Western was subjected to the severest penalty in the power of the commissioner, viz.: the refusal of connecting lines to forward its freight except at local rates, and some of the trunk-line managers appealed from the award of percentages on east-bound business.

In November a conflict broke out in the principal Western pooling association. The Chicago, Milwaukee, and St. Paul announced its intention of withdrawing from the Iowa pool. The Northwestern, the Rock Island, and the Burlington and Quincy roads showed dissatisfaction with the arrangements. An agreement was formed between the St. Paul, Rock Island, and Union Pacific, excluding the Northwestern and Chicago, Burlington, and Quincy.

The gross earnings of the four great trunk lines leading into New York in the four years ending with 1888, a period marked by one deficient harvest, increased competition of the water-route from the abolition of tolls on the Erie canal, a protracted and bitter war of rates, and a progressive depression of industry, nevertheless show an increase from \$91,750,000 dollars to \$127,875,000, or 40 per cent. Net earnings during the same period increased from \$37,000,000 to \$48,000,000 dollars, but since the first augmentation of traffic in 1879-'80, when wages and materials were still low, the increase in operating expenses has kept pace with the growth of the business. The following statement gives the reported receipts and profits of these arterial lines:

TRUNK LINES.	1878-'79.	1879-'80.	1880-'81.	1881-'82.	1882-'83.
Pennsylvania:					
Gross earnings.....	\$23,222,026	\$40,358,679	\$48,984,896	\$47,122,715	\$51,064,955

The returns of fifty-six other railroads show an increase in gross earnings of from \$263,750,000 in 1882 to nearly \$291,000,000 in 1883. The railroads of the Northwest make the most favorable exhibit, as this is the part of the country which has been most rapidly developed by immigration and settlement. The agricultural and industrial development of the Southwest, and the progress in many of the older settled portions of the South, are reflected in the railroad reports. The elaborate net-work in the States of Ohio, Indiana, and Illinois proved to surpass their needs when in 1883 there was another short crop.

The railroad properties stood the strain of the present depression, instead of defaulting and going into liquidation as in 1873-'78, for the reason that the powerful combinations of capital which have consolidated vast railroad systems, covering whole sections of the country, have taken into their systems the smaller and less remunerative lines, and since 1879 have conducted the greater part of the railroad extension. This is the reason why over 25,000 miles of new railroad could be built between Jan. 1, 1881, and Jan. 1, 1884, in a time exceedingly unfavorable for floating new enterprises, while there was a constant decline in the market values of securities, without producing the disturbance and collapse which followed the crisis of 1873. In the preceding period local capital, individuals who traded on their ideas rather than on their capital, and speculative investors who were quick to take alarm, stood behind the new mileage, constructed in fragmentary lines which were able to co-operate only in a cumbersome way, and were easily betrayed into antagonism. The solidarity, organization, and economy of the present system are in every way advantageous. In regard to the construction of new roads the money borrowed for the purpose is obtained on the credit of the old paying concerns with a saving, taking the rates at which the bonds are issued into consideration, of probably 2 per cent. in the interest, while the bonus given with the bonds, in the shape of stock or income bonds, does not require compulsory payments which add to the fixed charges. The mileage is laid out more intelligently, with less sinking of capital in duplicate or unnecessary lines, while nearly all of the new roads serve as feeders to the stem lines under whose auspices they are constructed, and often produce profits when their own business is conducted at a loss.

The manner in which auxiliary lines are acquired and controlled affords railroad managers an opportunity to carry out designs for their private emolument, and involves in uncertainty the values of all the properties. The subsidiary lines are not as a usual thing incorporated in the parent or purchasing company, but are controlled by acquiring a majority of their stock. The enormous blocks of the stocks and bonds of minor corporations

held by many of the leading companies are in a number of instances unrepresented in the capital or debts of the latter, but are carried on the books as a surplus, which may be increased or diminished at the option of the managers. In all cases the stockholders are ignorant of intended new operations of this kind. The remaining owners of the securities of branch lines are at the mercy of the managers of the controlling company, who by withholding traffic can depreciate stocks which they wish to acquire privately. The affairs of companies are sometimes further complicated by the creation of intermediary corporations, such as the Pennsylvania Company, which operates the branch lines of the Pennsylvania railroad west of Pittsburg, the Oregon Transcontinental, formed to work the combined Oregon Navigation and Northern Pacific properties, and the similar concern which manages the connecting lines of the Richmond and Danville. The securities held by sixteen large corporations aggregated \$383,000,000 in January, and if the holdings of four others, of which the public could obtain no satisfactory knowledge, were added, the amount would be at least \$450,000,000. The income from these investments is often an important item in the accounts of a company, supremely so in the case of the Pennsylvania, which received in this way \$3,500,000 in 1882, equal to 4 per cent. on all its outstanding stock, and in that of the Union Pacific, which received nearly \$2,250,000. One use to which these assets are sometimes put is to pledge them for new loans, called collateral trust mortgages, as has been done by the Oregon Transcontinental, the Union Pacific, the Wabash, and other companies.
